We donot now propose to enlarge upon the rights and wrongs of the Irish people, but their deplorable situation may well induce grateful feelings in the hearts of American farmers for the independence they enjoy. Relief for the suffering should now be the uppermost thought, and the abundant harvest of last season will enable our farmers to contribute liberally, and we feel assured they will do it cheerfully. James Gordon Bennett, proprietor of the New York Herald, has headed a subscription list with the magnanimous gift of $100,000.00 and invites contributions to swell the sum to at least a million dollars. Let everyone contribute his mite, and do it without delay.

HOW OTHERS SEE US.

"To see ourselves as others see us," is a most valuable piece of self-knowledge and perhaps there are no other people in the world who are better pleased to be disciplined in this way and to accept just and wise criticisms with good nature and a desire to benefit from them than Americans. Criticisms are not always wise or just, and we have had our share of those which were offensively unjust and prejudiced. Among this class, however, we cannot admit the opinions formed and expressed by Mr. Clare Sewell Read, one of the English special Commissioners who recently visited this country on a tour of observation. From a knowledge of Mr. Read's character we hoped much from this visit and we are not disappointed. A true idea of the vastness of the material interests and necessary future development of the resources of America as well as of the personal character of Americans will go far to remove erroneous and prejudiced opinions and put us on a fair and favorable basis with a people with whom we have done, and must in the future do, our most profitable business. The changed condition of our business relations which have arisen very recently, make this understanding both desirable and necessary and Mr. Read's experience will have an important weight in creating a just popular opinion in England as to American people, matters, and things in general. Mr. Read has recently met his constituents whom he represents so well and effectually in the British Parliament; and has reported to them in an informal way some of the results of his visit here. His report is both instructive and amusing. One of the justest remarks of this gentleman was in regard to our much criticised Department of Agriculture, and this testimony is worthy of regard as showing how in these days, as in the old, "a prophet is not without honor save in his own country and among his own people." He testified to "the great efficiency and usefulness of the American Department of Agriculture," a compliment we think deserved, and one that comes very graciously from so observant a man and so accomplished and thorough a farmer as Mr. Clare Sewell Read. Without taking up time and space to notice fully Mr. Read's opinions about us, we may congratulate ourselves that so sensible a man was commissioned to examine our condition. His practical conclusion is, as might have been expected; that with a country where an Englishman might well believe himself to be at home, the language, manners, to a great extent and the laws being very much the same as those of his own country; with a surpassing business energy and activity, and a land illimitable in its resources, agriculturally and otherwise, competition in the production of the chief staple foods is practically hopeless, that we can produce meat and bread more cheaply than any other country in the world and that we are in a fair way to be very soon independent of the world in manufactured articles. Finally, he thinks, it may be, as we expect to see it, that we shall be in a position to supply England with food and take nothing but gold in payment for it, supplying ourselves with all we need. And so think we all of us.

UTILITARIAN FISH-CULTURE.

The efforts of the United States Fish Commissioner to naturalize the European carp in American waters, and particularly the recent announcement that the fish are ready to be distributed from the Government breeding ponds to all parts of the country, mark a new stage in the history of American fish-culture. The game fishes have already had their chance; they have been bred and distributed far and wide, largely in the interest of sportsmen, but we have come at last to a question of pure utility.

The carp is a domestic fish belonging to the shiner or goldfish family, but of considerable size and, when in season, excellent as food. They affect quiet waters with soft or muddy bottoms, where, in Europe at least, they spawn in early summer. Naturally, the carp feeds upon insects, worms, seeds, and soft plants such as duckweed; but when kept in artificial ponds, the fish will eat almost anything. In Europe they are sometimes fed with flesh from slaughter-houses, but more commonly with the young leaves of clover, lucerne, peas, beets, or buckwheat. Brewers' grains, malt-sprouts, and a great variety of other vegetable matters are likewise used. It is said that the fish do not eat the leaves until they have begun to decay. A good food in this country would be the menhaden fish-scrap, now used as manure. Probably, the meat-dust fertilizer prepared at the slaughter-houses would serve a good purpose, also. Carp are said to be fond of cow-dung and the dung of other farm animals, and to thrive when fed upon dung. They are fond of dor-bugs withal, and such-like insects.

The carp increases rapidly and grows fast. At least 20,000 individuals are said to have been reared at Washington in two years from the 120 fish which were put into the Government pond in 1878. The rapid rate of increase is well shown by the experience of Mr. Levi Davis of Forestville, Sonoma Co., California, as reported in the Pacific Rural Press of January 3, 1880. In January 1876, Mr. Davis bought six carp for $30. One of these fish soon died, but in the course of the year there were reared 2,044, and in 1877, 2,672 young ones from the five old fish. In the spring of 1878 Mr. Davis gave away two of the old fish and still reared 4,000 in that year, from the three old fish he had left. He has not yet counted the crop of 1879. These results were obtained in four small ponds, which cost altogether $200; and the food of the fish is estimated to have cost $10 a year; that is to say, the total cost of fish and ponds to date is $270. Meanwhile, Mr. Davis has sold $415 worth of fish, and he has left his four ponds, 6,000 or 8,000 carp, and $145 cash in hand; in addition to which his family have been eating carp freely for eighteen months. He warmly commends carp-culture to every one who has ponds fit for the purpose, and urges that the carp bears heat extremely well, and will thrive in waters where other fish could hardly exist. His experience is interesting and instructive, though almost too good to last. It is well enough to remember that "there be land-rats and water-rats, land-thieves and water-thieves;" in a word, that the fish-culturist has many foes. What with the summer's heat and the winter's cold; what with our heavy rains to bring mud and silt into the ponds, and freshets to wash away the fish; what with musk-rats to undermine embankments; and the ravages of predatory fish and of fishing birds, it will ill-become the pond owner to sleep too soundly o' nights. Besides gulls, and loons, and the other migratory fish-eating birds, there are crows, herons, kingfishers, and fish-hawks to be looked after; and mink and otter, as well, to say nothing of the angler's rod and the poacher's night-lines. But here, as everywhere, we may find comfort in the adage, "nothing venture nothing have," and rest assured that with due care and proper attention, most difficulties may be overcome. We make no doubt that the carp will be a great addition to the food resources of the country, and that many farmers will find it both convenient and profitable to undertake this form of really useful fish-culture.

BREVITIES.

There is a fine show for wheat in Ohio, according to the statements of our many correspondents from that State.

Grafting Wax.—The following old recipe is as good as any we know of: Two parts of tallow, three of resin, and three of beeswax.

Attention is called to our notices of nurserymen's and seedmen's catalogues this week. Our readers should inform themselves thoroughly before making out their orders.

Last summer for the first time we raised (from seeds) the Turnip-rooted Celery, or Celeriac, advertised in every seedsman's catalogue. We need not tell a long story about that which may be stated in a few words. We shall never again raise Celeriac while we can raise Celery

"Be it known to all men that the great majority can no longer Farm to a Profit. We state, indeed, our grave conviction that in no walk of life is it now more difficult to make a living than by farming." Thus frankly speaks the Agricultural Gazette of London, England.

The question is asked in England: Has it been proved by any competent experimentalist, that the potato can be improved by selection from the tubers? Another question we would ask: Has it been shown that the planting of small potatoes, year after year, will ultimately lessen the size of the crop?

Our readers will think well of the subject "Reclamation of bog-land," as treated by Professor F. H. Storer on our first page of this issue. We have seen in American papers no other coherent and sufficient account of this most important system of husbandry which seems destined to play a great part in the world.

Publishers of the Rural New-Yorker, New York City—Gents:—We have sold over 100 scales since last September, and are fully assured that at least three-quarters of these orders came from our last advertisement in your valuable paper. The Rural we find to be the best advertising medium that we have ever used. Osgood & Co.

Binghampton Scale Works, Binghampton, N. Y.

It seems that the fruit of the Japan Persimmon is not fit to eat until after it has been exposed to frost. The red, tomato-looking fruit, as shown in colored plates of some catalogues, is not the Japan (Diospyros Kaki), but the China or Mongolia Persimmon, D. Schi-tze. This latter is said to be hardier than the other. The fruit rarely contains seed. Kaki persimmons always contain seeds, as we have before remarked.

The parentage of the Kieffer Pear on the male side at least—is guesswork. It is probably a hybrid, but even this is not known. The word "sport" is used to express a bud variation of which nothing further is known. Such variations may be a cropping out of crosses made years previously, the same as sometimes happens in thoroughbred animals; that is, a sudden power or impetus is given to blood which for years previously had, so to speak, remained impotent. But as we do not know this, the word "sport," as the name of an effect the causes of which we do not understand, is very good. But the word hybrid has a well defined signification. For the sake of the accuracy of pomological history, we think the pear in question should be called simply Kieffer's Seedling.

Industrial Societies.

FRUIT GROWERS IN COUNCIL.

New Jersey Hort'l Society.

EVENING SESSION.

(Rural Special Report.—Continued from last week.)

THE early part of the evening was devoted to the ornamentals. The Secretary read an anonymous contribution from a lady friend of the Society on "Old-fashioned Flowers" and one from P. B. Mead on the culture of plants in our living-rooms. There was also a brief essay on the Decoration of Small Places. Discussion followed.

Mr. Crane would caution against planting the Willow near a well. He had one 20 feet distant from a well 20 feet deep. The roots ran to the bottom, drank up the water, and filled the well with fine fibrous roots which had to be cut out repeatedly, and made the water unfit for use. [We know of a similar case where the tree was 100 feet from the well.—EDS.]

Mr. Ward named the Chinese Arbor-vitæ as one of the beautiful evergreens for ornamental purposes.

Mr. Lovett indorsed all that was said as to its beauty, but it was not hardy. He recommended Maiden Hair tree, Magnolias Lenneï and stellata, The majestic Grandiflora, though popular at the South, is not hardy here, but Mr. Parry cited a specimen near Philadelphia 20 feet high, flourishing and beautiful. [We think that that tree is not living now.—EDS.]

The best way to use ice to preserve fruit was asked for.

Mr. Goldsmith used boxes holding a bushel each, placed them four deep on the ice, and had generally been very successful.

Mr. Ward had found that the use of ice under the fruit was only necessary to cool off the warm air arising from the earth. With a temperature of about 34°, and other favorable conditions, he did not see why Bartletts or any other pears could not be kept six or eight months.

Mr. Capen asked what effect this frigid temperature had on the quality of fruit. His impression was that the fruit-houses of Mass. were not as successful as expected on account of impairing the quality of the fruit. Mr. Ward thought otherwise and desired the fruit to be tested then and there to settle the point if possible.

Samples were distributed among the audience and Mr. Capen admitted it was better than he expected. He also distributed samples of his fruit of the same varieties, kept without ice, and the only noticeable difference was due to a different degree of ripeness. He once sold 12 bushels of Bartletts for $12 per bushel, but never expected to do it again. Would pears ever rule as low as apples?

Mr. Ward had sold Bartletts for $37 per bbl.; but the general average was $7 to $8. Was not certain but they could be grown as cheaply as apples, and maybe, sold as low at their natural season. If so, the profit could only be obtained by keeping them till the market was bare, when one could get $2.50 to $3 per bushel, instead of $1 or less in their season.

Mr. Crane alluded to the difference in quality of fruits grown on different soils, which was often quite apparent: and to determine *positively* the effect of ice on the quality the samples should be grown on the same soil, and, if possible, on the same tree and gathered at the same time. He cited an instance of some Bartletts grown on different trees furnished by the late Mr. Reid, of Elizabeth, which, on being tested by that gentleman so astonished him as to make him doubt the variety, the difference was so apparent.

The writer has known instances where the influence of the stock affected the quality of the fruit very perceptibly, and in making tests of this nature, care should be taken to have all the conditions as near alike as possible.

Second Day—Morning Session.

Currants was the first subject this morning.

Mr. Beebe read a brief paper contending that as a *paying* crop, they must receive liberal treatment. As a fancy red Currant, the Cherry heads the list. What it lacked in quantity was made up in size and price. Versaillaise was nearly as large, more productive and less acid—a general favorite. As a field crop Red Dutch, with liberal treatment, would yield more pounds to the acre. White Grape for table use. Black Naples, the standard black variety, has now a rival in Lee's Prolific.

The currant worm and its methods of operation were described and shown by the aid of an admirably executed drawing. The most effective remedy is hellebore. For the comfort of the timid who object to this remedy because it is poisonous, he stated that he had saved 500 bushels last year by using three-quarters of a barrel of shell lime dusted on while the bushes were wet with dew. Salt brine will also kill the worm, and is easily applied, and a good fertilizer. For the borer, cut away the affected portions and burn them. Mr. Crane had a little patch of 1¼ acre, in an apple orchard which had been quite successful, and would have been more so if the trees had all been true Red Dutch, which he purchased them for. But about one-third had proved untrue. He had planted them four by six feet, and manured the ground heavily with hog manure the year before planting—one cannot get the ground too rich. He had found the shade of trees beneficial—made the fruit later. The bushes ought to be renewed every six or seven years. He had not been troubled with worms or borers till two years ago. Old bushes, when taken out should be burned to destroy any insects in them. When the air is still, blow a little hellebore among the bushes—it was effectual in killing the worms which were very apt to be at work before we were aware of it. He regarded Red Dutch as one of the best varieties. It was important to keep the bushes open to let in light and sunshine. The open portion of the orchard did the best in apples; whether this was due to manure, culture, or both, he could not say. He had realized $150 for currants one year and $250 for the apples on the 1¼ acre, being more than he gained from the remainder of the 10 acres in orchard.

The Effects of Tobacco Dust for destroying the worm were asked for.

Mr. Barclay had used it, but not to advantage.

Mr. Hale used stems as a mulch and thought them worth the cost, $15 per ton, for manure.

Mr. Parcell had used the dust or snuff three years successfully. Apply when wet. Two years ago he applied it after a shower, to 150 feet of row; next morning he counted 58 dead worms on a measured square foot of ground.

Mr. Ward thought the worm had been a blessing in disguise, as it had discouraged so many from growing their own supply; they had become purchasers and the prices had advanced so that growers who took the trouble to save their crop, realized better prices for them. Mr. Crane was right as to distances to plant and the importance of attending to the worms in time; then a little hellebore was sufficient; when three or four days older it took more, and they were more difficult to destroy. He thought it best to remove all but four or five suckers to renew the bearing wood.

Mr. Collins used a cart made wide to run between and over the rows for hauling on manure and off turnips, of which he grows large quantities among the bushes. Red Dutch was best for market; White Grape for table—not salable in market, though white made a red jelly.

Mr. Parry regarded Lee's Prolific and Black Naples as alike, or nearly so.

Mr. Lovett had positively seen a vast difference.

Mr. Fuller regarded all the Victorias as identical,—a large, long-bunched, late, red currant. Cherry and Versaillaise he thought one and the same. He and Mr. Downing spent years in investigating the matter and came to this conclusion.

Mr. Roe could see no difference.

The Secretary remarked that the subject was very much muddled, and had been for years. The Cherry or Versaillaise seemed to be more sportive and less fixed in character than any Currant he was acquainted with. He would venture to assert, if Mr. Roe or any one else would select a single plant of either kind, Cherry or Versaillaise, and propagate from it a few years, he would find such a difference in the plants so propagated as to raise grave doubts in the mind of the careful observer as to whether some mistake had not occurred. He had grown the two varieties side by side, when the difference in quality of the fruit was so apparent as to be detected by a stranger.

Mr. Quinn thought all were liable to be mistaken. He had watched these Currants for years, and was satisfied there was a difference, though they were somewhat similar. The especially distinctive characteristics in his grounds were apparent in the habit and form of growth of the plants.

Mr. Barclay grew the Versaillaise very satisfactorily; the only objection was the blank wood; *i. e.*, wood without fruit buds.

Mr. Fuller said that 25 years or more ago there was a true Versaillaise Currant, a smaller fruit than the Cherry, but he did not suppose it was in existence now.

Mr. Parry read a long essay on Experience in Pear Growing, endeavoring to demonstrate that it was a miserable failure as at present conducted, quoting largely from the experience of others in many sections of the country, to prove his assertion. The cause of this disastrous failure was fire blight, but the millenium was about to dawn through a new race of Pears, produced by crossing our best varieties on the Japan and Chinese Sand Pears. This had already been accomplished, and this new departure had produced a vigorous, healthy, hardy, productive, insect and blight-proof race, on which pear growers could hang their hopes. The fruit was large, luscious and handsome, commanding much higher prices in the markets than our best varieties. Among the most promising of these were "Kieffer's Hybrid" and "Le Conte." The first had done remarkably well on his grounds, and was the most valuable Pear yet introduced. It was destined to be among Pears what the Concord was among Grapes. (If we live we shall see.—Rep.)

Mr. Quinn did not take much stock in the gentleman's enthusiasm. If pear-growing was such a failure as he had represented, he and many others only regretted it had not occurred before; but the facts are that Pears were never more plentiful in our markets than they were last fall, and never so low in price. At one time Bartletts could hardly be given away. He was sorry to hear these new varieties were as productive and commanded such high prices. In a few years he and other pear growers would not be able to sell their choice fruit unless they offered chromos as premiums for purchasers. He had grown the Chinese and Japan Pears for years. They were curious and interesting, but the fruit was only fit to cook. For a time they resisted blight, but the last few years they took it badly—last year they were the worst cases on his grounds, and no others within 200 feet. He did not favor dwarf Pears.

Mr. Ward took a brighter and more hopeful view of pear-growing than Mr. Parry had given. He was confining his attention to about a dozen varieties. The Lawrence gave high promise a few years ago, but now it was not so popular. He placed the Bartlett at the head of the list for summer and fall use. It brings more dollars and cents to the pocket than any other. Beurre d'Anjou occupied the same position among the fall and early winter varieties. He had been somewhat discouraged with it a few years ago on account of its not ripening well, but had overcome this difficulty as shown by the pears on the table. Another pear of great value was Dana's Hovey. It was rather small, as was the Seckel, but the quality was unsurpassed. He should plant it largely. He had not lost over 5 per cent. of his trees by blight. Had seen Bartletts average $8@10 per bbl.; but the price had gradually declined. The future profit of pear-growing will be based on the price of apples. If they can be grown as cheaply, why not as profitably? But another point was, what should be done with our large crops that ripen and come in competition with that queen of fruits—the peach? In their natural season the pears on the table would not bring over a dollar a bushel; now they are worth $3 to $4. This subject of keeping pears is an important one, and distributing the crop over a longer period enabled us to realize something like a profit from our labor. He prolonged his sales of Bartletts two months, and could not see that the flavor was injured in the least. He sent loads to market in the fall, that did not pay the expense of carriage; they certainly would not if sent by express. How long could they be kept at a profit? He thought they could and would be kept till April and May, and be in demand, and he hoped another year to keep them till then. It was very important to pick at the proper time, as soon as mature. One of his orchards, about 12 years old, was set 12 feet apart, dwarfs and standards alternating, as he intended eventually to let the standards have all the ground; this had already been done to some extent, the dwarfs not being a success.

Mr. Fuller said that, notwithstanding what had been said against dwarf Pears, in a race of 10 or 15 years for profit, he would take them and win. On being asked if he would risk them on his sandy soil, he replied, yes, on any soil, but he would feed them well. He had never had a case of pear blight or peach yellows on his grounds.

Mr. Caywood also had faith in dwarfs. He had planted 600, and should plant 1,000 more. He always tested the union of bud and stock across his knee; if not perfect, they would break square off. Such trees it was useless to plant. He advised cutting three feet below the appearance of blight. Mr. Idell said the Le Conte hybrid pear mentioned was difficult to find sale for in N. Y. market; it was not as large as represented; it was a second-rate pear, and although Mr. Parry had quoted them as selling at $4.50 per bushel, plenty was sold at half that rate.

Floricultural.

GROWING PLANTS IN LIVING ROOMS.

PETER B. MEAD.

[THROUGH the kindness of the Secretary, Mr. E. Williams, we are enabled to place before our readers the following entertaining and instructive paper which was read before the late meeting of the New Jersey State Horticultural Society.—Eds.]

I am to say something about growing plants in living rooms, which, it was thought, might interest the ladies, who, I understand and am quite willing to believe, constitute the chief adornment of your Society on all occasions, and especially on exhibition days. There is an eminent fitness in this, which many fail to perceive. The fact is, the ladies are an element of strength as well as of beauty in a Horticultural Society; at least, I have always found them to be so. Just think for a moment that where the girls are gathered together, there will the boys be also; but you must be sure to make the boys pay at the gate.

I must say, by way of introduction, that I cannot do more than indicate, and that briefly, the conditions under which plants may be successfully grown in rooms, and furnish a small list of easily grown plants for a beginning. To go over the whole subject in detail would require a volume of no inconsiderable size.

To show you that I have some right to speak on the subject, as well as to win your confidence, I will state that I have grown plants in rooms since I was a boy. In this way I have grown, of species and varieties, several thousands; indeed, I have more than once had upwards of 600 in the house at the same time, nearly every window being ornamented in this way. I may therefore be supposed to know what kinds of plants succeed best in rooms. I will add that I have had no inconsiderable experience in growing plants in the green-house, and I am compelled to admit that to grow a plant well in a room taxes one's knowledge and skill more than to grow the same plant well in a greenhouse. There is, therefore, no occasion for the sneers that we sometimes hear about growing plants in rooms.

Some of you may ask whether plants in rooms are detrimental to health. Speaking from my own experience, I must say they are not. I have even had my bed-room windows crowded with plants during the whole winter. It must be observed, however, that some persons have very delicate and susceptible nervous systems, and cannot endure even the delicate fragrance of the Rose. Such persons may be injured by, or suffer great inconvenience from, fragrant flowers. I have known some such persons, however, to receive much pleasure from the cultivation of inodorless flowers. Aside from such cases, I know of no injury likely to arise from growing plants in rooms; but I know of a great deal of solid comfort and pleasure.

Thus much on the score of injury to the health of the grower. I will turn next to the conditions best adapted to the health of the plants. Since the general use of hot-air furnaces and base-burning stoves, the difficulties of growing plants in rooms have been much increased. In parting with the fire on the hearth and the wood-burning stove, we parted with a good deal of pure, healthy air. But we must make the best of it, and have recourse to ventilation, and open windows and doors in connection with some expedients to be hereafter noted.

In regard to exposure:—a room facing the south is the best; next, east; next, west; and last, north. There are some plants that are very well adapted to either of these exposures, which will be mentioned in their turn. There are some "accessories" which are almost indispensable. A barrel or two of good soil should be put in the cellar, and not left out-of-doors. The best soil for general purposes is rotted sod. A good outfit would consist of rotted sod, leaf mold from the woods, old, well-rotted manure, and sharp sand of any kind, except sea sand. If rotted sod cannot be had, get the best soil you can; for you can make it good enough with the other materials.

Next, something to stand the plants on. Have a box made 3½ feet long, 2½ feet wide, and three or four inches deep, and, if convenient, lined with zinc. Place this on a table, and fill it with clean sand, which should be kept moist. This will promote cleanliness as well as the health of the plants. It will be a great convenience to have the table fitted with rollers, not only for rolling it back on cold nights, but for handling the plants when necessary to change or clean them. There is no necessity for saucers on this sand table; but, if used, they should be inverted, except under Callas and similar water-loving plants. With this arrangement, the plants can be frequently syringed, which not only keeps them healthy and clean, but measurably prevents the accumulation of red spider and some other insect pests. The drip is absorbed by the sand, and no harm is done to the carpet. The moist sand table has another advantage; the evaporation that slowly but constantly takes place from its surface, greatly promotes the health of the plants. Perhaps the ladies will admit that a vaporizer is a good thing to have. The plants think so, and so do I.

I can only allude briefly to the use and composition of soils. Rotted sod, reduced with more or less sand, is well adapted for most kinds of plants. In the absence of rotted sod, a good compost may be made of any common soil, leaf mold, and sand, to which should be added, if convenient, a little well-rotted manure. If you have no manure, then drop in the water occasionally a lump of carbonate of ammonia or a few drops of hartshorn. Do not at any time use guano, either in the soil or in the water. For the Cactus and succulents generally, the soil should be light and sandy.

In regard to watering, do not have any set time for this, but water a plant whenever it needs it, or as soon as the soil gets dry on the surface, and then give it enough to go quite through the ball of earth. Plants like the Calla, however, should be kept constantly wet. A plant in bloom needs more water than when not in bloom; a plant in a dormant condition needs less than when growing; and some plants, when dormant, (Calla and Amaryllis, for example,) require to be kept quite dry. It would take too much time to classify these plants here. A good brass syringe, with duplicate roses, is quite a necessity. A watering pot about nine inches deep, seven inches in diameter, with a spout 2½ feet long, fitted with a couple of roses of different degrees of fineness, is a very convenient thing for a lady to handle. The face of the rose should be flat, and made of copper. One rose should have very fine holes. The common handle is an awkward thing. Instead of being placed on the top, and at right angles with the spout, it should start at the edge nearest the spout, and pass over the top to near the bottom of the pot, in a line with the spout.

In placing the plants in position on the table, do not crowd them. No two plants should touch each other. No matter what your knowledge and skill, or how painstaking you may be, you can not grow good plants if you crowd them; not, at least, what I call good plants. You can not do it even in a greenhouse, much less in a room. It is much more satisfactory to have a few well-grown plants than to have many poorly grown. Place the plants, therefore, in a proper position, and so that each may have a due share of sunshine and light. The spaces between the pots may be very prettily filled in with Selaginellas, Ferns, Festuca glauca, Tradescantia, and similar plants that like a little shade. Syringe or vaporize the plants frequently overhead. Open the windows at top or bottom when the weather is mild. On very cold nights pull down the shade, and roll the table back a little from the window. If you have but little fire-heat, you can, on cold nights, spread some papers or a sheet over the plants. Do not keep the room too warm. In brief, be thoughtful and observant, and these and many other things will naturally suggest themselves.—To be continued.

For Women.

CONDUCTED BY MISS RAY CLARK.

TALK ABOUT MY JEWELS.

BY MARGUERITE.

I SAT down at four o'clock on Sabbath afternoon to review the day. Gertie was quiet for the moment with dolly Rosalind, and Fred was occupied with pencil and paper. We have come through scarlet fever by a long, slow process, and now that whooping cough is prevalent, the children and myself remain at home all the long Sabbath days. The workshops are all closed with the exception of the childrens', and in theirs the sounds or effects of industry, can always be heard or discovered.

About church-time I looked up from my reading to find them both ironing diligently, using the carpet for a table, and a shawl for a blanket. "Why children, this is the Sabbath. It's wrong to iron to-day!" I exclaimed.

"Oh, I know it is," said Gertie, "but we just play that it is *Saturday*."

I had them put the irons away, explained to them why the day was holy, which they appeared to understand readily and then I went out of the room. When I returned, I found them sitting on the carpet with a pint bottle of alcohol beside them, while Fred held a small bottle in his hand in which to measure a dose of medicine for poor Rosalind.

It was lunch time then, and soon after, greatly to my relief, Fred's bed-time. He was tucked in his bed, covered, kissed and all past mischief forgotten by his indulgent parent.

After some time Bessie came in from service and hearing him, supposed his nap was over and went into the room. Instead of sleeping, he had amused himself in several ways, one of the most prominent was, to get out of bed, open a bureau drawer, take out a box of pills and fill his chubby hand with them, and slip in again, and busy himself by sucking the sugar coat off of them, biting some in two, to see if they were as sweet inside as out.

When Bessie entered she exclaimed, "Oh, you dear little fellow you!"

He looked up brightly and asked: "Did 'oo say I'se 'dood boy?" and then added, as he opened his hand, "Oh, des pills are awful nasty, kah! kah!"

Well, he did not sleep. An empty box and a hand with eight pills badly bitten, caused the *pater-familias* to use the substraction table to see how many were missing out of twenty-one. The rest were found in time to save him from an emetic. The nasty taste that troubled him for some time, I judged, was punishment enough, and I sat down complacently to moralize in this way. It will be a life-long lesson to him to keep nasty things out of his mouth—I got no farther. At that moment I was called into the hall. The door connecting us with the store had been left ajar and he had pushed his way through and helped himself to a cigar, and was one moment holding it between his thumb and finger, and the next—oh, horrible sight—putting the proper end in his mouth, at least, I've no doubt but it was! He promised "never, never to 'moke again, if mamma would only kiss him."

Gertie asked me so many times to tie the beads around Rosalind's neck, that I told her I feared it was not right to dress the dolly on Sabbath. She looked perfectly astonished at me, out of her large dark eyes, and asked "You dress me on Sabbath day, don't you?"

The next thing Fred was promenading with my watch in his pocket, and when that was rescued in my favor, he found an old clock to dissect. Just as I had settled down to reading, my jewels were missed. I started in pursuit. They were down stairs, and on my way I passed hammer, irons and nuts. Papa had proposed in the early morning to have some cracked for me, but

"The words of my grandmother rung in my head,"

and I answered, not on Sabbath, but here they were later, and I was fond of them, but just as I picked up the hammer, Gertie exclaimed, "It's wicked, mamma."

"Who said so?" I asked.

"My mamma," but she ought to have answered, my great grand-mamma.

"We are not in mischief now" she told me, while I could see by her expression that she meant to be very good, indeed. In two seconds after I saw that she had a piece of tin-foil in her hand—the second glance I thought it shaped to imitate a revolver, another look and it proved to be Ned's revolver loaded and wrapped in tin-foil. Ah, me! It is only four o'clock! If we all live until to-morrow morning, I'll send to New York by the early mail for a treatise on "Kindergarten Teaching." If Froebel can teach me how to direct these energies in the right channel, I'll not be slow in learning.

LIFE PICTURES.

EVERY human mind, like a great Picture Gallery, is filled with scenes from the past. Dreams of the future occupy it sometimes, but I think we ove best to pause before the pictures of by-gone days. Days that we never before prized, until they had passed beyond recall.

The picture before me now, is of a little house, in the midst of a field. It consisted of two rooms and had a long gallery in front. It was roughly finished and destitute of ornament, scarcely containing furniture necessary for comfort, uncelled, unpainted, unadorned.

Outside, a rough rail fence, without a tree or shrub to lend shade or beauty. The only occupant was a man past the sunny-side of life, accustomed to struggle with life's hardships from early youth.

By chance he met *one* toward whom he was attracted. Chance, destiny or Providence—who can tell which—drew them together and she went to dwell with him, "for better, for worse, for richer or poorer," in the little "Bleak House." Both strong in hope and confidence of being able by the united industry of two pairs of willing hands to defy care and poverty. I wish I could say that success crowned their efforts, but fortune—fickle dame—too often proves unavailing, though pursued ever so steadily.

He did all that two hands could do, and she did her best. While harvests grew and ripened beneath his skillful hands, household duties filled her time, and the little house visibly brightened.

Vines grew over and shaded the sunny windows, and the long gallery was fragrant with the breath of honey-suckle and climbing roses. Trees began to adorn the yard, and in the garden, blue violets peeped from a veil of green leaves. Crimson lilies glowed in the sunshine, roses nodded a welcome, and fruit trees and vegetables yielded a reward to the loving hands that planted and cared for them.

The merry voices of children made music around. The first a boy, with thoughtful, earnest eyes, and afterwards, several little sisters. The children and flowers grow together, and the little ones loved the fairy blossoms that gave grace and beauty to the plain walls. They knew no care, these little ones—and the mother, knowing that life's trials *must* come to them soon enough, strove to make their childhood pleasant, encouraging their happy sports, singing nursery rhymes with them when her own heart was filled with rankling sorrow, striving to beautify and train their young minds.

But trials thickened, sickness weakened and discouraged, losses and misfortunes of various kinds cast a deep gloom over the parents' lives. Finally, the demon debt drove them forth from the home that might have been so happy.

Now, strangers in a strange land, they begin life anew, and only occasionally some chance remark calls up the little house. One day, the mother found a spray of honeysuckle, which she tenderly gathered for the sake of the memories clustering around it.

Her boy perceiving it said, "Mamma, I love honeysuckle, I can't help thinking of the big vine, at the old home." Oh, how much tender regret was conveyed in that little sentence! and how much affectionate remembrance. This proves that the labor we bestow in adorning our homes, is repaid tenfold in the impression it makes upon young hearts. If parents would only spare time from the absorbing cares of life to make home attractive, the young would be less apt to wander and become defiled. Men and women going forth into the world, with hearts kept strong and warm, with loving memories of their homes, would be better enabled to meet life's battles.—Honeysuckle.

GOOD MANNERS.

A PERSON'S manner is quite a different thing from a person's manners. The former indicates very plainly the style and character of the individual, while the latter are the result of training and association. It has been well said, that a lady may possess very excellent manners and yet have a very unfortunate manner, and the reverse. To illustrate: There is a girl who has been carefully taught from her childhood how to enter and leave a room, how to address and introduce people, how to behave at table and in company, yet notwithstanding continual lessons in deportment, she has a manner which is not winning. She is proud, or vain, or cold, or disdainful, and this is shown by her manner even when her manners are agreeable.

We often go into a little store kept by a woman whom we desire to help by our custom. But nearly always her air of supercilious indifference, and her icy remoteness from the least interest in us or our purchases, sends us away half frozen There is an atmosphere of forbiddingness about the shop, and we are glad to get out of it into the sunshine. On the other hand, we know certain saleswomen in some of the great stores of New York, who are so sunny, so genial and so delightful in their way of serving us, that to buy from them is a perfect pleasure, and they often persuade us into taking what we do not really want, solely by the charm of their sweet, unaffected grace.

To have a womanly, dignified and cordial *manner* you must have love to God and your fellow-beings in your heart. To have *good manners* you must use them every day at home, and not keep them merely for company. Fine gold and diamonds never wear out, but are as beautiful after years of use as at first, and far more precious.—Christian at Work.

FASHION NOTES.

HANDSOME new fans are of ostrich feathers to match the costume in color or in pretty contrast.

A novelty in neckties for ladies, is white Japanese crape, edged with lace. They are prettier than muslin or lace scarfs.

The long fleeced fur hats are very fashionable.

Ivory toilet sets, with jeweled monograms and initial letters on the backs of the brushes and hand-glasses, are to be seen.

The serpent bracelet is much worn, many ladies wearing it in place of the linen cuff or lace ruffle. When clasped about the arm it remains stationary.

Seal color grows in popularity as the season advances, and satin is the favorite goods. Dresses, jackets and habits are made of seal satin. In other goods the color is as great a favorite as in satin.

The Queen Ann fashion of trimming merino with figured cotton is carried out in morning and house dresses, by borders of rich figured cretonne stripes, usually seen only on curtains, with veinings and shadings hand-embroidered in silk. The bands are very handsome.

Coiffures are now very simple, both for the day and evening. The hair is worn low on the forehead in short curls or ripples, and arranged in a few loops or a plait at the back of the head.

Tulle is a favorite fabric this winter for ball-dresses, more especially in white, and also occasionally in pale blue, rose color, and other light tints.

Young ladies who are fond of dancing adopt the short dress for balls and evening parties; young matrons generally prefer the more dignified trained skirt.

The brocade fabrics so much in favor this winter will continue quite as much so during spring. Muslin-de-laines and French cashmeres in pretty armure and brocade patterns, will be made up with plain materials for trimmings into very nice walking and indoor costumes.

But the newest and most popular of spring fancy goods is the printed Indian cashmere, in small, multi-colored pine patterns over a light ground.

A COMMENDATORY LETTER.

I WISH to say a few words denoting my appreciation of "Letters from a Country Girl." I concluded, when I read the last chapter, that I would get them all together and read them a second time. I think I usually derive more benefit from a second reading than from the first. I have read the last and twentieth chapter three times, and consider it a perfect gem; just such instruction as most of us need.

If we do not conduct ourselves in a ladylike manner now, it will be our own fault. But then, how prone we are to forget. We seem like children in this respect, we need "line upon line, precept upon precept."

We can bear a great amount of teaching, and then need a little more. It is comforting to painstaking editors that some seeds fall into good honest hearts, and will surely bear more or less fruit. I look upon the "RURAL NEW-YORKER" as disseminating good principles of truth and justice, with freedom from harshness and severity. It is also more benevolent to subscribers than any paper I know of. AUNT FLORA.

Literary Miscellany.

WILFUL'S CHRISTMAS EVE.

CHAPTER II.

(Continued from page 95.)

"My young people would never forgive me for turning you out of a room to which you have an equal, nay, a prior right. I should be scolded to the verge of deafness if I behaved so rudely, shouldn't I, girls?"

Gertie looked down and played with her spoon, but Lelia, who had detected a merry gleam in the brown eyes of Mr. Lee, plucked up courage to say, with a pleading look:

"If these gentlemen possess a forgiving spirit, I'm sure they'll not leave us."

The hint was taken; the young men resumed their seats, and Gertie's fair cheek began to feel less painfully hot whenever she recalled her thoughtless speeches.

No messenger was to be had, though Mr. Lee and his friend volunteered to try and make way to the nearest farm and procure one there. Until the snow ceased it would be madness to attempt it; and though Mrs. Lockwood alternately fretted and scolded Baker for doing the same, Gertie and Lelia prepared to endure their captivity with cheerfulness.

"It's quite a new sensation," the latter asserted. "I shall write a thrilling narrative of our adventures when they are over. What a startling climax it will be if the commissariat stores give out before we are able to evacuate our quarters, and we are not only snowed up, but on the point of starvation!"

"That's too horrible!" cried Gertie. "Let us ring for the hostess, and ask her what she can give us for dinner."

"And we will smoke a cigar in the porch the while," said Mr. Sidney, courteously. "We should be in the way when such an important discussion is in process."

Accompanied by Mr. Lockwood, the young men quitted the room, just as the comely Mrs. Jones entered it, and smoothed her apron, and curtsied the while she replied to the young ladies' questions.

"Eh! well, she wasn't overmuch stocked, seeing she'd only provided for the two gentlemen, but there was a joint in the larder, and some game, and she daresay they would not object to the ladies and their papa's sharing them."

"But why consult them at all? Are not we your guests as well as they?" demanded Lelia, with some hauteur.

"Who will I consult but my employers?" queried the woman, opening her eyes widely.

"But, good gracious! isn't this an inn, free to all travelers?"

Mrs. Jones looked more surprised than before.

"Eh! now what could have put that into your heads, young leddies? This is no inn, but just an old farmhouse that my master and his friends occupy whenever they want a little shooting on the moors."

"And who is your employer? Mr. Lee?"

She shook her head.

"No, it's the other gentleman, Master Robert, I was his nurse when he was a baby. God bless him!"

She was hastily dismissed, and then the girls ruefully surveyed each other.

"This comes of taking things for granted!" cried Lelia. "Here have we been coolly taking possession, giving our orders, and behaving with all the unconcern in the world, while the rightful owner of the place was—was——"

"Laughing at us in his sleeve!" added Gertie. "What an absurd position! We shall have to apologize."

"I hate apologizing; besides, it's not our fault—it's Mrs. Lockwood's."

"Shall we feign ignorance till we can beat a retreat?"

"Do as you like," said Lelia. "I think I shall creep upstairs, and stay there till the snow thaws."

"And desert me? Better put a bold front on it," suggested Gertrude. "It isn't like you to be so cowardly."

Lelia tossed back her head, repeated the word "cowardly!" and Mr. Lee, returning to the room just then for his fuzees, she bravely attacked him. Why had he suffered her and her friends to make themselves so ridiculous?

Mr. Lee pleaded not guilty, and laid the blame on his comrade, who in his turn gravely assured Lelia that if anyone was in fault, it was not he; and by the time Mr. Lockwood had been made to understand the state of affairs, the whole party were so diverted at the bewilderment depicted on his round, rosy face, that their apologies and protestations ended in laughter.

Mrs. Lockwood, who was really suffering from a violent cold, kept her room for several days; but no one appeared to regret it. Her spouse, when freed from the constraint of her presence, was the most genial of men, and the young people soon drifted into intimate relations. They were still held in confinement by the snow; but no one seemed to regret it. The gentleman cleared a space in front of the house, where Gertie and Lelia could walk briskly to and fro, and thus obtain exercise; and when the weather would not permit this, they all gathered in the bay window, where Mr. Lee gave Lelia and Gertie lessons in German, or Robert Sidney assisted the latter in copying a fine old engraving she had found in her chamber. Or the pencil thrown aside and the book closed, they either talked politics with Mr. Lockwood; or the young men, who had traveled, descanted on what they had seen for the amusement of their fair companions.

Then at eve how pleasant it was to gather round the hearth, and chat merrily, conjecture what was going on in the world from which they were so entirely and suddenly cut off! They were never at a loss for amusement; there were old Christmas games played, and new ones invented, no one entering into them more heartily that Mr. Lockwood! and when he asked for the simple ballads he loved to hear, Gertie and Lelia sang all the more sweetly because the rich bass notes of Mr. Lee, and the pleasant, but not powerful, tenor of Robert Sidney, blended with their own voices.

"We seem as if we had known each other for years!" Lelia observed to her friend, as they were going down to breakfast one morning. "What a pity it is that etiquette, in the shape of Mrs. Lockwood, threatens to descend upon us to-day!"

Gertie sighed quite dolefully, and it seemed as if the gentlemen had caught the infection of her gravity, for Robert Sidney walked hastily out of the parlor as they entered it, with signs of agitation on his fine features, and Mr. Lee was equally decomposed.

"Something has happened!" exclaimed Lelia, while Gertie turned pale and looked anxious.

"Nothing that need alarm you," she was assured. "The fact is, Miss Darton, my friend Sidney and I have been taking ourselves to task for a reticence which begins to weigh upon our consciences."

"Pray explain yourselves," murmured Gertrude, entreatingly; while Lelia, though Mr. Lee's tone, rather than what he said, had startled her, after one steady look into his earnest eyes, exclaimed, with her usual impetuosity: "I am sure you have not done anything wrong!"

"Thank you for judging us so kindly, Miss Darton. The case stands thus: My friend was so unfortunate as to overhear you express your repugnance to meet a certain Viscount with whom you were acquainted in your early girlhood. In the face of this avowal he could not bring himself to say I am that unlucky individual. But he agrees with me that this—deception must I call it?—ought not to continue any longer. It will make him very unhappy, he says, if by any act of his own he loses your esteem."

"And I have been domesticated—actually domesticated—for nearly a week, with Viscount Alleyne?" ejaculated Lelia, turning red and then pale. "He is here, and Mrs. Lockwood will have to know it! Oh! this is intolerably provoking!"

She ran out of the room, and Gertie followed, to try and pacify her.

"Dear Lelia, what does it signify? Viscount Alleyne is a man whom no one could help liking."

"He is a hypocrite; he has been tricking me, and I detest him!" was the passionate reply. "And Mr. Lee is worse than the Viscount, for he might have told me the truth; he was in his friend's secrets, and of course he knows that I am to be driven into this marriage, victimized, sacrificed from mercenary motives. I did think *he* was sincere whatever his friend might be."

"Do leave me to myself, Gertie!" she said, presently, and Miss Lockwood was forced to obey. It was no use urging on the angry Lelia that she was really a free agent, and could accept or decline the Viscount's proposals, as she pleased. The girl was writhing under a mortification at which her friend did not guess. Poor Lelia had imbibed such a high opinion of Norman Lee, and had fancied she saw such answering regard in his glances, that she was deeply wounded when she had reason to think that he was not only privy to Lord Alleyne's matrimonial intentions, but that all his praises of his comrade's good qualities were designed to further them.

"But no one shall know what I feel," Lelia told herself. "It shall never be said that I gave my heart away unsought. I will baffle them all before another twenty-four hours have gone over my head."

Mr. Lee espied her presently in the porch, letting the cold air fan her throbbing temples, and hastened to join her.—[To be continued.

ONE HUNDRED YEARS AGO.

ONE hundred years ago wedding tours were not fashionable.

One hundred years ago farmers did not cut their legs off with mowing machines.

One hundred years ago our mothers did not worry over disordered sewing machines.

One hundred years ago there were no disputes about the impoliteness of street-car drivers.

One hundred years ago "crooked" whisky was not known. Our forefathers took theirs straight.

One hundred years ago every young man was not an applicant for a position as a clerk or bookkeeper.

One hundred years ago men did not commit suicide by going up in balloons and coming down without them.

One hundred years ago a young woman did not lose caste by wetting her hands in dish-water or rubbing the skin off her knuckles on a washboard.

One hundred years ago a physician who could not draw every form of disease from the system by tapping a large vein in the arm was not much of a doctor.

One hundred years ago men were not running about over the country with millions of fish eggs to be hatched to order. Fish superintended their own hatching in those days.

One hundred years ago people did not worry about rapid transit and cheap transportation, but threw their grain across the backs of their horses, and uncomplainingly "went to mill."

One hundred years ago every man cut his coat according to his cloth, every man was estimated at his real value, shoddy was not known, nobody had struck "ile," and true merit and honest worth were the only grounds for promotion.—American Republican.

THE EYE-OPENER.

Patent-Electro-Galvanic-Medal battery is the polysyllable title of a little humbug, widely advertised by E M. Ellas, of this city. Legion is the name of the humbugs, and worse, palmed off on the public by gents of that name or alias. This looks mightily like a second edition of the Boyd what-you-may-call-it.... Among those who seek the patronage of the public, especially of the farming part of it, by advertising in the papers or by circulars, we find the following firms not recommended:—N. W. Hunt & J. A. Roarty of Philadelphia; Asa K. Butts, this city; Dr. W. S. Jaques & Co., Cincinnati, Ohio; Kendall & Co., Boston, Mass; N. F. Jones, Ashland, Mass The Northwestern Grain Exchange, and the Chicago Grain and Provision Exchange, despite their high-sounding names, are considered unreliable by the Commercial Reports; C. G. Horton, seller of a spurious Magic Bone Dissolvent. Better keep these names, for if you haven't heard from one or other of them yet, you may. Better keep all the papers .... Another Census swindle is gulling the confiding from Chicago. It calls itself the "Census Information Agency," and pockets the "quarters" of the dupes who want to be enumerators, and send for information, "stamps and blanks."

It being agreed among a party of twelve that a disputed question should be settled by the opinion of the majority, the six ladies expressed themselves opposed to the six gentleman, and claimed the victory. A gentlemen objected to this, as the number of votes were equal, saying, "They are half and half."—"True," replied a witty fair one, "But we are the better halves."

FLAVORING EXTRACTS.

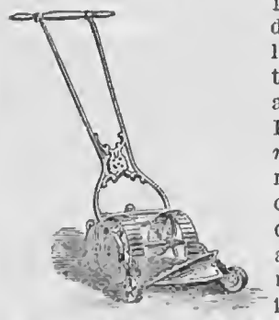
All of these are what are called alcoholic extracts, made by extracting the flavors of the fruits after which they are named. Their manufacture in America is of quite recent date, the first made here being an extract of lemon produced in Boston in 1835. In selecting extracts it is not enough that the article should be pure; it should be made of fruit of excellent quality. Vanilla extract, for example, is of poor quality when made from sour or otherwise impaired Vanilla beans. This, however, is not the chief cause of the poor quality which this extract is frequently found to possess; what is sold under that name is not unfrequently the extract of Tonqua or sunff beans, a much cheaper and inferior article which is, still oftener, used to adulterate the genuine extract. Balsam Peru, rancid, adulterated and otherwise deteriorated oils of lemon, orange, rose, etc., are also used for this purpose. Oils of lemon and orange are sometimes adulterated with the oils of seeds and nuts, and sometimes with spirits of turpentine. Oil of Rose is frequently adulterated with oil of Geranium, etc., and these if not poisonous or injurious are at least inert and fraudulent. Any person of acute perceptions, who is familiar with these substances can easily distinguish and detect them by their flavor and odor. The latter may be the more readily perceived if a small quantity is dropped on blotting paper and the spirit allowed to evaporate. From ten to twenty per cent of water is sometimes added to the flavoring extracts made from oils. A person familiar with proof spirit may judge of its strength by shaking the bottle and observing the bead. Fine flavoring extracts may be kept unimpaired for years, if boxed and in a moderately cool place. Exposure to the air, especially warm air, is always injurious and should be carefully avoided. The extract of Tonqua beans given to dogs in doses of from seven to ten grains, have produced great and fatal depression: and in man, in the dose of from thirty to sixty grains they have caused nausea, giddiness, depression, vomiting and drowsiness. There is also in the market what are commonly known as English Fruit extracts. These are extensively employed for flavoring ices, jellies, lozenges, drops, and for making fruit strups. The most prominent are pineapple, strawberry, raspberry, banana, pear, etc, etc. They are entirely artificial, and are composed mostly of ethers and acids. A very small quantity will sometimes produce nausea and headache, and when taken for any considerable time, or in large quantity, the effect must be highly injurious. They are manufactured on a large scale in England and Germany, and also in Philadelphia. Where the risks of adulteration are so many and serious it is well to know how a pure article can be secured; and so far as our experience extends, the reputation for purity the Burnett extracts have acquired, is well deserved.

OUR PREMIUM OFFERS.

Below we offer two very desirable premiums which will be awarded to any person who may forward us the requisite number of subscribers.

The New Charter-Oak Lawn Mower.

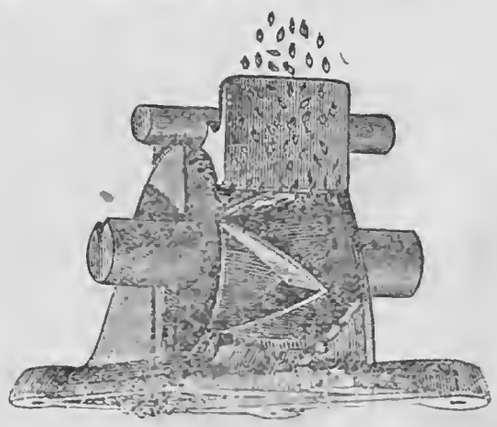
We have selected TWO sizes of this popular mower for premiums. The "standard," or 15-inch cut, (price $25) we shall give for 25 subscribers. and the smaller, 13-inch cut—suitable for small places and for those who do not enjoy pushing a large mower over the turf—we shall present for a club of 16 subscribers. Its price is $16. We have *never* before offered these mowers for such small clubs! and expect every one, including the boys and girls, to have a lawn mower before the season is over. The Charter-Oak is noted for its beautiful finish, and strong construction. It is mounted on large driving wheels, that run *inside* the frame, independently, so that the mower may be turned in small space, and without injuring the sod. Its 5-bladed *solid* knife, works in patent boxes, so made that grass cannot *wind around the shaft*. Hill's Archimedian Lawn Mower Co., makers, Hartford, Conn.



The Farmer's Friend Grain and Fertilizer Drill.

We offer one of these excellent drills *complete*; that is, a nine-hoe, eighteen- drill, with spring hoes, fertilizer and grass-seeder attachments, rear-hoe shifter and land measurer.

The illustration shows the seed-cup and its force-feed principle, which with the patent cone-gearing enables one to sow any kind of grain, in



any condition, with perfect regularity and evenness. We regard this as one of the best drills made, and shall present it for a club of 150 subscribers. (Two or more could profitably combine their efforts and own the drill in common.) Its price at factory, (with all attachments) as offered by us, is $122. Made by the Farmer's Friend M'f'g. Co., Dayton, Ohio.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

GLASS OR TIN FOR CANNING TOMATOES?

MARY WAGER-FISHER.

Last fall, when canning tomatoes, my housekeeper protested against the fruit being put into glass jars, averring that it would not keep. When pressed for a reason, she said that they should be put in something non-translucent—that for herself, tomatoes would never keep more than five or six weeks in glass, and, moreover, that in canning factories tin always was used. "For the sake of transportation," I observed. And I proceeded to have all the tomatoes put in glass cans holding one half gallon each, and using the jar known as the Whitall or Melville patent. I had the jars put in a dark closet, with a dark curtain stretched in front of each shelf. Well, all the jars opened within the last month or six weeks, have proved to contain tomatoes more or less sour, with not a *spoiled* taste, but a taste like vinegar. The tomatoes have every appearance of being good, no fermentation being visible, while the cans are absolutely air-tight. Now, what has produced the acidity of the tomatoes? I don't feel inclined to attribute the fault to glass, as I see no reason in my housekeeper's belief. The closet where the tomatoes are stored is moderately cool, at all times, the thermometer not varying much I judge. Still, it is not a *cold* closet. The fruit was put up after being well cooked, but without seasoning. Will not experienced housekeepers give me the benefit of their experience in regard to tomatoes? Can the acid tomatoes be utilized in making good vinegar?

Concerning Fruit Jars.

While on the subject of fruit cans, I have further remarks to make:—When I first began to put up fruit, beginning with rhubarb and strawberries, I made use of a quantity of glass jars of various patents that were in the closets of the "old homestead," several of which were Mason's "improved." Although some of these jars were comparatively new, yet I found that most of them were suited only for preserves, spiced fruit and the like, as the metal band which screws around the top, had become stretched enough to prevent the can from being made air-tight. I detected the same fault in all cans of similar construction. In purchasing new cans, I was obliged on one or two occasions to have my order filled with Mason's jars, because the dealers kept those of no other make, saying they were the only kind that suited the majority of housekeepers. Among other jars, I used the "Conansey." The fruit in them keeps well; but I foresee the same trouble with them as with the "Mason." My experience and my judgment lead me to reject all cans that are secured at the top by means of a metal band or wire fixture that acts as a screw, for every tight turn upon them stretches them. This can't be helped. I mentioned this fact to dealers who remarked that they had never thought of this before, but added laughingly, "They will last quite long enough, you know." But I did *not* "know." I see no reason why a fruit jar, if not broken, should not last forever, if it is properly constructed, and the only jar so constructed that I have in use, is that which has a glass top, fitting down on a rubber band, and which is made air-tight by means of an iron clamp across the top, through which a screw passes down to the center of the cover. This patent is sometimes called the "Whitall" or "Melville." The moment the fruit is cool in them, they can be readily tested. But after using dozens of them I have never found one imperfectly sealed. So far as I can see, they are the best jar made, and if any housekeeper who reads this disagrees with me, please let her make her objections known, as I now intend to put all my "can" money in these cans. At one shop where I found some, the dealer sold them to me for 25 per cent less than he paid for them. He said he was glad to get rid of them at almost any price. People would have none but the "Mason." I have no desire to enrich the pockets of the maker of this jar by my recommendation, but only to serve the interests of other housewives who, like myself, wish to use their money in the way that will prove most economical and most satisfactory.

INFANTS' CLOTHING.

MRS. W. V. A.

I was greatly interested in the articles by "E. E. K.," and "Marguerite," and would like to say something on the same subject. Last spring and summer I was busy preparing a wardrobe for an infant, and of course, I studied the *comfort* rather than the style of the little garments. In the first place, I objected to flannel garments next to a baby's skin, as I considered them irritating and weakening. Secondly, it appeared absurd to me to put little linen shirts on one half of a child's body and flannel on the other. Thirdly, I did not think it was quite the right thing to put so much clothing on a child's chest and body and let its little arms and the upper part of its chest go so thinly clad. Reading an article by Mrs. Katie Jackson, in the "Laws of Life," I got the idea of what I wanted; high-necked and long-sleeved waists with buttons to button it's skirts on, seemed just what I wanted. I made them of white muslin—waists and skirts—and others of flannel, to be worn over the muslin ones and next to the dress.

My plan worked admirably until cool and finally cold weather came, and then I found that the muslin garments were not warm enough. My mother suggested canton-flannel, which I got, and made up into little gowns or "slips" that come well below her feet. The first ones were made of fine and rather thin canton-flannel, but those she is now wearing are made of a heavier quality, and when she is dressed in one of these with a flannel waist made with long sleeves and high-necked and a flannel skirt buttoned on, and over these a little "yoke" or "gabriel" white dress, I think she is as comfortably and hygienically dressed as any baby in the land. Thus, I think I have secured my objects, a suitable and uniform covering, and hence an equable temperature of all parts of the body.

COOKING FOR THE SICK.

The flesh of young animals, although the tenderest is less digestible than that of animals of middle age. Mutton is easier to digest than beef. *Raw* oysters are nutritious and easily digested. Eggs should not be cooked until the whites harden—neither should they boil, but pour boiling water over them, cover and let stand from five to ten minutes. Food should be served in the very daintiest manner. A cup of tea freshly made and served with one or two blocks of sugar, and a few drops of cream with a slice of toast, even, yellow and without crust, delicately buttered and fresh from the fire, a bit of tender steak, broiled either rare or well-done to suit the patient, and a *fresh* roasted potato, will, if served upon whole dishes and clean linen, tempt the most capricious appetite.

Beef Tea.

Cut the meat of a rump-steak into dice, and to a pound of meat allow a pint of *cold* water, add a little salt and with a fork squeeze the pieces in every direction to extract the juice. Next put water and meat into a *perfectly* clean saucepan; cover and place on the back of the stove where it will gradually heat, taking care that it does not boil. Continue this from two to three hours, then bring to the boiling point strain, pressing the meat with a spoon. Remove any fat that may arise and add a little more seasoning. Sick persons soon tire of beef tea, refusing to take it. When this is the case, add a very little sherry and allow it to get cold. If properly made it will be a jelly, and patients will take it in this form when they would not in the liquid state. Young children will sometimes relish the tea better if it be sweetened instead of salted.

DOMESTIC RECIPES.

Caudle.

Mix two tablespoonsful of oatmeal in a little cold water and then stir into it a pint of boiling water. Add a few raisins and boil very slowly for an hour. Sweeten and grate in a little nutmeg. A small quantity of wine brandy is sometimes added.

White Wine Whey.

Slightly sweeten half a pint of new milk, turn into a clean saucepan and bring to a boil. At once pour in a small wine-glass of white wine. Let it boil up again and set on the side of the stove until the curd forms one lump. Pour off free from the curd.

Beef Juice.

Cut lean steak into pieces three or four inches square, score with a sharp knife on either side, broil for a minute, then express the juice in a lemon squeezer. Add a pinch of salt and give either ice-cold or hot.

Fever Drink.

Toast the bread carefully through and through, then pour boiling water on it and, if liked. add a small piece of lemon peel. Drain off carefully that no crumbs remain in the fluid after it has got cold.

Pour cold water on wheat bran, let boil half an hour, strain, add a little sugar and lemon juice. MRS. M. G. L.

Fried Parsnips.

Scrape, wash, boil and mash. When cool enough to handle season with salt and pepper, flour the hands and make into little cakes. Roll in flour and fry in boiling fat. Drain and serve very hot.

Lemon Juice

The juice of six lemons and the grated peel of two, two coffee-cupsful of granulated sugar, a package of Coxe's gelatine, one quart of boiling water. Soak the gelatine in little more than a cup of cold water for an hour, then add the sugar, juice and peel, and let stand another hour. Pour over the hot water and stir until the gelatine is all dissolved. Strain through a flannel bag. Pour into a wet mold and set in a cool place. Make the day before it is wanted.

Fried Onions.

Peel, wash and cut crossways so as to form undivided rings. Flour them and fry in beef drippings for five or six minutes. Drain, sprinkle with salt and pepper and serve with steak.

Boiled Salt Mackerel.

When freshened wrap in a clean cloth and *simmer* fifteen minutes. Take carefully out of the cloth and place on a flat dish. Boil two eggs until hard, cut into pieces, arrange around or on top of the fish and pour drawn butter over all. E. L. M.

Sausage.

In my judgment the following recipe for sausage is hard to beat:—To 40 pounds of meat use 12 ounces of salt, eight ounces of sugar, two ounces each of sage, black pepper, cinnamon, cloves and ginger. It will require about three quarts of water to be added to make it mix readily. NELSON RITTER.

Apple Snow.

Make a boiled custard of two-thirds of a quart of milk, with the yelks of four eggs the whites of two, and half a cup of powdered sugar. Beat the remaining whites to a stiff froth, add a half cup of powdered sugar, and grate into it five large, tart apples, stirring in as you grate, that the coating of egg and sugar may prevent the apple from changing color. Into a deep dish pour the cold custard, and heap the apple meringue on top. To be eaten soon after making. MRS. B.

QUESTIONS AMSWERED.

Fly Stains. Cleaning Zinc.

What will remove fly stains from paint without scouring; also, what will clean zinc and restore its new look? MRS. A. B.

Ans.—1, Add a few drops of ammonia to warm soap-suds, and rub with a woolen cloth. Try a tablespoonful of ammonia to half a pailful of water. 2, Mix glycerine with a little dilute sulphuric acid, and apply.

News of the Week.

MISCELLANEOUS.

Monday, February 9, 1880.

The New York Herald has headed a subscription list to relieve the famishing people in Ireland with $100,000 ...In Washington, on February 2d, a draft of a bill to reorganize the Department of Agriculture was submitted to the full House Committee on Agriculture last week by the Sub-Committee. The Sub-Committee was instructed to perfect this bill and report it to the Committee next Wednesday. This bill will recommend an enlargement of the powers of the department. A majority of the Committee are in favor of making the Commissioner of Agriculture a full-fledged Cabinet officer, with the same salary and emoluments as other members of the Cabinet. A provision to accomplish this object will be inserted in the bill now being prepared by the Sub-Committee. Mr. Covert, Chairman of the Committee, will make a minority report to the House, recommending the abolition of the Department of Agriculture. He will also oppose any attempt to make Mr. Le Duc a Cabinet officer. Mr. Covert does not believe that it is the province of the general Government to run a Department of Agriculture any more than to create a department of mining, a department of stock raising, shoemaking, or any of the other industries of the several States.....Utes attacked a supply train carrying ammunition and rations to Major Morrow in New Mexico the other day, but they were beaten off by Capt. Carroll and 60 soldiers and scouts in charge, one Navajo scout being killed and two soldiers wounded. According to latest accounts Major Morrow was closely pressing Victoria and his band of Apaches, and other troops were heading off the savages.... Preparations are under way for a new American Arctic expedition under the direction of Dr. Emil Bessels, late chief of the scientific staff of the Polaris. It is to be fitted out by private enterprise, and will sail for the North next year via Jones's sound, where Dr. Bessels intends to establish a meteorological station, to co-operate with those of the international congress. At this station a yacht will be kept to maintain communication, while the principal ship of the expedition, a powerful steamer, will explore the unknown regions to the northward and westward....There is great excitement in Denver, Colorado, over a new discovery of gold near the mouth of the canon of the Platte, a mile from the South Park railroad, and only 20 miles west of Denver. A vein of mineral ores was struck in the Dolly Varden mine at a depth of 20 feet last Friday, and specimens assayed give the value of the ore at $21,199 per ton, $20,176 of it being gold.

The third trial of Mrs. Smith and "Cove" Bennett for the murder of the former's husband, a Jersey City policeman, has resulted in their acquittal.... The politicians all over the country are laying out no end of work over conventions big and little; but they ought to bear in mind that, while it takes a great many conventions to nominate a man for the presidency, it only takes one election to defeat him. A poll of the republican side of the House at Washington gave Blaine 42, Sherman 10, Washburne 4 and 11 blank, with a large number of absentees.....The democratic national committee meet at Washington February 23 to decide when the next national convention shall be held.....It has been Secretary Sherman's ambition to reduce the public debt below $2,000,000,000 while he was at the head of the treasury. Last week he came within $784,000 of bringing it down to that point, and this month's statement will no doubt see the debt, less cash in the treasury, below $2,000,000,000.

FOREIGN.

The Irish famine is growing apace. While the people are starving in thousands there's a world of wrangling about the uses of the funds contributed for their relief. This Parnell agitator in this country seems to be the chief cause of the trouble, and will probably cause more injury than benefit to the distressed population The chief fund hitherto raised is that of the Duchess of Marlborough, wife of the Viceroy of Ireland, amounting to more than $200,000. Parnell charges that only those who pay rent and truckle to the landlords are relieved from this source. This assertion is emphatically contradicted by the Duchess and a host of others, among them some of the Irish Roman Catholic Bishops. On the other hand Parnell and his crowd are charged with refusing to relieve rent-paying tenants from the proceeds of the contributions he is gathering here. The Herald fund will probably soon be the largest, and will certainly be the best administered

In Silesia, also the famine is exceedingly severe, and the efforts among the German-speaking people to relieve it are second only to those of the English-speaking people to mitigate the distress in Ireland. Italy, too, especially the Southern provinces, is hard pinched. Indeed, were it not for the supply of food of all kinds which America is pouring into Europe, our trans-atlantic friends would, most of them, be in a famishing condition. War preparations and war surmises are still the order of the day among the curious public, while occasional assurances that everything is delightfully peaceful, coming from the rulers, have little effect on the minds of the masses.

The London Standard's Vienna correspondent says; "Parnell's reception at Washington is regarded here as a mere comedy."....The London Standard's St Petersburg dispatch says the Government is about to start a journal to combat the Nihilists. ....The Times's Berlin dispatch says the Ultramontanes in the Bavarian Chambers have resolved to appeal to the King, imploring him not to consent to the augmentation of the army....The cession to England of a strip of the African Gold Coast, as a measure of prevention of the smuggling of spirits by American traders, was officially announced in the House of Commons Friday. It was also confirmed that correspondence between the Ameer of Afghanistan and the Russian Government had been discovered in Cabul....The exciting parliamentary election in Liverpool resulted Friday in the return of the Conservative candidate, Mr. Edward Whitley, by a vote of 26,106 to 23,885 for Lord Ramsay, the Liberal candidate, who had made a bid for the home-rule vote pledging his support to an inquiry into the question of home-rule.

AGRICULTURAL NEWS.

La., estimates this year's sugar crop at 175,000 hogsheads of a finer quality than usual....The total home clip of wool last year amounted to 232,500,000 pounds....The S. C. Board of Agriculture has just employed a permanent chemist that analyses of commercial fertilizers may always be obtained....S. C. charges a privilege tax of 25c, on every ton of fertilizer sold or offered for sale in that State....In Denmark wheat occupies 5 per cent. of the whole cultivated area....Russian wheat from the Baltic has to be mixed with German or Danish wheat to fit it for the English market.....The total amount of estate sales reported at the Mart, London, Eng. for the year 1879 was £7,693,764. The corresponding figures for the three preceding years were :—1876, £10,495,927, 1877, £11,738,882; 1878, £9,839,897....Dr. Glen of Cal. is said to have had 45,000 acres in wheat last year—yield 800,000 bushels....By the late reduction of tax on tobacco the government loses $1,000,000 yearly; the grower gets no more for his crop; the consumer pays as much for his "weed," but the middleman laughs....The dairy business in Cal. is largely in the hands of the Swiss who practice soiling almost exclusively....Europe produced 611,000 cwts of hops last year, and America 155,006 cwts....There's a "boom" just now on the Norman-Percheron horse....The American Agr. Ass. is going to issue a semi-annual periodical.... The Maine beet sugar factory is said to have used 9,000 tons of beets in '79, and made 1,440 000 of sugar, which sold for 8½c. per pound....A beet sugar factory is to be started at Franklin, Mass., with a German Superintendent and a capacity of 150 tons daily....Delaware peach growers got $1,500,000 for their 3,981,235 baskets of peaches last year....Five cotton factories near Petersburg, Va., give work to 715 operatives and used, in '79, 9,000 bales of cotton....500 wagons loaded with tobacco came into Lancaster, Pa., one day last week....The largest sugar mill in the world will soon be erected in St. Charles parish La.,—weight of mill and engines, 300,000 pounds.... Owing to the advance in prices of iron and wages, the National Association of Stove Manufacturers on last Thursday raised the wholesale price of stoves to 6½ cents per pound, with extra for trimmings, etc.—they all do it.....The regular ticket nominated for 1880-'81, by the present board of managers of the International Dairy Fair Association, is:—for President, Hon. Hiram Smith, Sheboygan Falls, Wis.; for Vice-President, Col. R. P. McGlincy, Elgin, Ill.; for Treasurer, W. W. Dexter, Chicago, Ill.; for Secretary, Col. R. M. Littler, Davenport, Iowa....At wholesale the best Carolina rice is selling at 7¼ to 7¾ cents per pound, while East Indian rice commands but 6 to 6¼ cents per pound....After the mills now being constructed are completed, Minneapolis, Minn., can turn out 16,000 barrels of flour per day....A Quebec merchant has experimented successfully in shipping beef to England in the carcass. The animals are beheaded, the entrails are taken out, and the bodies pressed into a small compass and frozen. The hide is not removed until the voyage is over, and it is claimed that the meat is superior in appearance to other imported beef, and keeps longer ....A London paper, in tracing the mode in which 122 of the titled families of England have acquired lands, states that scarcely a dozen of the number got them by professional or commercial pursuits. The writer asserts that not one-tenth of the 5,500,000 acres possessed by the 122 was acquired for value received. They were gifts of crownlands. ..David Dows, the great N. Y, capitalist and grain speculator, is said to have 45 out men buying corn up in Ia., for an expected rise before next harvest: In some parts of Ia., corn has sold for 15c. per bush. ....The N. J. Game Society are arranging to let loose a large number of quail in different parts of the State next spring and call on the people to see that the game laws are rigidly enforced....The Farmers' Mutual Insurance Company, of Kalamazoo, Mich., has a list of 2,592 members, paid out $11,486 85 (of which $9,229 52 were for losses), and has $384.50 remaining in the treasury. Assessments on members during the year were $8,516.94. . The Canadian Dairy Association will hold its annual convention at London, Ont., Feb. 18-20. . The ninth annual convention of the N. Y. State Dairymen's Association and Board will be held at Utica Feb. 10-11. . . The creameries in Iowa are paying $1 10 to $1.20 per one hundred pounds for milk this winter. That is more than 50 per cent. higher than that paid in the summer....Several farmers in Kentucky are working their Shorthorn cows. They do as much plowing as horses, and feed better for the exercise they have. . . At the recent annual meeting of the N. Y. State Grange the following officers were elected for the next two years:—Master, W. A. Armstrong of Chemung; Overseer. Guy Shaw of Yates; Lecturer, Prof. W. B. Lazenby of Tompkins; Steward, General E. F. Jones of Broom; Assistant Steward, W. C. Gifford of Chautauqua; Treasurer, J. A. Varney, of Erie; Secretary, H H. Goff. of Monroe; Gate-keeper, Allen Potter of Cortland; Ceres. Mrs. H. Stone of Oswego; Pomona, Mrs. Elliot Makepeace of Jefferson; Lady assistant Mrs Hungerford of Tompkins; Executive committee, L. H. Bishop (chairman) of Jefferson; F. F. Capeu of Monroe, (Secretary;) S. O. Potts of Columbia; W. A. Armstrong of Chemung; H. H. Goff of Monroe. At the late annual meeting of the Nebraska State Board of Agriculture, the following officers were elected for 1880:—President, Martin Dunham; Omaha; 1st Vice-president, J. T. Clarkson, Schuyler; 2d. Vice-president, J. B. Dinsmore, Sutton; Treasurer, C. Omaha; Secretary, D. H. Wheeler, Plattsmouth; Managers, J. F. Kinney, chairman; E. McEntyre, R. Daniels, G W. E. Dorsey and E. N. Grenell. Competitors for Arbor-Day premiums must do the planting on the third Wednesday in April next....Illinois is to go into cheese heavily next season, and Iowa exclusively—well, nearly so—into butter making.... The Department of Agriculture has bought 10,000 pounds of Early Amber cane from one Minnesota farmer for $1,000....Abundant rains in California have enabled farmers to plant 3,000,000 acres of fall wheat—a thing that has never happened before....A bill before the Iowa Legislature prohibits the sale of diseased swine....The average wheat yield per acre in the United States in '79 was 13 9-10 bushels....Maine farmers have an idea that sugar manufacturers and refiners are pocketing an unfair share of the proceeds from sugar beets.... The negro exodus is beginning to be very disagreeably felt by planters who can't get enough laborers in several parts of the South....Great Britain has 175,000 acres in orchards—10,000 more acres than last year.... Lamartine, Mich., is encouraging the cultivation of Early Amber sugar cane... South Carolina basket Willow is said to be equal to the best imported....A sugar beet factory is to be started in Oswego County, N. Y.; 25 men will raise from 1 to 16 acres of beets next season for it —not nearly enough to make it pay....A sugar beet convention will be held at Elmira, N.Y., April 18. Experts will tell all about the industry ... There are 20 schools of forestry in France....Farmers about Amherst, Massachusetts, led by Levi Stockbridge, are urging that the State pay a bounty of a penny a pound on all beet sugar made for a term of years....Norfolk, Va., is to have a cotton factory....The Committee on Agriculture of the Massachusetts Legislature recommend the adoption of a memorial to Congress providing for legislation to prevent the spread of pleuro-pneumonia. ..The A. A. A. is begging for annual memberships for $1 and life memberships for $50. Cattle hoofs are worth $50 per ton for *horn* buttons.. In France 18,000,000, it is estimated, live by agriculture, 9,000,000 by manufacture....In '79 France produced only 565,400,000 gallons of wine—506,000,000 gallons less than in '78, and 660,000,000 gallons less than the average for the ten preceding years....The next N. Y. State fair will probably be held in Albany, the owners of the fair grounds there being less hoggish than those at Rochester....A resolution is before Congress for the appointment of a Commission to investigate the cotton worm, its ravages, and the most effectual means of exterminating it. .... Very successful annual State Grange meetings have lately been held at Milwaukee, Wis., and Bloomington, Ill. Membership said to be increasing....It is said the National Grange is about to make a combined attack on high railrord freight charges, and memoralize Congress for legislation against them. An effort is to be made to secure, say 4,000,000 agricultural votes to the party that promises the most before the next general election. . . The steamer Strathleven with an experimental cargo of fresh meat, 60 steers and several hundred sheep from Australia to London, arrived in the Thames last Tuesday. Meats in good condition. . ....In the past seven years 4,000 stallions and 14,000 brood mares have been shipped from England to Germany and Austria—a good evidence of the high opinion entertained there of British thoroughbred horses....In order to meet the anticipated increased demand of our cattle trade, it is said that upwards of 70 (!!) steamers are now being built in Great Britain expressly to meet the requirements of this interest....Messrs Smith and Powell, of Syracuse N. Y. lately shipped 19 Holsteins to Texas.....

Our Progress.

As stages and stage-routes are quickly abandoned with the completion of railroads, so the huge, drastic, carthartic pills, composed of crude and bulky medicines, are quickly abandoned with the introduction of Dr. Pierce's Pleasant Purgative Pellets, which are sugar-coated, and a little larger than mustard seeds, but composed of highly concentrated vegetable extracts and are warranted to cure all irregularities of stomach, liver and bowels. Sold by druggists.

THOSE COMPLAINING of Sore Throat, hoarseness or "taking cold," should use "*Brown's Bronchial Troches*." The effect is extraordinary, particularly when used by singers and speakers for clearing the voice.

Why be sick and ailing when Hop Bitters will surely cure you?

The Markets.

THE GIST OF THE MARKETS.

For once the comparison of prices between this week and last is omitted, but we would advise all interested in the matter to make the comparison themselves. It is an interesting way of passing time, and (pursued for a few months) would be highly instructive.

Next week we shall begin to quote prices of fertilizers, as the season for these is now at hand.

The Mark Lane Express, in its review of the British grain trade, says: "All out-door work is again stopped by frost. Thrashing occupies the attention of farmers, and home-grown wheat is consequently more liberally offered. In some districts, notably Yorkshire, fears are expressed that recently-sown wheat has been frosted, or, from some other cause, is deficient in vitality. Many of the early-sown fields elsewhere, however, are looking well. Some improvement is noticeable in the condition of the home-grown wheat offered at the country markets, but all, except the choicest lots, have been neglected. The imports of foreign wheat into London have been moderate, and American especially small. Business has been quiet, and the week's demand was of an ordinary consumptive character, principally for descriptions of foreign wheat available as a substitute for English. According to a moderate computation, it is estimated that the requirements of Great Britain and France will reach 12,000,000 quarters between this and August, exclusive of the quantity now afloat. Notwithstanding this, trade continues discouraging to holders. As a consequence of liberal stocks to select from, and the bad demand for flour, millers have shown no desire to do more than meet present requirements. It seems scarcely likely that any marked rise can be expected before May or June. Under any circumstances, it will be necessary for the American 'ring' to hold over stocks some time longer. The arrivals at ports of call have been small. The demand for wheat has been quiet and somewhat irregular at a decline of 1s. and 2s. per quarter. Maize, notwithstanding its scarcity, receded 6d. per quarter. Wheat for shipment was very inactive, though offered at 1s. and 2s per quarter less. Maize was slow at a decline of 6d. The sales of English wheat last week were 36,903 quarters 45s, 7d. per quarter, against 54,792 quarters at 39s. 1d. per quarter for the corresponding week last year. The imports into the United Kingdom during the week ending January 17, were 593,455 cwt. of wheat and 228,510 cwt. of flour."

Baring Bros. circular of Jan 23 says: Wheat market continues dull. Sales—California October bill of lading per wooden ship at 9s. 9d; Oregon prompt iron ship at 55s. t. q per 500 pounds. California terms. Calcutta new No 2 club January, February shipment via Canal, at 51s, 3d s. d. per 402 pounds. The average price of English wheat for the week ending January 17 was 45s. 4½d. on 32 871 qrs. returned. Maize steadier at 26s. 2d for mixed American. COTTON—East India fairly steady, with a moderate demand, but American future close 3-16d. per pound lower. Sales for the week, 2,320 bales spot (of which 350 Tinnivelly at 6¼d@6 5-16d; 620 western at 5 1-14d@5 15-16d; 1,200 Bengal at 5¼d@5¾d.) and about 20,000 to arrive, and for forward delivery. Liverpool, sales 53,640 bales. Middling Orleans at 7⅛d; middling upland at 7d. per pound.

SPCIALS FROM ALL CENTERS.

Until Saturday, Feb. 7.

Baltimore.—WHEAT Southern red at $1 35@$1 40; do. amber at $1.45@1 50; No 2 western winter red $1 44¾. CORN Southern white at at 58@61c; do yellow at 58c; western mixed, spot and February, 57¾@57½c; March at 56¾@56¾c; April, 52¾@52¾c. May at 52¼@52¾c; steamer at 55c. OATS easier; southern at 47@48c; do. mixed at 43@47c; Pennsylvania, 47@48c. RYE quiet at 90@92c. HAY prime to choice Penn. and Md. $17@15. BUTTER steady; prime to choice western packed at 20@26c; roll, 18@22c. EGGS firm at 15@16c.

APPLES at $1 50@2 75 ₮ bbl., according to quality. CRANBERRIES at $6@8 50 ₮ bbl. SEEDS—We quote Clover Seed as quiet at 8½@9¼c ₮ lb for Western and New York; Timothy at $3@3 10 ₮ bushel; Red Top at $2 70@2 90 ₮ bag; Canary Seed at $2 45@$2 85, and American Linseed $1 50@1 55 ₮ bushel; Calcutta $2 37@2 40.

Chicago—WHEAT unsettled No. 2 Chicago spring $1 21 cash; $1 21@$1 21⅞ March; $1 22¾ April; No 3 do. at $1 06; rejected at 90c. CORN unsettled at 35 1-2c. cash; 35⅞c. March; 40 1-2c bid May. OATS dull, at 31⅝@31⅞c. cash and February; 32c. April; 36½c. May. RYE steady at 76 1-2c. BARLEY dull at 82c. DRESSED HOGS weak at $4 80@4 90. Pork active but lower at $11 60c. cash; $11 70c. March; $11 87 1-2c April. LARD in fair demand, but lower at 7c. cash; 7 07 1-2@7 10c. March; 7 17 1-2@7 20c. April. Bulk meats quiet and weak; shoulders at 4 10c; short rib at 6 45c; short clear at 6 50c. EGGS. Fruit house at 8@10c; fresh at 14c. POTATOES. Car-lots quoted at 50@56c. and store lots at 55@65c. The sales are to the city trade. POULTRY. Chickens, dressed, 6@7c per pound; turkeys, dressed, 9@10c. per pound; ducks, dressed, 7@9c. per pound; geese, dressed, 6@8c. per pound. SEEDS Timothy active and firm, selling at $2 65@2 75, prime closing at $2 70@2 75. The offering only fair. Clover also stronger, being in better request with rather small offerings of fresh lots Sales reported at $4 70@4 85. Flax at $1 62@1 63. BUTTER—There is a fairly firm feeling among holders of choice packed butter, but for anything not answering to that description the market continues weak, the supply of low and medium grades considerably exceeding the demand. Creamery 27@32c; good to choice dairy 22@26c; medium 18@20c; inferior to common 10@16c; Roll 15@20c. CHEESE—A firm tone pervades the market, both for full cream and skim cheese. Dealers report a continued good demand at the following range of prices; full cream 14½@15c; part skim 12½@13c; low

grades 8@10c. Hog market quiet and easier, mixed packing at $4 30@4 40; light at $4 35@4 40; choice heavy at $4 45@4 65; market closed steady, with, most all sold. CATTLE quiet and weak; shipping at $4@4 90; butchers' at $2@3; Nebraska Texans at $3 90@4 10; stockers and feeders weak; common at $2 60@3 25; good at $3 50@4 20; yards cleared of stock. SHEEP market quiet but steady at $3 50@4 70.

Cincinnati.—FLOUR dull; family at $5 80@6 10; fancy at $6 25@6 75. WHEAT dull at $1 26. CORN dull at 39c. OATS steady at 29c. RYE in fair demand at 85c. BARLEY quiet at 87c. PORK dull and nominal at $12 25@$12 50. LARD dull at $7 10. Bulk meats quiet; shoulders at 4.24c; clear ribs, 6.50c; clear sides at 6.70c. BACON steady; shoulders at 5½c.; clear ribs at 7¼c; clear sides at 7½c. Green meats dull and nominal; shoulders at 4c.; sides at 6c.; hams at 7c. BUTTER quiet and unchanged. HOGS steady; common at $3 25@$4 25; light at $4 25@$4 45; packing at $4 25@$4 50; butchers at $4 50@$4 55.

Detroit.—WHEAT easier; extra white Michigan nominal; No. 1 do., $1 26½; February, $1 26¼; March at $1 23½; April at $1 31¼; May at $1 42; milling No. 1 nominal. CORN quiet; No 1 yellow, new at 47c.; high mixed at 45c. OATS firm; No. 1 white at 42½c.; No. 2 white at 40c.; No 3 mixed at 39c. CLOVER seed dull; prime at $4 65. Dressed hogs at $4 80@$4 85.

Indianapolis.—WHEAT firm; No. 2 red at $1 25@$1 26. CORN weak at 35½@36c. OATS steady at 36@38c. HOGS steady at $4@4 50.

Louisville.—FLOUR dull and unchanged. WHEAT dull at $1 27. CORN quiet, white at 45½c.; mixed at 42c. OATS dull; white at 40c.; mixed at 39c. RYE dull at 84c. PORK quiet at $13. LARD steady; choice leaf in tierce at 8½c.; do. keg at 8 3-4c. BULK MEATS quiet; shoulders at 4¼c; clear ribs at 6 70c.; clear sides at 6 95c. BACON quiet; shoulders, 5c; clear ribs at 7¼c; clear sides, 7½c. Sugar-cured hams, 9½@10½c. MILL OFFAL.—We quote per ton in bulk: Bran, $12 50@13 50; shipstuff, $15; middlings, $18 50. HAY.—Demand fair. We quote prime to choice timothy $16@$18, and mixed at $12@$16 per ton on arrival. FIELD SEED.—Active and prices rule steady. We quote, delivered from store: Timothy, $3; orchard grass, $1 70; red top, 75c.; clover, common red at $5, and sappling at $5 25; bluegrass, clean, 55c.; extra clean, 65c. STRAW—$5@$9 on arrival and $10 from store. VEGETABLES.—Potatoes have been active, with choice early rose firmer, and ordinary home stock rather easy. We quote on arrival: Onions for home-grown and Northern, $4@$5 per bbl., as to quality. Russetts, peachblows and peerless potatoes, from store, in cooperage, at $1 75@1 85; early rose, $2 10@$2 25 per bbl. New Southern cabbage, $2 50@3. POULTRY—Chickens, $2 60@$3 per dozen, as to size, for large, and $2@$25 for small.

Philadelphia.—WHEAT decidedly better feeling; rather more inquiry for milling as well as for futures, and prices advanced ½@1½c. since yesterday; western Pennsylvania red on track at $1 44; Southern amber choice at $1 46; No. 2 red in elevator, in car lots at $1 41. CORN in good demand from local consumers, and prices are well maintained, but for export and futures there is very little disposition to operate; prices of the latter fell off ¼@1c. Pennsylvania and Southern sail yellow on track and in grain depot at 58c; western mixed on track 57c.; do in elevator 56c.; Southern white on track at 61c. OATS in good demand; prices rather better; rejected at 45½c.; No. 2 white, 47 1-2@48c.; No. 3 do. at 47c. City mess beef, 13. Beef hams at $16 50@$17. Mess pork at $12@$13 25; extra prime at $10@$10 12 1-2. Smoked hams at 10@11c.; do. in salt and pickle at 8 1-2@9c.; clear rib sides, smoked at 7¾c.; do. in salt, 7c.; shoulders in salt, 4 1-2@4¾c.; do. sugar-pickled at 5@5 1-2c.; do. smoked, 5 1-2c. DRESSED hogs at 5¾@6c. LARD—Western tierces at 7 50@7.87 1-2c.; do butchers', 7¾c. BUTTER firm; creamery extra at 32@34c; Bradford county and New York extra at 25@26c; Western Reserve extra, 23@25c; do. good to choice at 17@22c; rolls steady for choice; Pennsylvania extras at 16@20c; Western Reserve extras at 18@21c. EGGS steady, Pennsylvania at 15c.; Western at 17c. CHEESE firm; New York factory at 14 1-2@15c.; Western full cream at 14 1-2@14¾c.; do. good at 13¾@14c; do. half skims at 12 1-2@13c. HAY AND STRAW are dull and weak, under a full supply. We quote cut hay at $19 and 19.50; prime baled do. at $18 and 18.50. Rye Straw at $19 50 and 20.50; wheat do. at $12, and oat do. at $13 per ton. SEEDS.—Clover was taken only in small lots at prices ranging from 7 1-2c. to 9 1-2c. for ordinary to prime. We note sales of 30 bags prime at the outside rate. Timothy was in light supply and firm at $3.25 for prime. Flax was scarce and wanted at $1 65. VEGETABLES.—Potatoes are momentarily in small supply, and are meeting with a good demand at better prices. We quote choice Rose at 53c.; fair to good do. at 45 and 48c.; Snowflakes at 55c.; Peachblows at 50 and 55c. for red and white, and Peerless at 43 and 47c., as to quality. Onions are held firmly at $3 and $3.25 for red, and $4 and 4.25 for yellow Denvers.

St Louis.—FLOUR active; fancy at $6.10 cash; $6.12½ March; choice at $5 85 cash; $6@7.50 May; family, $5.72½@5.15 cash; $5.75 February, and $5.85 April; treble extra at $5.75 asked. WHEAT opened higher, but declined; No. 2 red fall at $1.23½@1 23½ cash; $1.26@1.27 March; $1.28¾@1.29¾ April; $1.31¾ May; No 3 do. at $1.21 1-2. CORN dull at 33¾@33⅞c cash; 34¾@35⅛c March; 36@36 1 2c April; 37 1-2@37⅝c May. OATS weak at 33 1-2@33¾c cash; 34c February; 37c May. RYE higher at 73 1-2c. PORK quiet at $12.15. LARD lower at $7@7 05. BULK-MEATS firmer; shoulders at $3 95@4 05; clear ribs at $6 40@6 50; clear sides at $6 50@6 60. BACON steady; shoulders at 5c; clear ribs at $7 25@7 30; clear sides at $7 40@7 45. HOGS steady; light shipping at $4 10@4 25; packing at $4 20@4 40; butchers' to select at $4 40@4 50. CATTLE—fair run, mainly of steers, which sold at a shade lower prices; shipping steers, 1,600 lbs average, at $5 50; 1,550 lbs average at $5 25@5 35; good at $5@5 20; choice spayed heifers at $4 12 1-2; cows and heifers scarce at $2 75@3 65; feeding steers at $4@4 25; receipts, 1,700 head; shipments, 900 head. SHEEP strong and higher; fair to good light at $3 50@4 25; do heavy at $4 50@5 25; exports at $5 50@6; receipts, 1,700 head.

Toledo.—Wheat dull; amber Michigan, spot, $1 29¾; No. 2 red winter, spot, $1 30¾; March, $1 32½; May at $1 36¾ bid; No. 3 red Wabash $1 14. CORN dull; high mixed at 39½c.; No. 2, spot, at 38½c.; May at 42½c.; No 2 white at 43c.; rejected at 38½c. OATS quiet at 33c. for No. 2. CLOVER SEED—prime $4 60; No. 2 at $4 45. DRESSED HOGS at $5 10@5 12½.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 1, 1880.

BEANS AND PEAS.—The bean trade does not swerve as larkely as was expected, and the lately marked up rates are now very extreme. There has been a fair demand for marrows for export, but the market is now quiet. Mediums very dull, the total demand hardly supporting extreme prices, though are moderate. Red Kidneys have rather more movement; other fancy beans quiet. Green Peas slightly favor buyers, as their wants were well supplied early in the season. No. 1, c. peas nominal at $2.25 per 2 bu bag. Medium beans, prime, $1.47@1.50; other, $1.45@1.50; marrow beans, prime, $1.70@1.75; other, $1.55@1.65; pea, 1.50@$1.70. white kidney, $1.60@1 80; red, kidney, $1 55@1.75; black, 1.75@$1.80. Receipts of beans, 6,450; exports, 1,160 pckgs.

BEESWAX.—Transactions are confined to small lots, and quotations made of 24½@25½c for Western and Southern.

BROOM CORN—Offerings are small and firm prices held. Quotations are for choice brush at 9c.; choice hurl at 8c.; stalk braid at 6@7c.; mixed red and green at 6@6c.

BUTTER.—The situation of the market is not essentially changed. The advent of colder weather has not imparted the expected snap to the consumptive demand, and there is a free offering of sound, useful lots and lines fully as cheap as last week. Very choice table grade is firm, though a shade off from last quotations. Shippers have neglected State this week, as Western has favored them in quality in their view of prices. Winter made butter is falling off in quality. All parcels show a lack of what gives it precedence, ample grain feeding. Dealers do not anticipate much surplus at the close of the season, but a large bulk of both State and Western has lost merit sufficiently to make all large holders keep a finger upon the export pulse. In exceptional cases for home use, last week's prices are still quoted, but as a rule there is more stock selling at the inside start of the ranges.

Comparative receipts and exports past four years:

DRIED FRUITS.—Apples have a moderate degree of attention and prices steady. Peaches are quiet and unchanged. Small fruits are moderately offered and rule at firm prices. For apples—New N.C., at 7@8¾c. for fair to good; 9@9¾c. for choice; 10@10¾c for fancy sliced. Patent evaporated, apples, choice, in cases, at 13¾@14c.; do. good and prime, 12¾@13c.; N. Y. State sliced, new, 7¾@8c.; do, quarters, 6¾@8c.; new southern quarters and nominal; new North Carolina peeled peaches 17@18c., do., Georgia, 13¾@16¾c. Peaches—Delaware evaporated, peeled at 24@28c.; do. unpeeled at 13@15c.; new halves at 8@8 c. and quarters at 7@7¾c. Blackberries at 9¾c. bid for new. Raspberries at 25c. Pitted cherries at 18@19c

EGGS.—Receipts for the week, 6,645 bbls.; do. last week 5,950 do. The demand has improved, and as stock is of better average quality, there is some speculative inquiry with the approach of Lent. The following exclamation is instructive for new shippers: "A receiver selling his eggs for first quality at the mark has to guarantee his stock to make a loss of only a dozen or so to a barrel, if the loss exceeds that he has to make it good. Loss off generally means a little more than actual loss; it gives the buyer the counting out and permits him to count everything doubtful in his own favor." Prices close stronger.

Near points, per doz., 20c.; State and Penn., 18@19c.; Western and Southern, choice, 18@18½c.; Tennessee, 18c.; poor marks, Canadian and Western, 14@15c.; limed, State, 12½@14c.; Canadian, 12@13c.; Western, 11@13c.

FRESH FRUITS.—Exports of apples past week, 3,050 bbls. The market for apples is quiet, and few varieties are quotable in a wholesome way. Baldwins poor to choice, $1.75@3 ₱ bbl.; Greenings, $1.50@2.75. Fresh receipts sold not exceed $4.75. Export demand light, with unfavorable cable. Cranberries continue to have a good outside demand, which supports prices. Cape Cod, good to fancy, $7.50@9; other Eastern, $6.50@8.50; N. J. crates, $2.25@2.75. Flor da oranges run poor; many cases have sold at $1.50@$2.50; repacked quoted at $3.50; a few extra original pckgs. have sold for fancy use at $4; all hal bbl. cases. Strawberries are in fine order; culls, 50@60c.; best, 75@80c. ₱ quart. Grapes are higher, owing to scarcity, Catawba, $2.50@4 ₱ case. Peanuts have had a prosperous season; market very firm at 5¾@6c. ₱ lb.; Hand-picked Va., good to fancy, 5¾@6c.; Shelled, 5¾@6c. Hickory nuts, 75@87c. Pecans, 10c.

FLOUR—Has been very dull and lower until the close, when improved foreign advices caused a good deal of activity and 10 to 15c. per bbl. better prices.

Latest figures are $4.40@5 25 for inferior to very choice superfine State; $5@5 40 for inferior to choice extra do., odd lots and lines; $5.40@5.75 for good to very choice do.; $4 50@5.25 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $5.15@5.40 for inferior to good shipping extra do., and $5.40@5.75 for good to very choice shipping extra do.; inferior to about choice white wheat extras $5.40@5.50 choice to very fancy do. $5.50@8.00, the latter an extreme; red and amber winter wheat, inferior to fancy trade and family at $5.60@7.50; round hoop Ohio, $5.30@5.85; and trade and family brands of do. at $5 90@7.50; the latter rate for very choice; St. Louis at $5 60@6.40 for inferior to good extra; $6 40@7.75 for good to very fancy; Minnesota clear, very inferior to fancy, at $5.30@6.50; Minnesota "straight," very inferior to very choice, at $5 65@7 65 and patent inferior to fancy, at $6 50@8.50; unsound stock at from $3 00@5 25; city mill extra at $6.10@6.75 for ordinary to fancy for West Indies do. for England, $5.15@5 75 for poor to choice; do. trade and family extras, $6.75@7.75; do. for South America, $6.40@6.75; No. 2 at $3.75@4.60 for poor to very fancy.

FURS AND SKINS.—Arrivals are large, and with prospective free receipts the market closes tamely.

Bear, Northern Black, $7@10; S. & N., yearlings, $4 Beaver, N. ₱ skin, $1@5; do., W. & S., 50c.@$3; Badger, 75c.@$1; Cat, Wild, 20@40c.; Fisher, N. & E., each, $7@9; do., S. & W., $3@4; Fox, Silver, as to beauty $15@50; do., Cross, N. & E., $3@4; do., Red, N. & E., $1.40@1.75; do., S. Penn., Ind., Mo., Neb. and K n., 20@50c.; Geo., Ark., Fla. and Ala., 25@40c.; Skunks, prime black, No. 1, cased, $1@1.10; do., No. 1, open, 90c.@$1 do., half striped, 45@60c.; do., striped, 25@30c.; do., white, 10@15c.; Wolf skins; mountain, large, $1 50@2; do., prairie, prime, 50@60c., Fisher, $6@10.

GRAIN.—Wheat has shown a much better business from exporters towards the close, and prices are stronger. Latest sales are of No. 1 white at $1.43@1.44; do., February, at $1.42½@1.43¾; do., March, at $1.44¼@1.45⅛; do., April, $1.46@1.46⅜; do., May option, at $1.45@1.46¾; ungraded white at $1.40@1.43; No. 2 red at 1.45¾@1.46⅝ do., February, at $1.45¼@1 46¾; do., March, at $1.47¾@1.48⅛; do April option, at $1.48¾ a1 49⅜; do., May, at $1.49 @1 49¾; No. 3 red at Kansas trade at $1.35; ungraded red at $1.40@1 44; No. 1 Green Bay and Duluth spring, at $1.40; No. 2 Chicago and Milwaukee, $1.38@1.39. New York No 2 spring at $1.38; No. 3 spring at $1.30@1.32; ungraded spring at $1.28¾@1.30. Rye is held up to $1, and 95c, reported offered for full lots. Corn is more freely offered and favors buyers; latest sales are of old No. 2 at 61@61¾c. do. in store at 60c; do., February, at 59c.; do. March, at 55¾@56c. do., April, at 54@54c.; do., May, at 54c.; New York steamer mixed at 58@59¼c. do., February, at 57¼58c. do., April, at 53c.; ungraded mixed western at 57@61c., New York No. 3 at 57@57¾c. Oats are in full supply and favor buyers; latest sales are of No. 1 white, at 50 c.; No. 2 white at 48½@49c. No. 3 white at 47¾@48c. New York No 1 at 48¾@48¾c.; New York No. 2 at 47¾ 48c.; New York No. 3 at 47½c.; ungraded white western at 49@51¾c.; ungraded mixed western at 47½@49c.; white State at 50@52c.; mixed State at 49c.; No. 2 Chicago afloat at 48¾c. asked.

HAY AND STRAW.—Receipts continue moderate and as the demand is active, very strong prices are made. Shipping hay quoted at 75c.; retail lots at 80@85c. for medium, and 85@90c. for prime; clover at 65@70c. Straw at $1@.05 for long rye; 65@70c. for short rye, and 55@60c. for oat.

Exports of hay for week 1,390 bales.

HOPS.—The market has remained very quiet. Choice and fancy lots are held firmly, but buyers do not close out other than imperative orders. The lower grades are freely offered. Prices are for:

	Cents per lb.
New York, fancy	38 @40
New York, new crop, good and choice	33 @36
New York, new crop, medium	31 @33
New York, new crop, low to fair	27 @29
Eastern, new crop	27 @35
Wisconsin, new crop	27 @35
Yearlings	7 @18
Olds, all growths	4 @ 0
Pacific Coast, new	30 @35
Pacific Coast, olds (nominal)	5 @10
Bavarians	45 @60

MAPLE-SUGAR.—A small, fine invoice of Ohio, thought to be a consignment, is retailing at 25c.

SEEDS.—Grass are quiet; clover is quoted at 8 for prime Western, 8½@9 for choice and extra choice Western, and 9¾@10½ for State, the latter price for strictly fancy.

TOBACCO.—There is an improved export and home trade demand, and prices very firm. Quotations are for

OIL-CAKE.—Western is quoted at $43 per ton.

POULTRY AND GAME.—Dressed poultry rules steady with a limited demand. Scarce game helps fine chickens and prime.

Turkeys, N. J., 12½@13c.; State and prime Western, 12@13c.; other Western, 10@11c.; Philadelphia dry-picked, 14@14c.; do., fowls, 10@11c.; N. J. do., 10@11c.; chickens, Pa. dry picked, 13@14½c.; N. J., 12@13c.; State, 11c.; Western, poor to prime, 8@10c.; ducks 13@16c.; geese, 8@11c; Capons, large, ₱ lb. 20@22c.; small and slips 16@18c.; squabs, dark, ₱ doz. $2@2 25; do., white, $3.75@4.

Strong, prices are quoted for the short list of game.

Wild pigeons, flight, prime, ₱ doz., $1.87@2; scorn fed, $1,62@1 75; wild ducks, Canvas back, Havre de Grace, ₱ pair, $3.50; Western, $3@1.25; Norfolk, $3; Red head, H. de G., $1 50; Western, $1.50; Norfolk, $1 25; Mallard, Western, 87@85c; Mallard and Black, Norfolk, 75@80c.; Teal, Western, 50c.; common, do., 40@50c.; Norfolk, 30@40c.

Live poultry sells well, when prime. N. J., 9@10c.; Western, 7¾@8c.; roosters, 4@5c. Turkeys remain low, 7@8c.; ducks, 70c.@$1 ₱ pair; geese, $1.62@1.75 choice; other, $1@1.50.

PROVISIONS.—Hog products have been urged at lower prices, closing weak at $12.50 for February; $12.60@12 70 for do. for March and $12.75 for do. for April. Bacon at $7.05@7 10 for long clear and $7.25@7 30 for short clear. Beef—Extra mess at $11@12; plain mess, $10.50@11; packet, $11.50@12.50; tierced beef, city extra India mess, at $ 0@22.00. Beef Hams at $17. Lard—Western steam at $7 60 for spot lots; $7.60@7.62½ for new for February $7.62½ for new for March; $7.70 for April. Steerine at 7¾@7¾. Tallow at 6¾@6¾c.

VEGETABLES—Export of potatoes for week, 5,820 bbls. The stock here is large, and further liberal supplies of State and Eastern are available; the market favors buyers. E. Rose, Nova Scotia, $1.00@1.50, bulk; Prolific, $1.25@1 80, do.; in d.-h., $1.37@$1.62; Mercer, $1.12@1.37, bulk; Early Rose, Maine, $1.75@1.87, d.-h.; State $1.40@$1.62, d.-h.; $1.37@1.50, bulk; Peachblows, white, $1.87@2.00, d.-h.; do. red, $1 75@1.87, d.-h.; Snowflake, $1 37@1.62, d.-h.; State Peerless, $1.25@$1.50; N. J., do., $1@1.12 Sweet potatoes, 3 00@$3.25; few wanted. Hot-house rhubarb quoted at $1 50 ₱ doz; do. radishes, $1.00 ₱ doz. Lettuce $1.25@1.50 ₱ doz. Fla. green peas $1.50@2.50 ₱ crate; not in good order. Norf. kale, per bl, $1@1.25; do. Spinach, $2.50@3 00. Balt. do., $2.25@2.50. Marrow squash, $1.25@$1.50; Hubbard, $1 75@2.00. Cabbage, ₱ per 100, $4@8. Onions, white, $1.80@4.00 ₱ bbl.; yellow, $3 00@3 25; red, $2.75@3; Chester, $2.25@2.75. Russia turnips and carrots, 75c.@$1 Celery, per doz., $2@3.

Sharp weather has cut off supplies of many items, and the market is higher for several winter items.

WOOL.—There has been much more activity this week, and with stocks being steadily reduced, prices are very firm. Quotations are for domestic fleeces:

Ohio Pennsylvania, and West Virginia—XXX, 55@58c.; XX, 51@55c.; X, 50@53c.; No. 1, 55@57c.; No. 2, 47@50c.; coarse, 43@46c.; combing, 53@57c.

New York, Michigan, and Wisconsin—XX, 47@50c.; X, 47@50c.; No. 1, 52@55c.; No. 2, 46@50c.; coarse, 2@40c.; combing, 51@54c.

Indiana, Kentucky and Tennessee—X and XX, 46@50c.; No. 1, 52@55c.; No. 2, 46@50c.; coarse, 38@40c.; combing, 50@54c.; combing unwashed 37@42c.

Illinois, Iowa and Minnesota—X and XX 43@47c.; No 1, 48@52c.; No. 2, 43@45c.; coarse, 47@40c.

Georgia, Alabama, Mississippi and Louisiana—fine unwashed, 43@45c.; medium unwashed, 40@43c.; coarse unwashed, 30@33c.; burry, 18@24c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Feb. 7.

BEEVES.—Receipts for the week 11,073 head; do last week, 11,934 do. The market has had a more active run of trade than it did last week, colder weather helping the demand. At the close prices have an improved tone, and in the main the $1 per head last week has been regained. Common to prime steers sold at 8¼@10¼c., dress 51@56 lbs.; extra and premium, 10½@10¾c., dress 57 lbs.

SHEEP AND LAMBS.—Receipts for the week, 29,741 head; do. last week, 24,481 do. Stock has sold up quite clean this week, and there is a better tone to prices at the close. Some very common sheep sold at 4½c.; general range, 5¼@6¼c. Lambs not over plenty at 7@7½c.

COWS AND CALVES.—There is a small demand for fine milkers, and $80 has been paid during the week. A good range is $55@65; stock quoted below $55 not wanted here.

VEAL CALVES.—Supplies of live are light, and the market is firm for any good quality. N. J. and Bucks Co choice, 8¾@8¾c.; others, including State, 6¾@8¼c Mount Holly, 300 lbs., down to light, prime, 5¾@8¼c. Dressed calves doing well; selling, upon arrival, at the advanced price; choice, 11½@12c.; other 9¼@11c. Buttermilk calves, 4¼@5½c.; grassers 3@3½c.

SWINE.—Receipts for the week, 32,491 head; do. last week, 21,673 do.; market steady at 5 5¾c. Country pork higher: 6¼@6½c. dressed, 6¼@6¾c heavy, 6c.@6¾c.; city dressed, 6¾@6¾c.; Western, 5¾@5¾c.; tenderloins, 9c.

A Liberal Offer.—The VOLTAIC BELT CO., of Marshall, Mich., have such implicit confidence in their Electro-voltaic Belts, Bands, Trusses, and other appliances, that they offer to send them, on thirty days' trial, to all persons suffering from nervous difficulties, rheumatism, dyspepsia, ruptures, etc., etc. By their use cures are speedily effected, and all sufferers are invited to send for their illustrated pamphlet.

TERMS FOR 1880.

Reading for the Young.

GRAFTING.

UNCLE MARK.

THE members of the Horticultural Club have now enjoyed a long vacation from active work in their gardens. I do not, however, for a moment suppose that they have been idle during the last three months. Most of them have house plants that have needed their daily attention, and all of them, I have no doubt, have been busy laying plans for the work they intend to do in their gardens during the coming summer. We may now begin to look for the coming of spring. The sun is coming farther north with each passing day, melting the snow, breaking up the ice and restoring nature to life and activity as he goes along. Indeed, gentle spring has already come to our Southern cousins, and is now softly and stealthily creeping northward, passing degree after degree of latitude, and will, in not many weeks hence, have expanded over all the Northern States clear to the British line. But I did not mean to tell the cousins how the warm season advances as the sun comes northward, or how it all comes about that we have these climatic changes, for this they already know; but I did mean to remind all the young gardeners that it is now time they get ready to commence work out of doors. For some of them it is high time. In the Gulf States vegetable and flower seeds should be sown by the middle of February; and from this date the seed time will vary with the latitude, till at the middle or latter part of May, spring has reached the northern limit of the United States.

GRAFTING

being one of the early spring operations, I intend to make this the subject for a few remarks. In the first place, I want every member of the Horticultural Club, boys and girls, young and old, short and tall, to learn how to graft; and I desire them all to become familiar with this idea, and to make an effort to learn it. It is an art that may be useful or at least a source of pleasure to everybody. It is not the nurseryman alone who may profit by it. Everybody who owns or expects to own a piece of ground large enough to plant a tree upon, may find profit and pleasure in knowing how to graft. Nor is it exclusively for the boys, though it naturally falls in their sphere of activity; the girls, too, may find it to their advantage; indeed, many of the best educated and most refined ladies are enthusiastic gardeners.

The art of grafting is very old. It was well known by the old Greeks and Romans, and the latter practiced methods that have been transmitted to this late day. The French are, at present, best skilled in the art. There are a great many ways of grafting, all of which have the same end in view, namely: that of uniting a twig, or small branch, of one tree with the trunk, or stock, of another, so that the two shall grow together and form one tree. The object in grafting is, for the most part to propagate varieties which can be increased in no other way, and retain their peculiar characteristics. Nature propagates trees by seed; but seedling trees are so very seldom exactly like their parents, that we cannot perpetuate the good qualities of a fruit in that way. If a man, for example, has one Baldwin apple tree, and he wants another, he will not get it by planting the seeds of a Baldwin apple. The seeds would grow up and form apple trees, but it is extremely unlikely that the fruit these would bear would be, in all respects, like the apple from which the seeds were taken; hence, to get another tree that will bear fruit, which shall be like the first one, he must propagate it by grafting. A grafted tree will also bear fruit at an earlier age than a seedling, which is another object in grafting. And again, by a judicious choice of stock, a grafted tree may be made to thrive in climates and localities where it otherwise would be a failure.

THE NECESSARY TOOLS

consist of a sharp knife, a small pruning saw, some broad, soft strands of bast, or else some strips of muslin, and some grafting wax. The wax can be bought in many seed stores, but if none can readily be obtained, a good grafting wax is made as follows: Melt together 4 ounces of beeswax and 2 ounces resin; in a separate pot melt 2 ounces of thick turpentine, and stir it into the wax when fluid; then add to it all a little tallow or lard, and stir well together. This should, when used, be kept fluid, so it can be applied with a brush. Besides these, one must, of course, have the *stocks*, or trees to be grafted, and the *scions*, or young branches which are to be inserted into the stocks. Of the many methods of grafting, I shall name only a few of the most practical, and of these will first mention

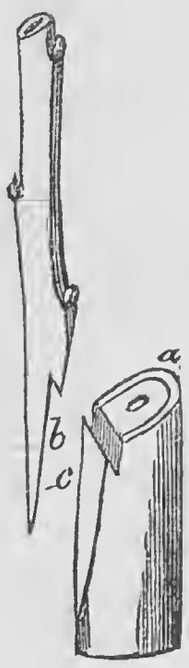

FIG. 52.

BARK-GRAFTING.

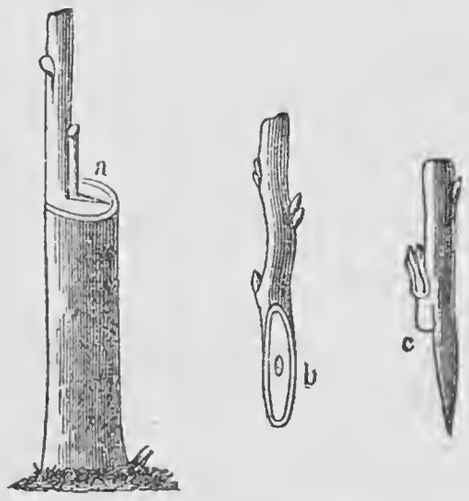
It is done in the spring, as soon as *the bark on the stock is loose*. The method is illustrated in fig. 50. With the saw the stock is cut off from six to twelve inches above ground, with a clear cut, a. Next an oval, clear cut, from an inch to an inch and a half in length, is made on the scion, b, on which should remain only two to four buds. On a smooth spot of the stock, a cut is then made downward through the bark, about as long as the cut surface on the scion, and opening the corners a little, the scion is pressed down between the bark and the wood as seen at a. A little bast is then wound about it to keep it in place, and the whole wound is covered with grafting wax, to exclude the air. Should the scion be rather thick, a transverse cut can be made in it, forming a notch as shown at c.; it is not then so easily pushed out of place. Bark-grafting is one of the best methods to insure success, but, strange enough, it is so little known in this country that even some nurserymen practice the violent cleft-grafting in cases where the above method could be used to advantage. It is especially suitable for regrafting old trees, and when the stock is much larger than the scion.

SIDE-GRAFTING

is another excellent method. It is shown in fig. 51. It differs from the former in that here the scion is not inserted under the bark, but instead, a portion of the bark and wood is cut away from the side of the stock (a, fig. 51), and the two cut surfaces of the scion and stock are fitted together. As shown in the figure the bark of the scion fits against the bark of the stock on one side, and in this position they are tied together, and the wound covered with grafting wax.

SIDE-TONGUE-GRAFTING

is still another method; see fig. 52. The stock, a, is cut off smoothly, and a portion of the bark and wood is shaved off as is in side-grafting; but, in



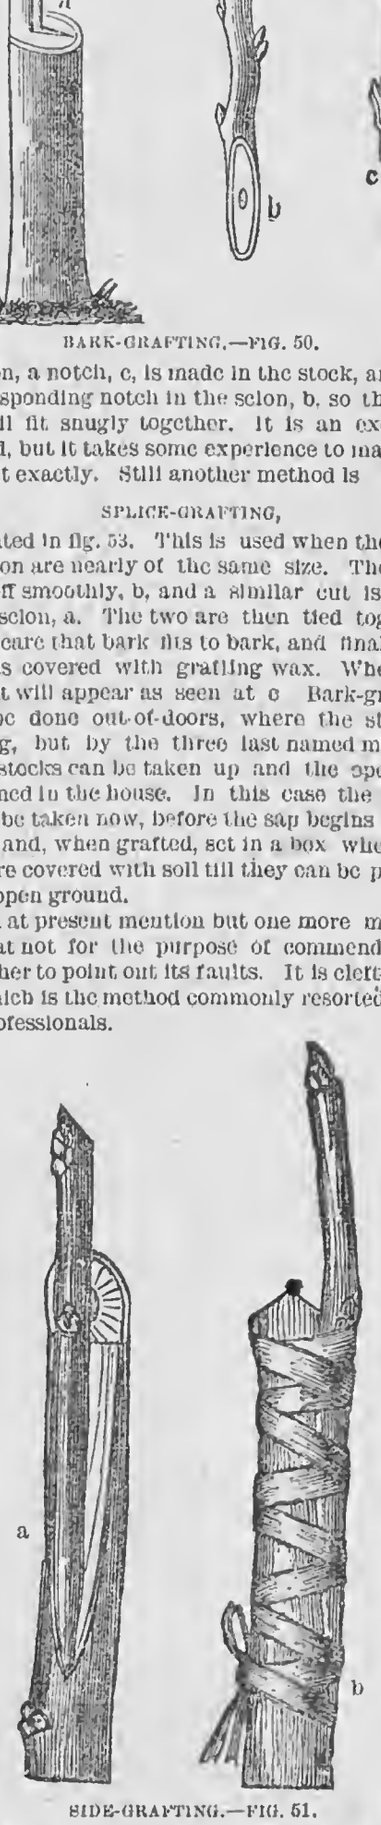
BARK-GRAFTING.—FIG. 50.

addition, a notch, c, is made in the stock, and also a corresponding notch in the scion, b, so that the two will fit snugly together. It is an excellent method, but it takes some experience to make the scion fit exactly. Still another method is

SPLICE-GRAFTING,

illustrated in fig. 53. This is used when the stock and scion are nearly of the same size. The stock is cut off smoothly, b, and a similar cut is made on the scion, a. The two are then tied together, taking care that bark fits to bark, and finally the whole is covered with grafting wax. When finished, it will appear as seen at c. Bark-grafting must be done out-of-doors, where the stock is growing, but by the three last named methods young stocks can be taken up and the operation performed in the house. In this case the stocks should be taken now, before the sap begins to circulate, and, when grafted, set in a box where the roots are covered with soil till they can be planted in the open ground.

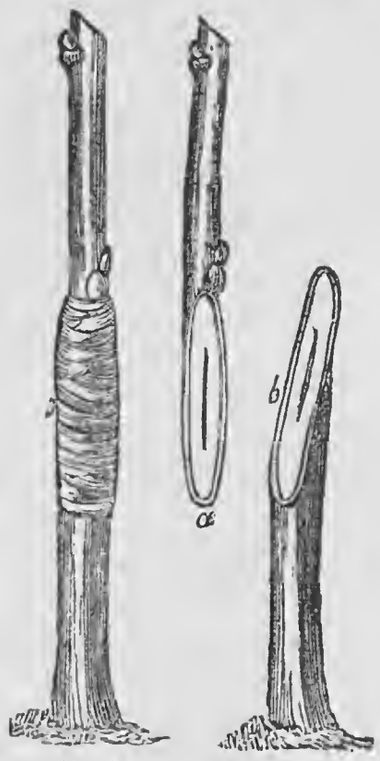
I will at present mention but one more method, and that not for the purpose of commending it, but rather to point out its faults. It is cleft-grafting, which is the method commonly resorted to by non-professionals.



SIDE-GRAFTING.—FIG. 51.

The stock is cut off as in the other cases, but instead of setting the scion under the bark or on the side, the trunk is split through the middle and the scion inserted in the cleft or opening thus formed, taking care that bark fits to bark. The objection is that the operation is too violent and necessarily weakens the vitality of the tree. In every case, it takes a longer time to heal the wound than by any of the former methods, and sometimes the gaping, decaying stump of the trunk may be visible for years before the new growth covers it up. Do not be misled into grafting your trees in this way, because it is common to do so; not every practice in common use is the best that can be devised.

Now a word in regard to getting the stocks. These are seedling trees which nurserymen raise for the purpose, and those of the members who live near a nursery can readily get some. Chance seedlings also spring up in every orchard, these will be of value to practice upon. In fact, every one can find stocks in some way, especially by engaging an elder brother or friend to help. The scions should be taken from last year's growth of some good varieties of apples and pears. Pears are grafted on pear seedlings, and apples on apple seedlings. The scion should never have less than two nor more than four buds, and unless the stock is very large, only one scion should be grafted on each. If two are inserted and both should grow,



SPLICE-GRAFTING.—FIG. 53.

the weaker one must be cut off in the course of the first summer. Graft close to the ground and form the trunk of the new shoot.

I have endeavored to be plain in this description, and by studying the illustrations, all will, I trust, readily understand the different methods. Enterprising boys can soon become expert nurserymen, and aside from the pleasure derived from the work, make a handsome salary, an example of which is given in the story of the Fruit Grower's Family, which the Rev. H. S. Clubb has, from time to time, contributed to these columns.

The Puzzler.

HIDDEN CAPITOLS.

1. 'Tis past, Paulina.
2. Ashtah Lequah is a squaw.
3. I saw Ned Esmo in Essex.

Sabbath Reading.

BEARING THE CROSS.

BY PATIENCE CRENSHAW.

SUFFERER divine! Thou who didst go
With toiling footsteps, sad and slow,
Bowed down beneath such weight of woe
As only thou canst ever know,
What debt of love I owe to thee
That thou the cross didst bear for me!

The pain, the shame, the grief, were thine,
The pardon and the peace are mine;
Springs in my heart thy life divine,
And opening heavens above me shine,
While all my powers sing praise to thee
That thou the cross hast borne for me.

And thou dost call me to the cross,
And for its sake all else but loss
Must I esteem. Earth's gold is dross,
Her favor vain, her fame a gloss;
How can they tempt me from the place
Where I may look upon thy face!

In lowly fellowship with thee
Let me a burden-bearer be,
And for life's painful mystery
Teach me thy loving sympathy;
That so my cross I too may bear,
And so thy cup of sorrow share.

JOHN THE BAPTIST AND JESUS CHRIST.

JOHN the Baptist and Jesus the Christ, in their relations to one another, are the symbols of great and eternal facts in religious truth and experience. These two figures and these two lives pass before us like a beautiful and instructive allegory. On the one hand, we see starting up in the wilderness a wild, rude form, wrapped in a coarse blanket, with a countenance expressive of spiritual sadness and wearing the traces of ascetic habit. The desert resounds with his stern accents, and all hearts fall under his searching and unsparing exposure of their sin. Is not this the immemorial type of Law, and of the Repentance with which it is commissioned to work in awakened consciences?

And now this other figure, which comes treading in the footsteps of the desert preacher. On his face is a most winning light. His voice is sweet and low, his food and dress are those of other men his way is among their homes and haunts; he gives his sanction to social and domestic life; he is the healer of the blind, the leprous and the demoniac; on his lips is the word of pardon and peace, he comes to seek and to save that which was lost. He is more than the type, he is the incarnate realization, of the Gospel. He represents Faith and Forgiveness, those elements of religious truth and experience which are to the former as the time of the tender grape and the voice of the turtle dove, the appearing of flowers and the green fig, the time of the singing of birds, is to the winter when it is past and the rain when it is over and gone. For it is the voice of our Beloved, who has come over the mountains of our sin, and standing by the wall of our earthly homes shows himself through the lattice of our daily lives.—*Christian Intelligencer.*

ASKING TO GO HOME.

THE Springfield Sabbath Republican has a pretty story of two little children who went alone on a recent Sunday to church, when a minister from out of town preached. They took a seat near the front, and after the minister had got well into his sermon the smallest child whispered to his sister that he would like to go home. People who sat behind them heard the little girl tell him that he must not go without asking the minister's permission; so hand in hand they left their seat, and standing before the clergyman, the little chap lisped out his petition. The minister was naturally surprised, but, without interrupting his discourse nodded his assent. That did not satisfy the children, and again the boy asked permission to go, and was answered by another nod. The little girl, fearing the minister had not understood her brother, said, "Please, sir, may brother and I go home?" The minister stopped and verbally granted their request, and, with a sweet "thank you, sir," and a courtesy, the children went down the aisle together.

IN order to grow in grace, we must be much alone. It is not in society—even Christian society—that the soul grows most vigorously. In one single quiet hour of prayer it will often make more progress than in days of company with others. It is in the desert that the dew falls freshest and the air is purest.—*H. Bonar.*

IF Christians must contend, let it be like the olive and the vine, which shall bear the most and best fruit; not like the aspen and the elm, which shall make the most noise in the wind.—*Jeremy Taylor.*

PRAYER in the morning is the key that opens to us God's mercies and blessings. Prayer in the evening is the key that shuts us up under His protection and safeguard.—*Rutherford*

HE who makes the fullest use of God's gifts is their real owner, for property does not become possession until the proprietor becomes the master.—*S. S. Times.*

GOOD men have the fewest fears. He has but one who fears to do wrong. He has a thousand who has overcome that one.

THE best of all prayers, is to act with a pure intention, and with a continual reference to the will of God.—*Fenelon.*

PERSONAL ITEMS.

Miss Rogers, a cousin of Richard Cobden, was the prodigy in the last examinations at Oxford university, England, outstripping all the other students, male and female, in Greek and Latin. Her knowledge in other branches is quite as wonderful. After passing her examination, Miss Rogers was at once appointed lecturer in Somerville Hall, one of the Oxford buildings for women students.

There are in the English House of Peers, at the opening of this year, 21 dukes, of whom 11 are Conservatives—Beaufort, Buckingham, Leeds, Manchester, Marlborough, Norfolk, Northumberland, Portland, Richmond, Rutland, Wellington; eight are Liberals—Bedford, Cleveland, Devonshire, Grafton, St. Albans, Somerset, Sutherland, Westminster; one has never voted—Hamilton; and one, Newcastle, is a minor.

Lazy and dull feelings are sure precursors of sickness, which nothing but Hop Bitters will banish.

BRIEFLETS.

Mr. Brooks in an address before the W. N. Y. H. S. said: "We all had currant bushes that took care of themselves and gave us plenty of rather small currants; but finally the worms ate them up. Professor Morse told us to give the worms hellebore, but the skeptical folks said they didn't believe there was any such medicine, and the orthodox said they would not waste it on worms. So we lost our currants." . . "It is agreed in our county that small fruits must take care of themselves. Blackberries and black-raspberries conform to our arrangement. They set themselves out in the spare places, and do everything but pick themselves. If your Society wants to do anything respectable, they will get up a sort that will pick themselves." . . The reveries of the dreamer advance his hopes, but not their realization. One good hour of earnest work is worth a thousand dreams of success towards insuring it. . . Clawson Wheat, it appears, has decidedly improved in quality in Michigan during the past year, being more flinty and making better flour. . . Our readers in ordering hardy low-growing trees this spring should not forget the beautiful Japan Maples. . . . Mr. Kenny says: "Buy no cane mills of less weight than 750 pounds, if you intend to have one strong enough to stay by you. Always bear in mind, the larger the capacity of the machinery, the less your sirup will cost you per gallon. . . "Keep the feet warm" is an old maxim—but children's necks are better covered than their legs and feet.—Journal of Chemistry. . . Mr. Brewer corroborates the statement that black pepper will kill the Cabbage-worm. . . Mr. Hoffman (Elmira Farmers' Club) thinks that the Cabbage-worm will soon disappear. . . Mr. Williams says: "I believe it not only possible but the duty of every land-holder, even if limited to a city lot, to grow grapes for his own family." . . Speaking of the decline of the Isabella, Catawba, &c., Mr. Williams says: "My own conviction is that there is a limit, a maximum point, when strength, health, vigor and fruitfulness are in their fulness. This level may be maintained for a longer or shorter period, but beyond it is decline." . . The "boom" has not made its appearance as yet in the grocery market, but nevertheless it is confidently looked for.—Grocer. . . The advance of civilization has had a twofold and contrary effect of reducing the price of wares, and at the same time multiplying a hundred-fold the artificial wants of society. The luxuries of one generation become the necessities of the next. . . We see that the same portrait is used in different catalogues for McLean's "Little Gem" and "American Wonder" peas. This is robbing Peter to pay Paul, unless Peter and Paul are the same "fellah." . . Artemus Ward gave the following Hints to Farmers:—To drain your land—Spend all your time at the village groggery, and your land will be drained in equal ratio. . . To clean a lot from cobblestones—Get up a target in your neighbor's garden, and invite all the boys to come and throw at the mark. . . To raise a crop of grass—Rent your farm and engage in politics. Your lands, property and character will go to grass in a brief space of time. . . No kissing by telephone for us. We prefer to take the electricity direct from the battery.—Osculatory Whitehall Times. . . Now the Hayden trial is over, the ladies will have an opportunity to attend to the prosaic duties of housekeeping.—New Haven Register. . . "We have more wants and more means to meet those wants than any other people.—Gov. Seymour. . . Prof. Stewart considers ensilage as the one thing needful to winter dairying. . . Mr. J. A. Hedges is engaged in the good work of pressing upon State authorities the importance of embracing the sugar-making business in the course of studies of the agricultural colleges of the country. . . A Maine man who didn't care two shakes of a lamb's tail about the newspapers rode fourteen miles through a fierce snowstorm to get a copy of a weekly that spoke of him as "a prominent citizen."—Boston Post. . . For Sale.—Golden Rural Tomato—Beauty of Hebron—Holstein cattle—Clydesdale horses—Cow-peas—See advertising columns. . . Mr. Quinn says that most of the Raspberries introduced during the last ten years received the same high praise now bestowed on the Cuthbert. We think not. . . "Didn't you tell me you could hold the plow?" said a farmer to an Irishman he had taken on trial. "Be aisy, now," says Pat; "how could I hould it an' two horses pulliu' it away? Just stop the craytures and I'll hould it for ye." . . Apply carbolic acid to the wound when stung by a bee. . . It seems that Burlington, Iowa, according to the Health Dept. of N. Y. city, is the healthiest city in this country. . . French bread is so light as to be full of "airy nothingness." It is made to *please the eye!* . . It is a pity to be reminded, says . Olcott in the Christian Union, that a funeral is the only social incident that brings out the whole rural neighborhood. . .

EVOLUTION.

Correct Your Faults

Of digestion with Hostetter's Stomach Bitters, a medicine which removes flatulence, heartburn, irregularity of the bowels, poverty of the blood and all shifting, harrassing, perplexing symptoms of dyspepsia, as well as their cause. A conspicuous change in the appearance as well as in the feelings of those who use the Bitters takes place as the distressing symptoms disappear, and the stomach, liver and bowels reassume their function in full force and activity. The haggard appearance of the countenance and sallowness of dyspeptics are supplanted by a healthier look, and as the food is assimilated, the body acquires substance. Appetite, without which food does comparatively little good, is restored, and the nervous system refreshed with much needed slumber, through the use of this medicine, which is also beneficial to persons of a rheumatic tendency, and an inestimable preventive of fever and ague.

Field Crops.

THE CULTURE AND USE OF MANGELS.

HENRY STEWART.

It is but a few years since the profitable culture of roots was held to be one of the impossibilities of our agriculture. The climate was considered to be unsuitable for a crop which held in its cellular tissue 90 or more per cent. of water, and such was the force of this mistaken impression that any one who attempted to grow a crop of roots was considered as a very foolish man. It was said, and is even now said, and insisted upon by persons who would not like to be included among the "old fogies" that corn held a superior position as a feeding crop to any roots whatever; that while we could raise corn of some kind on any sort of land, the trouble and cost of a crop of roots were uselessly undertaken and only failure could result from the attempt. Besides, said they:—"What will you do with your roots when you have them? If you should be so foolish as to raise three or four acres of them and have as many thousand bushels, where will you put them and what will you feed them to?" This was considered a sort of poser which squelched argument and was followed always by the clincher: "No, sir! you can't grow roots here; and if you could, you don't want them; you have corn and what do you want besides?" But then came the knowledge that corn was a very incomplete food of itself, and although it would fatten an animal very well, it was not fitted to sustain the system of a growing or a milking animal, and something was needed to feed with it to perfect the nutritive ratio of the food, and that roots were precisely the sort of addition that was required. Corn, corn fodder and roots together made up precisely the nutritive elements in the exact proportion required. And then our scientific farmers saw the point at once, and set themselves to grow roots—and succeeded. Now, American farmers can grow roots as well as any English farmer ever could, with their advantageous climate; as good in quality; in fact, better, because more solid and less succulent; as large in size and as heavy in the yield. We can grow mangels anywhere from 24 to 40 pounds' weight, if we wish and at a cost that renders them the cheapest food we have. Forty tons per acre, equal to 1,200 bushels, are grown by good farmers who understand the needed culture, and any farmer may grow as many, who will follow the right method. Is there any crop that will pay better? Mangels contain over one per cent. of flesh-forming material which is worth 4¾ cents per pound, and 10 per cent. of carbohydrates worth one cent per pound. This is for the fresh roots having 88 per cent. of water in them. At 14¾ cents per 100 pounds, equal to 8¾ cents per bushel, a crop of 40 tons gives a return of $113.75 per acre. To realize as much from corn one must grow nearly 200 bushels per acre. It requires but little figuring to discover which is the more profitable crop.

We need to grow roots. They exert a beneficial influence upon the soil; not directly, but growing out of the necessities of their culture. The land must be well worked, must be well manured and must be kept free from weeds. A truly honest farmer, I mean one who is honest to himself, and his profession and to his farm, should grow roots for this very reason, because the work disciplines him, in fact, will make a good and successful farmer of him.

WEBB'S NEW KINVER YELLOW GLOBE MANGEL.—Fig. 54.
Lengthwise Section of one of Average Size as Raised at the Rural Experiment Grounds.

Let us consider what he must do. There must be a stock of good well rotted manure prepared. This is indispensable, and the ground should have been well plowed before winter sets in. But the manure must be had, if roots are desired. To grow one acre, then, there should be 25 loads of manure made, turned over three or four times, kept fermenting through the winter and prepared for use early next May. This is disciplinary and useful work; it enriches the farm and the farmer, and the labor will give him higher ideas than are usually held regarding this work of making manure. Instead of being considered as filthy, disagreeable work, the manure heap will be to him a laboratory experiment; carefully prepared; well made; fully performed; and its results watched with great interest. It will bring in the intellect to the aid of the hands and arms, and will set in action a new order of affairs on the farm, as anything will do that is done for a purpose. This is the winter's work. Next comes the seed: six pounds for an acre is the quantity required.

The next consideration is the variety. After growing, the past year, twelve different varieties of mangels and beets, I would select the Kinver Yellow Globe for its soundness, color and yield. Next I would choose Lane's Improved sugar beet, and I would grow half an acre of each, if I had but one acre. I like variety and so do my cows: and if I can induce a cow to eat a few pounds more of sliced roots for her noon-day meal, she will rest the better in the afternoon, and milk the better in the evening for it; and by giving a change week about, with these two roots, the sweeter sugar beets seem to keep up the cow's appetite.

The spring work, next, is to be thought about. If I could procure, or afford to procure a grubber, I would use that to work the fall-plowed ground. This loosens the soil for 10 inches in depth without turning it over, and makes it in the very best condition for growing roots. Not having such an implement, I would cross-plow the ground after spreading the manure, and so mix the soil and manure, and then still further mix it by thorough harrowing. The soil is then marked out in furrows as straight as possible, 27 inches apart. In the mean time the seed is soaking, and as soon as the furrows are made, before the soil has had time to dry, the seed is sown by hand in them, and a man or boy following, covers them about two inches deep with a hoe. A distinct mark of each furrow is still left by which it may be seen with ease. Three hundred pounds per acre of Peruvian Guano, blood manure, superphosphate of lime or specially prepared mangel and beet fertilizer are then scattered along the row and a few inches on each side. By soaking a small portion of the seed, the portion that will grow will be ascertained, and this is important, because 50 per cent. of old seed will be dead, and in that case a double allowance will be required. Although a hand seed drill is a convenience, yet I think the greater trouble of hand sowing will be repaid in the more regular and even growth afterwards. After planting, the ground needs cultivation before the weeds start; this is the least trouble and it is

easier to kill a thousand weeds when they first germinate than one when it is a week or two old; and to keep them from growing, than to destroy them when grown. A week's neglect, once the weeds have started, may increase the labor 50 times and even make it necessary to abandon the crop. This is *the* point in growing roots. Keep the ground clean, and some sort of a crop is certain; permit weeds to grow, and the chance is great that the crop will be a loss.

There may be farmers who have a crop of roots grown and find difficulty in disposing of them. That difficulty is easily disposed of. There is not an animal on the farm but may be kept in the best of health and condition on roots, with a small portion of dry feed. Horses do well on a peck twice a day, chopped and mixed with chaffed hay. If hard worked a quart of meal of any kind or bran, added, will complete a sufficient ration. Cows, oxen, calves and feeding beeves flourish well on roots as the largest part of their diet. The yellow-fleshed mangels give a rich color and no evil flavor to milk or cream, and for winter dairying they are indispensable. A peck of roots with a quart of cotton-seed meal and bran, mixed in equal parts, given twice a day with dry hay or fodder, will keep cows well up to their milk. Sheep may be fed similarly in proportion, except ewes heavy in lamb, which should be fed but small rations, not over a quart at each half daily feed. Pigs thrive wonderfully on mangels and sugar beets. Geese will live wholly on them chopped fine. Poultry will peck out roots and consume them completely. Roots, corn and hay will keep the whole farm stock going in the best order, and as one good acre of roots will subsist one cow for three years or 25 cows for six weeks, and four acres will supply 25 cows for six months, what other crop can pay so well or be so easily grown for the amount of feed procured?

KINVER GLOBE MANGELS.

COL. F. D. CURTIS.

I HAVE grown Webb's Kinver Globe beet for several years and have fully tested its merits, except by actual analysis of its constituents, I am satisfied that it contains a much larger per cent. of sugar than the larger and coarser mangels, but not as much as the white sugar beet. My pigs are fonder of it than of any other root except the sugar beet. It is more easily grown than the latter and will afford a larger yield; and it is not excelled in regard to yield by Lane's Improved. As there are but few rootlets on the sides, and the tap-root is slender and fine, it can be harvested clean and pulled without the least difficulty. It is urged as an objection to it, that it is too easily lifted out of the ground. Care must be had in running the cultivator between the rows, or the mangels will be pulled up, and also in turning the horse, or they will be knocked out by the animal's feet. This trouble can be obviated by sowing some stronger-rooted variety at the ends of the rows. I can fatten pigs on this beet, feeding it raw, and breeding sows may be kept healthy on it and do well. My horses eat it and all beets greedily, and for cattle there is none better. One quarter more bulk of the Norbiton Giant Mangel, can be grown on the same ground, but I doubt if there is any more actual nutriment.

Kinver Globe Mangels originated in England, where they are very popular. The Globe variety has not been so popular in this country of large things, as the Norbiton Giant. It is finer in grain and will keep better, than any of the long mangels. The smaller ones are excellent for the table. It is a rich yellow in color, and the leaves are also yellow, running into green on the edges. The roots do not average so large a size as swedes, which are similar in form. There are several good kinds of Kinver Globe, but Webb's is undoubtedly the best. The Globe variety can be grown closer in the rows than the long, red mangels, and the rows may be nearer together, so far as a good growth is concerned, but this makes it more difficult to work between them and not to disturb the roots. It is not so liable to be injured by freezing, as the beets are closer to the ground—do not stand up so high. There is no soft neck or crown as is the case with the long mangel, which is exceedingly sensitive to the frost, and when frozen will cause the whole beet to decay. The seed this year is scarce and high. When crowded in the row in rich ground the beets will grow on top of each other, and not twist together like the long mangels. The earlier the seed is put in, the larger will be the yield.

Of the Webb's Kinver Globe Mangel we are assured that as much as eighty-four tons per acre have been grown; though of course, nothing like so enormous a yield can be expected from ordinary field culture and manuring. The variety has been extensively grown by leading stock owners in England, and it has proved extremely satisfactory for feeding purposes. In a number of places where it has been tested here too, it has won golden opinions for large yield and good quality.

Horticultural.

FRUIT GROWERS IN COUNCIL.

New Jersey Hort'l Society.

AFTERNOON SESSION.

(Rural Special Report.—Continued from last week.)

RASPBERRIES were discussed as follows:

Mr. Goldsmith named Franconia; Hornet, Fastolff, etc., as of best quality but none of them was hardy. Highland Hardy was supposed to be hardy; but four years' trial proved it not entirely so. His were badly injured last winter. It was early and profitable, selling at 25 and 30 cents per quart. After the middle of July the prices ran low—too many other fruits in competition. The Hudson River Antwerp was still good. He had seen them sold in market at six and eight cents with two commissions to come out. He could not grow raspberries at that price. He planted in rows six to seven feet apart and three feet in the row, confining the young plants wanted for fruiting to a space about 18 inches wide, cultivating between the rows. He stretched a wire over the row, to which the tops of the fruiting canes were fastened. Thinks cultivators generally agree that young plants are more hardy than old ones. He doubted if winter killing was due to *severe* cold weather. Mr. Fuller said the Raspberry is indigenous to, and at home in a northern latitude. As you go to western N. Y., and Canada the Franconia and other varieties are perfectly hardy, while the further south you go, the more tender they are as compared with this place, and to attempt to cultivate them there is a failure. The same is true of the Currant. A Raspberry that will hold its leaves until winter, may be regarded as hardy. Mr. Voorhees thought killing was due to unripe wood. Mr. Lovett had never seen the Turner hurt to any extent. He considered the Cuthbert practically hardy. Mr. Barclay grew Fastolff on the south side of a tight fence till he got tired of covering the vines, and dug them out. Some roots ran under the fence, came up and grew on the north side and were always hardy. Mr. Crane grew Raspberries in his apple orchard. He had observed they did best under the trees in the shade. More were injured last winter than usual. He was not ready to give up Highland Hardy or Philadelphia yet. The latter was valuable for home use. He had grown 150 bushels per acre, but the people began to want something better. Mr. Downing visited him a few years ago and, seeing the perfection it attained on his soil, told him he need not look for anything better; if he did, he would not find it.

Mr. Roe said many varieties, like the Philadelphia, seem adapted especially to certain localities. This was the case with all more or less. He praised the Cuthbert. He had seen the Queen of the Market doing well far to the south and considered it identical with Cuthbert. If so, he believed it would do well as far south as Norfolk; he would risk it there anyway. Mr. Quinn remarked that all Raspberries introduced for the past 10 years had been as highly praised as the Cuthbert is now. Take, for instance, the Herstine! And where does it stand to-day? He thought any one planting any quantity of Cuthberts without first trying it in a small way would make a mistake. A few costly plants generally received extra culture; they did with him, and he presumed the same was true with others, and the result of this treatment was not a fair test for a large plantation. The Philadelphia had been overpraised. Last season in the Newark market they could hardly be given away. Mr. Crane indorsed the remarks of Mr. Quinn on the Cuthbert. He bought 50 plants two years ago and lost every one. He had tried it again last year with the same result. He went to see a neighbor who had bought a dozen plants, to learn his success; he had saved three only and they were "growing small by degrees and beautifully less." Mr. Roe thought the Herstine the best early variety he had. He had admitted none was absolutely hardy unless it was the Turner. He did not think the Cuthbert always hardy. He believed in telling the truth about it. He had seen it killed to the ground, but when once established its vigor is remarkable. Mr. Fuller believed the Turner about as hardy as any we have, but too soft to bear transportation. The quality is good.

The Secretary read a paper on Grape-growing for the People, and by the People, in which he contended that any place fit for human abode could be and ought to be made to produce a family supply, and urged it as a duty that every owner of a lot—even if but a small city one—owed to his family to grow a home supply of this delicious fruit which was a medicine to the sick, a refreshment to the weary and a luxury to which those dependent on the markets were strangers. The cooling shade and luscious fruit amply compensated for the trouble and expense of preparing, planting and caring for the vines. He deprecated the advice so frequently given—to keep the roots constantly deluged with soap-suds and kitchen slops. No vines could remain healthy with such treatment. He preferred transplanted vines grown from ripe wood in the open ground. No hot-house or greenwood vines for him. He urged that purchasers should never buy of any but trustworthy and well known nurserymen.

Among the new Grapes of promise he named Ricketts's Lady Washington, Miner's seedlings, Caywood's Duchess, Niagara, Prentiss and Pocklington, some of which on trial he hoped would come near to the claims put forth for them by their originators, and meet the want long felt of a good, hardy, productive white grape superior to the Concord.

After deciding to hold the next annual meeting in Newark, and arranging for publishing their proceedings, and some miscellaneous business, the Society adjourned *sine die*, and thus closed one of the most interesting meetings this young Society has ever held.

If the bulk of the members, including some of the ablest, would take half the interest that a few of the real workers do, this Society would soon exert an influence that would be seen and felt throughout the country, and be of incalculable benefit to every tiller of the soil. W.

THE LETTUCE DISEASE AND ITS PREVENTION AND CURE.

JAMES TAPLIN.

THE above disease is not a new trouble, for it has prevailed more or less ever since the plants have been grown in houses heated by fire heat, but probably some winters it is more troublesome than in others, so much so that some growers have given up the crop and grown other things in their houses. I notice a recommendation to discontinue growing the crop in old gardens for a time as a remedy; this might be a cure if it was an insect, but it being a mildew closely related to the vine mildew, I do not see what good will result from doing so, as under the same circumstances it will appear again if the crop is grown again in any number of years after. I was informed by a large grower he had never been troubled with it in cold-frames, but always more or less in hot-houses.

For reasons which need not be entered into here, I occupied a part of two houses with lettuce this winter; from want of water the plants could not be planted until after being checked by the first sharp frost while outside, which would predispose them to disease. After the only snow storm we had which laid a day or two on the roofs of these houses, I noticed mildew on many of the leaves. I at once painted the pipes with lime and sulphur, gave a brisk heat and plenty of air in the day and less heat at night, and it disappeared in a few days, the leaves affected dried up and could be picked off, and although a few heads were decayed the general crop was saved.

As a preventive I would recommend cleaning out all the old soil and rubbish, of which there is usually a good stock in that sort of house, wash the wood and glass, and repaint if necessary, and paint walls and pipes with lime and sulphur, and fill in with fresh soil, and with proper attention to the watering, ventilation and heat, I do not see any cause why the former success should not be obtained.

HOW TO OBTAIN VERY EARLY TOMATOES.—We start about 1st to 10th of March in hot-bed; transplant when about three inches high to another bed, first cutting out the tap-root. When about six inches high transplant to four inches apart, and when 10 inches high nip out the top and transplant to 10 or 12 inches apart. Leave until safe from frost and take to the field, which should have been plowed about as early in the spring as peas can be planted. Run over with a harrow or roller to pack solid, Line and mark to 3½x4 feet. Spade out a hole 12@15 inches square, 8 inches deep. Put in plant and fill around with mellow soil. Keep water suckers off and you will have tomatoes 15 days ahead of any one. M. WELSH.

Farm Topics.

HISTORY OF A POOR FARM.—No. 23.

Some Pertinent Criticisms.

OUR meetings have become quite notorious since our discussion of some family arrangements which were rather severely criticised, and the matter having leaked out, probably through our out-spoken and matter-of-fact young lady visitor, has been a subject of village conversation, gossip and comment. Dr. Jones who has the best facilities for hearing and learning of the opinions of the farmers' wives and daughters, says the remarks made have been very popularly received and several ladies have intimated that they would be pleased to have an opportunity of recording their opinions on various similar matters. The suggestion staggered Mr. Martin, who seemed to think that it would be impossible to discuss any practical matters within bounded limits with a few lady visitors as speakers.

"I want" said he "to ask Dr. Jones one thing, and that is this; 'Why farmers' wives become insane?' I have just been reading a long article in a paper in which this question is asked, and a column full of reasons are given why farmers' wives and daughters cannot help but become crazy because of their cares and hard duties.'"

"A man is little better than a lunatic himself" remarked Dr. Jones, "to write any such stuff. Unfortunately there are diseased minds as well as diseased bodies, and as a large proportion of the population live on farms, of course a large proportion of sick and diseased persons are found in farmers' families. Fred can probably tell us within half a dozen how many farmers we have in the United States."

"The latest estimate is that there are over four million farms at the present time, and, of course, as many farmers; the average number in a family is five, so that 20,000,000 persons, or nearly half the population, live on farms."

"But not half the idiots or crazy folks, I warrant you," remarked my old neighbor. "I have lived here, boy and man, for 87 years this New Year's, and I have known every family within a dozen miles or more since I was sheriff of the county over 40 years ago, and I have never known one insane person in a farmer's family.

"You are right," rejoined Dr. Jones. "I have been well acquainted with farmers' families all my life, and, as a rule, they are more robust and long-lived than any other class; the children are strong and hardy, and the majority of cases of sickness in country places is caused by carelessness, inattention and inexcusable disregard of sanitary requirements. Farm life is so healthful that carelessness becomes a rule. On the contrary, look at the women and children in towns and cities, and if there is a place where 'cares and hard duties,' exposures and privations, should cause nervous prostration and mental disease, it is in a crowded city tenement house; and the wife most likely to become insane, is the mother of a family of a city workman. There is no class of people more healthy, sound in body and mind, and long-lived, than farmers."

"Well, that is satisfactory. Now, I want to know why we farmers cannot have pork and beans for our dinners three times a week without having the fact thrown in our faces by a magazine writer as evidence of our poverty, ignorance, misery and general boorishness. What do you say to that, doctor?"

"I am from New England and, of course, cannot give an unprejudiced opinion; but I am sure that pork is wholesome and nutritious food and that much nonsense and stupidity are written about it. The hard work of the world is done on pork; and I may add, beans. Beans, too, form one of the most nutritious foods. Sailors live chiefly on pork and beans. These are the staple food of the lumberers in the timber districts, men who do more hard work and suffer as much exposure as sailors. Soldiers are obliged to eat a good deal of pork. Miners make pork their staple flesh diet, and necessarily consume a large quantity of beans. Laborers everywhere consume pork largely. The Cuban slaves are fed on it. "Hog and hominy" used to be the usual food of our Southern negroes. An enormous quantity of American pork and bacon is exported to add to the products of other countries, and if pork were unwholesome food, it would not be thus widely consumed. I use more pork myself in a year than of any one other kind of meat, and good bacon or ham never comes amiss, even to a man of refined taste. A pig is no more uncleanly a feeder than, if so much so, as a fowl, which is as filthy a forager as exists, yet who makes any objection to broiled chicken on that account A rabbit is infested with as many parasites as a pig, and yet its flesh is never objected to, not that by any means a pig need necessarily be infested with these creatures at all, if it is properly kept. Oxen are infested with embryo tape-worms in their flesh, and sheep are specially subject to parasites."

"You have been reading critically of late, Mr. Martin," I remarked.

"Yes. I am sick of the way some people who write in agricultural papers have of lecturing farmers about what they ought to do; as though they were children, and as to say; 'Johnny, you should not put your fingers in your nose; or you should not scratch your head; or you should keep your hands clean and not crawl in the sand and wear the knees of your pants, or play in the mud and make your mother angry.' Farmers surely have as much common sense as other people, and know what to eat and drink as well as their neighbors."

"At the dairy fair we were told by a speaker, who could not know what he was talking about," rejoined Miss Martin, "that we ought to get cows that would milk 12 quarts a day for 300 days in the year. I don't believe there are a hundred such cows in the country, which is not enough to go around and give 4,000,000 farmers one apiece. If we cannot make money

in the dairy without such cows, there's a poor look out for us, I think. And there's another thing I have noticed—how is it that the men get all the premiums for the best dairy butter? Do they take care of the milk and the cream, and churn and make the butter, and wash and keep clean the pans and pails? I don't think it. If farmers' wives get mad, that's enough to make them mad I think; to get up some nice butter and their husbands take it to the fair and Mr. So-and-so gets the premium and pockets the money, instead of the woman who had all the work to do. To be pleased about that is one of 'the hard duties,' I suppose, that fall upon the women."

"That certainly is a great evil," I replied, "but it might easily be remedied by making the entries in the names of the persons who actually made the butter and by awarding the premiums to them only. Your complaint is just, and I hope it will go where it will do some good.

"The fact is, that among agricultural writers there is a tendency to be too practical and too specific, and particular: it is as though a preacher should habitually address each of his hearers by name, and recount to him each of his peculiar failings and peccadilloes, and some imaginary ones, too, and publicly admonish him that this should be avoided and that should be done; instead of teaching general principles which each one could apply to his own case as his conscience would prompt. In agriculture there is an infinite number of differences and variations, and one can seldom be specific. Every writer should be a teacher. If he has not something to teach that readers do not already know, he has no "call," and should remain among the learners. We want new facts, and old ones sometimes that appear in new shapes experiences, suggestions and observations that may be applied as they may suit any particular case.

"Farmers, as a rule, want to know what other farmers are doing, because among a thousand men doing the same thing, some one will discover a better or an easier way of doing it, by which all may profit; but they don't want to be told they are boors because they eat more pork than may suit the taste of one who never experienced the appetite gained by a morning's work behind the plow; nor the swiftness with which a hearty dinner of pork and beans will disappear in the afternoon through the same work. Nor do they appreciate the lecturing which calls their work "tiresome and unvarying drudgery and an unvarying round of drudge-like duties" etc; nor to be charged with a want of ordinary human kindness and family affection, through which wives and daughters are brought to insanity. They don't want to be "preached" to or at, but they want, and are ready to receive and appreciate useful information."

"It is not long since" remarked Mr. Martin, "that the papers were full of the isolation and lonesomeness of farmers and one genius proposed that all the houses and barns should be built in a village and the stock driven to and from the farms two or three miles, all the feed hauled there, and the manure drawn away, and all this for the purpose of enabling farmers and their families to visit each other and gossip. This would be a costly recreation. It is very good of such people to be so careful of our comfort, but very unwise to make our boys and girls discontented and to believe that there is something about farm life that is degrading, disagreeable and uncivilizing; when the truth is, that morality, honesty, comfort, independence, domestic happiness and quiet content flourish the most in our farm homes and among industrious, healthful and useful farmers. It is pleasant and profitable to visit among one's neighbors, and an hour or two of conversation between intelligent men and women cannot fail to be to both interesting and useful. There is no need for farmers to be isolated and lonesome. There may be the farmers' club for discussing practical matters; the farmers' reading and book association; the farm improvement society; the ladies' society and other useful means of mutual benefit and culture, and a sufficient number of persons to maintain such associations may be found within easy walking and driving distance of each others' homes.

Dairy Husbandry.

WINTER BUTTER MAKING.—No. 3.

HENRY STEWART.

The Dairy.

If the first requisite for good butter is the cow, the second is the dairy room or house, for it is useless to procure good milk, if it is spoiled in the keeping. A dairy room should have an even temperature, and in the winter may be kept at 45 to 50 degrees. One that is partly underground and has an apartment over it for churning and washing, pans, etc., is preferable, as it will need no artificial heating by a stove. I prefer one with brick walls, white-washed with lime, plastered over-head, and with a cement or flag-stone floor; that has the windows above ground and facing the south and west; the windows covered with fine wire gauze outside and hinged at the top, so that they may be opened by raising and hooking up the sash. The window being close to the ceiling, ventilates the room completely. My own aim in a dairy house is a building having a brick basement in a hill-side, with ice-house in the rear, having a chute on the bank through which to put in ice; and the milk room in the front, with porch for airing the cans and pails. Over the milk room shall be the churning and washing room, provided with a water heater, and with an elevator for passing cream and butter up and down, and stairs leading below; also a sink with taps from a tank above. Over the milk room shall be a tank supplied from a well, by a wind-mill overtopping the whole. From the tank, water may flow through a pipe into the rooms below, for use in washing pans or supplying water in case the submerged-can system of setting the milk might be used at any time. A sink and drain may also be carried from the milk room. The tank will be high enough to supply the house and the barn with water through pipes. The cost of the whole I estimate to be about $600 for a dairy of 50 cows, and no one can doubt that it will be a profitable investment for the maker of extra butter.

The Churning.

When I enter this part of my subject I touch a broad field, over which lie in perspective the ghosts of a score or more of discarded and departed churns. The misery of a butter-maker is the endless variety of churns. There are many good churns, beginning with the old-fashioned, up-and-down one, which recalls my boyhood when I waited for my cup of fresh buttermilk, and often waited three hours; for in those days the whole milk was churned. Now I can get my buttermilk in eight minutes, or less, by the old kitchen clock, which never varies from year's end to year's end. But it is not from an up-and-down churn, which, although it makes good butter, is a man and woman-killer; it is now from a "rectangular" churn, and it is *right* angled without any doubt, for the butter not only comes quickly, but in such an excellent shape, being beaten about by these proper angles, as to greatly facilitate the washing and preparing of the butter.

To particularize, let me recall the churning of the 7th day of January, 1880; because this was an eventful one, and settled in my mind some questions which were previously doubtful to me. My cross-bred three-year-old Jersey and Ayrshire cow, Maida, had been fresh two weeks, and this was the first churning of six days' milk. The cream—12 quarts exactly—was turned into the rectangular churn aforesaid, and the churn and cream were both at a temperature of 65 degrees. After churning for eight minutes precisely, making 70 revolutions of the churn per minute, I was surprised to hear the "slap-dash" of the buttermilk, and was more than surprised on opening the churn to see so magnificent a sample of butter. The mass of golden butter was in small grains from the size of sago grains up to that of buckshot, lying in an irregular mass piled up in the churn with a small quantity of buttermilk at the bottom. The butter weighed 10½ pounds. The result, 10½ pounds of butter from 12 quarts of thick cream, churned in eight minutes, at a temperature of 65 degrees, settled some points about which questions are frequently asked.

This churning out of the way, the cream of two Ayrshire cows three-years-old that have been milking 10 months and are three in calf—14 quarts in all—was put in the churn at a temperature of 60 degrees. This I churned three hours patiently without breaking the cream, and was advised to throw the cream out as it was one of those messes which would never churn. Let us try some warm water. A quart of hot water from the kettle was thrown in, the churn rotated, and in one minute the butter came; the temperature in the churn then was 64 degrees. This also goes some way to settle another difficulty in winter dairying, which causes a great deal of trouble.

If butter comes at 64 or 65 degrees in a short time and fails to come at all at 60 degrees, this is a valuable fact to know. Another churning of Malda's cream of 16 quarts from seven days' milk produces 14 pounds of butter in 12 minutes at a temperature of 65 degrees, with several stoppages to watch the progress; so that eight quarts of nearly pure cream will make seven pounds of butter.

Churns

The Tartars are said to do their churning by putting the milk in a sheep-skin bottle which they tie to the saddle and take a brisk gallop for an hour or two; on returning the butter is made. This is the original horse-power churn. But its principle is clearly the same as that of our best modern churns, viz: agitation of the milk in a vessel in which the contents are dashed from one side to another to break up the butter globules. This is the principle of all the dashless churns of which so many of such various shapes were shown at the late International Dairy Fair. The peculiar action of these churns produces the butter in small globules, as above mentioned, and in this shape the milk can be drawn off and the cold water or brine introduced into the churn, and the butter thoroughly washed and made ready for immediate packing. Certainly of the many churns which I have used, the "Rectangular" pleases me the most, on account of its very easy motion, its shape, which is a hollow cube suspended diagonally upon two of its opposite corners, its freedom from iron gudgeons penetrating inside as is usual in dash churns and which *will* blacken and foul the butter, and chiefly on account of the ease and perfection with which it can be cleansed, its quick churning and the excellent shape in which the butter comes.

Coloring Butter.

My customers are very exacting people. They object to light-colored butter and, like the majority of consumers, they judge of butter by the eye as well as by the flavor. Recently the New York Farmers' Club "resolved" that coloring butter was a fraud and a practice to be denounced. Do these *farmers* wear their cassimeres of the natural shoddy color or do they prefer them dyed? Did they object to the coloring of oleomargarine when they resolved over that, and insist that that fraud should bear its natural tallow color? The fact is, butter is colored because those who buy it *will* have it colored to suit their taste; and while colored butter will sell the best, so long will butter be colored. One teaspoonful of good liquid butter coloring in 12 gallons of cream is needed even with Jersey cows in the winter, and for other cows twice that quantity will be required to give a color somewhat lighter than that of a gold coin.

There is nothing about annatto that is objectionable, and all the talk about its filthy preparation is simply "bosh" and falsehood. When color is used it is best to put it into the churn, and I do not find that it has any ill effect whatever even upon the buttermilk, which is a pleasant, wholesome article of food when the milk is all right.

Bitter Cream.

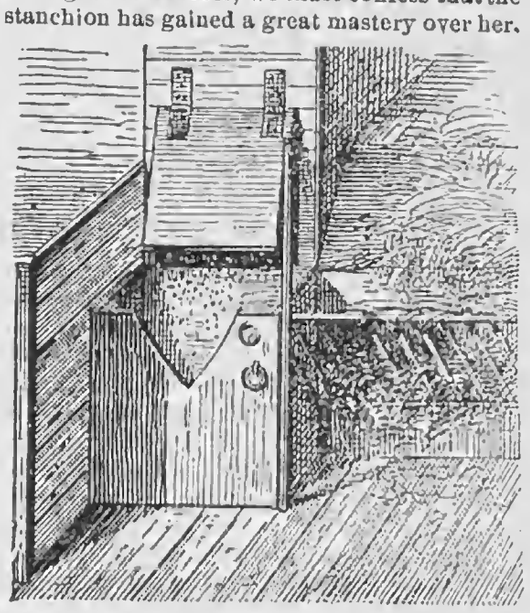
This reminds me of the many complaints of bitter cream in the winter. This is caused invariably, I believe, by something in the food or in the condition of the cow. Every one knows how prevalent that vile plant, bitter weed or rag weed, (Ambrosia artemisiæfolia) is; and how much of it is cut with the second cutting of the meadows,—the much-praised-for-butter rowen hay. This weed will give to milk, cream or butter, a very bitter flavor, which no process or disguise can conceal. If turnips are fed, I defy any person to escape bitter cream and ill-flavored butter. The presence of a heap of turnips on my barn floor the past winter so impregnated the air, although none were fed, that the milk was perceptibly flavored by them until they were removed. Feeding immediately after or before milking is unavailing. There are cows which from some peculiarity of condition give milk which turns bitter. Such cows should be discarded from a winter dairy as soon as the fault is discovered, for they are not healthy and their secretions are not pure. The mixture of a pinch of saltpeter in a six-quart pan of milk will remove or disguise this bitterness, I cannot say which.

How Butter may be Spoiled.

Good butter may be spoiled in the churning. Over-churning ruins the texture and changes the proper waxiness to a disagreeable, sticky greasiness. This is the more easily done in the churns with revolving dashers, which will press the butter against the side of the churn and squeeze and rub it until it is spoiled. Too long churning spoils the quality by the oxidation of the butter and the premature formation of strong-flavored acids in it, the full preserving presence of which we call rancidity. It may be spoiled by churning at too high a temperature, by which it is made soft and oily, and of a greasy texture and flavor. No subsequent treatment can remedy this error. It may be spoiled before the cream reaches the churn by keeping this too long, or what is practically the same, by keeping it in too warm a place; 50 degrees is about the right temperature if cream is kept a week; if it is kept at 62 degrees, three days are long enough. White specs are produced in butter by over-churning, or by having the cream too sour. Either of these faults produces curd in the milk and the small flakes of this cannot be washed out of the butter. Milk from a cow in ill health, and that is acid when drawn, will produce specky butter. So will the use of salt containing particles of lime, which unite with the butter and form insoluble lime soap. White specs are covered up to a large extent by using good coloring, which is made of oil as the solvent. But this use of a coloring, being to disguise a fault and to add an undeserved virtue, is worthy of the denunciation of even the Farmers' Club.

A NOVEL COW-STALL.

It has long been a matter of dispute between both practical and theoretical dairymen, as to which is the better contrivance for a cow—a stall or a stanchion. The latter certainly has many good points to recommend it. It is the perfection of discipline and control over the cow, and when we remember what a sovereign contempt a cow has for the spirit of order or the rights of another, we must confess that the stanchion has gained a great mastery over her.



COW STALL.—FIG. 55.

There are, however, feelings of regard, and especially of sentimentalism, to be taken into consideration by many dairymen and by most breeders of blooded cattle. Cows in stanchions look as though they were pilloried and held by the neck in a most uncomfortable condition. Large cows are particularly clumsy and apparently very uncomfortable in these close quarters. Whether or not cows can actually be made to give more milk—which, after all, is the criterion—in any arrangement yet devised than in the stanchion, is a question that needs much evidence to determine. Almost without exception, the practical dairies of the country are supplied with stanchions. They are cheap in construction and economical of space. I have examined many other designs in use for keeping cows in stalls—fastened by chains, straps and halters—and tried to devise an improvement on them. The above design, fig. 55, after many changes, running through years of hard experience in trying to make the cow not only comfortable but at the same time to keep her under complete control, was finally adopted as being the most complete within my experience for compassing these ends.

One great trouble with cows when fed ground feed in stalls, arises from their disposition to take up a large mouthful, and then turn their heads from over the manger, and, while chewing, waste nearly one-half the feed upon the floor. To prevent this, each has to put her head deep in the manger to get the feed. The swinging door through which she is fed, prevents her from putting her mouth over in the alley-way. A post or upright prevents her from putting her mouth over the hay-rack to the right of her. The only way she can get out is to back out, which she is never inclined to do until the feed is all gone. She meets with this same trouble in wasting her hay. The depth of the feeding-trough which runs to the floor, prevents her from rooting the feed out. The notch cut in the front of the feeding-trough allows young things to reach the bottom, but prevents them from stepping into the trough, which they are all inclined to do. The fastening was a broad leather strap around the neck, with a strong chain and clasp to fasten them in the stall. The stall partitions were five feet high, sloping to four feet, and four feet in depth. The floor should be five feet and a half from the manger to the drop. The full width of the stall is five feet. This was designed for thoroughbred stock, and seemed to meet all their requirements.

The Poultry Yard.

ARTIFICIAL INCUBATION.

BY HENRY HALES.

One important feature in the use of incubators is that you can use your eggs whenever you get them, without running after or waiting for sitting hens. This is worth something to breeders of valuable poultry; good eggs are often sacrificed from lack of opportunity to set them. On the other hand, when this occurs it is only one setting that is lost, but with an incubator, if anything goes wrong, a whole batch of eggs is destroyed—perhaps a hundred at one time. There are numbers of incubators of various sorts for sale, and I have carefully watched and inquired as to their practical results. The general tale is: "I would have hatched so many, or *so* many, *if* it had not been for an accident to the lamp regulator," or because some other intricate arrangement went wrong. What is wanted is a simple and effective machine, with nothing to get out of order, and at a reasonable price. It is these pretty little adjustments that upset the calculations about chicks; it is the absence of

these "*ifs*" that would bring an incubator to the level of a hen, which would always hatch. It is the uncertainty of hens that the incubator should rectify.

Some object to incubators as unnatural. Certainly nothing is so noble as a hen mother when she *is* reliable: but incubators must be reliable too. I know several noted breeders who tried the artificial hatching, and gave it up, but I see no reason why a machine may not yet be brought out, simplified so that it needs neither an electrician nor a scientist to watch it all the time—one that any ordinary person can attend to. One noticeable defect in the present complicated machines, is that if the lamp burns too low, there is nothing to turn on more heat; if it burns too high the regulator for the purpose turns it down, *if* it works properly. A machine is very subject to atmospheric influences, as every change in the weather has an effect upon the incubator, which must be watched closely to keep up the proper heat at all times. With continued watching, there is no doubt any complicated machine will do the work, as it is effectually done in at least one large establishment in which attendants are at hand night and day. But this will not do for ordinary work; there is too much care.

As to the unnaturalness of it—ducks, turkeys and pheasants are raised better by hens than by their own mothers, and if incubators will improve on hens, they may be used to advantage; but they must be simple, maintaining a regular heat without continual attention, and at such a price that they may be within the reach of most breeders and farmers. If I can find any such machine I will try to procure one, "run" it next spring, and give the results to the RURAL NEW-YORKER.

Pekin Ducks.

I notice what F. H. D. says in a late Rural, about Pekin ducks, that he does not consider them as profitable as the smaller breeds. What smaller breeds? Please tell us; also tell us if the smaller breeds are of any profit, and in what this profit consists, whether in eggs, in meat, or to sell as fancy poultry or water fowl. Please tells us, Mr. F. H. D., what you know about it? As you ask those who have tried them to tell what they know about them, especially if they do not breed them for sale at fancy prices, I will tell what I know about them. In our family, which is a large one, we use a good many eggs and like them in many ways, and hearing of the Pekin ducks as great layers, we bought a trio of young ducks in the fall of 1878. They began to lay in February, and March, in 1879. They laid without interruption till June; then they seemed inclined to sit, which we did not let them do; consequently, they soon began to lay again, and laid till the last of August. We killed off our surplus stock last fall, sold at a cheap price a trio to a friend, and now have a trio for the year 1880. Those now on hand have been laying for some time. If they continue as those did last year, we think they will do pretty well. They had a small stream of water to spend their daytime in, or on its banks, as they choose. The stream is a spring brook, with water sufficient to water all farm stock in the driest seasons, as it has done since the settlement of the country to this time. We feed them a little corn at night when they come up. They will not eat any at any other time when they can have the run of the brook. This winter is so warm that the brook has been frozen over only a few days; hence they have begun to lay sooner than last year. Now, what more can ducks do to make themselves profitable? And what breed of smaller ducks will do better? Will F. H. D., please tell?—We have no ducks for sale.

Rome, N. Y. JONATHAN TALCOTT.

FOWLS EATING EACH OTHERS' FEATHERS.—Unless fowls have a small quantity of meat two or three times per week in the winter season—and daily is still better—they are apt to get into the injurious habit of picking each others' feathers on the head and neck and around the rump. In the summer, if allowed to run out where they can find plenty of insects, they rarely do this. Pressed scraps are for sale in most towns at a low price, which are excellent to feed poultry; but those who are near a butcher's shop or where fish are caught and dressed, can obtain all necessary flesh feed at a still cheaper rate. They should be careful not to feed too much meat at a time, otherwise it may make the fowls sick or give an unpleasant taste to the eggs. A heaping tablespoonful of meat per day is quite sufficient. This, with a variety of grain and vegetable food, as much as they please to eat during the day, clean, fresh water in abundance, with gravel, old plaster, lime or oyster shells pounded up finely, will insure good health and abundance of eggs, except in the molting season and about a month thereafter. A. B. ALLEN.

OF ALL SEASONS, poultry now require watchful care. Clear up their droppings—whitewash and kerosene the houses—stir up the ground in their yards—cleanse the nests for sitters.

Miscellaneous.

WHAT OTHERS SAY.

BEE ACCOUNT FOR THREE YEARS.—It is asserted that figures don't lie, hence we deem this account more eloquent and persuasive than many an hour-long lecture. Dr. A. J. Wright, of Carlton, Mich. says in the American Bee Journal:—

The following are my profits and losses from bees since 1876:

DR.

Spring, 1876—To 1 colony of bees	$6 00	
" 2 hives @$1.50	3 00	$9 00
CR.		
Fall of 1876—By 3 colonies, @6 00	$18 00	
" 120 lbs. comb honey, @20c.	24 00	42 00
		9 00
Profits		$33 00

[Packed in chaff on summer stands; all wintered well.]

DR.		
Spring, 1877—To 3 colonies, @$6 00	$18 00	
" 7 hives, @1.50	10 50	$28 50
CR.		
Fall of 1877—By 10 colonies	$60 00	
" 175 lbs. comb honey, @15c.	26 25	86 25
		28 50
Profits		$57 75

[Packed in chaff on summer stands; all wintered well.]

Spring, 1878—To 10 colonies, @$6.00	$60 00	
" 14 hives, @$1.50	21 00	$81 00
CR.		
Fall of 1878—By 24 colonies	$144 00	
" 600 lbs. comb honey, @12c.	72 00	$216 00
		81 00
Profits		$135 00

I packed in chaff on the summer stands, and did not lose a colony until after April 6th, 1879; then in three weeks I lost 16 colonies on account of old age of the bees, as the spring was very late. I used the same hives and most of the combs, after cleaning thoroughly. I built up again to 24 colonies, which are in good condition at the present time. I also obtained 400 pounds of comb honey, which at 15c. per pound, amounted to $60, and 200 pounds of extracted honey, which I fed back in September. I purchased 1,000 feet lumber for packing, etc., at $10.00, leaving a profit of $50.00 for 1879.

I use the movable comb hive, and increase by dividing. I began on a small scale, but am going in on a larger one.

LONDON PURPLE.—Prof. C. V. Riley has the following to say in the bulletin of the Entomological Commision: One of the most valuable insecticides that has of late years come into use is that which goes by the name of London Purple. The powder is obtained in the following manner in the manufacture of analine dyes: Crude coal oil is distilled to produce benzole. This is mixed with nitric acid and forms nitrobenzole. Iron filings are then used to produce nascent hydrogen with the excess of nitric acid in the benzole, when distilled analine results. To this add arsenic acid, to give an atom of oxygen, which produces rose analine, and quick-lime is added to absorb the arsenic. The residuum, which is obtained by filtration or settling, is what has been denominated London Purple, the sediment being dried, powdered and finely pulverized. . . Like Paris Green it is not soluble, but is much easier kept suspended in water. If applied in this way some care has to be taken in stirring it in the water, as it has a tendency to form lumps, owing to its finely pulverized condition. . . All that has been said under the head of Paris Green as to the desirability of adding a small quantity of flour, or other substance, to give adhesiveness to the liquid, will hold equally true of London Purple, but the latter has in many respects a great advantage over the former, especially in its greater cheapness, being a mere refuse, which, from its poisonous nature, was a drug to the manufacturers, and had to be gotten rid of by being dumped long distances out at sea. This substance can be put upon the market at bare cost of transportation. It can be sold in New York at the low rate of five cents per pound. . . He recommends the use of one-half pound of this powder to from 50 to 55 gallons of water as the proportion most likely to give general satisfaction by effectually destroying the worms without injuring the plants.

VALUE OF INDIAN CORN.—Within the past few years more than seventy analyses of Indian corn have been made in this country, says Professor Caldwell in the N. Y. Tribune. . . It is plainly shown that while different varieties of common corn do not differ essentially from each other, *sweet corn is decidedly the richest in albuminoids and fat.* If a bushel of sweet corn could be produced as cheaply as one of common corn, it would undoubtedly be profitable to farmers to turn their attention to raising it; but sweet corn as now cultivated is usually the product of a rich garden soil; with the same treatment that other corn usually receives it might grow poorer in quality, at least with respect to the albuminoids. White corn appears to be more variable than other kinds in composition, especially as to the albuminoids, and also to be the poorest of all kinds in this important constituent. Eastern and Western corns are practically alike in feeding value, notwithstanding that the latter, in its air-dried condition, is over two per cent. richer in water. . . Dr. Goessman also analyzed the cobs of three varieties of corn, which, together with six analyses by Professor Johnson in 1878, give the following average results:

Water	8.2	Carbhydrates	57.2
Ash	1.2	Fiber	30.3
Albuminoids	2.7		
Fat	0.4		100.0

This material is poor in albuminoids and fat, but rich in carbhydrates—considerably richer than any kind of cereal straw, while not so very much poorer than such straw in albuminoids; and it is richer than potatoes in respect to both of these constituents; consequently both Stoeckhardt and Wolff were inclined to the opinion that meal from corn-cobs would be as nutritious as the potato, or even more so. Dr. Goessman also takes occasion to speak *a favorable word for corn-and-cob meal*, and some farmers who have used their corn in this way are assured by the results that it is profitable to do so.

THE YEAST FUNGUS.—Dr. Hagan's notion is, that obnoxious insects of all descriptions may be killed by the application of the yeast fungus Every one must have observed unfortunate flies sticking to the window-panes in autumn and invested with a fine tuft of delicate cobweb-like threads. Those threads are the spawn of a fungus, which has caused the death of the fly by its rapid growth. The extremely minute spore, or, as we may popularly term it, seed, is deposited on or in the body of the fly, germinates thereon, feeds on its substance, and speedily kills it. What is asserted positively is that mold (or mildew) introduced into mash, produces fermentation and the formation of a yeast fungus, which kills insects. A Prussian naturalist, Dr. Bail, has, it seems, proved by numerous experiments that healthy insects brought into contact with mash and fed with it, are directly infected, and with fatal consequences. A small drop of blood taken with the point of a needle from the body of a house fly so fed, has been seen under the microscope to be teeming with spores of the fungus. Dr. Hagan proposes to turn this to practical account by using beer mash, or diluted yeast, by means of a syringe or a sprinkler. Plants infested with greenfly, for instance, may be so treated, and the subjugation of the potato beetle is suggested. Beetles sprinkled with it died in about ten days.

TO CRY OUT for protection, says a writer in Mark Lane Express, (Eng.) against the foreigner is simply ridiculous and absurd. The appeal would be drowned by the voice of the country, as it would deserve to be. We do not want protection—we have been "protected," in a certain fashion too long, and it has left us in a poor and dependent condition. We want free trade in land; reform in our land laws; a right to kill the vermin which we have to keep, and which destroys an immense amount of food upon soil for which we have to pay rent, rates, and taxes; and the abolition of old antiquated notions and ideas as to restrictions on cultivation which have hitherto benefited neither the owner nor the occupier. Give us, in short, freedom such as the foreigner has, and we can yet compete with, and even beat, him in the future.

DURABILITY OF TIMBER.—Questions of the durability of timber require care in answering, says the Gardener's Monthly. Almost any timber will last forever, "almost," if kept perfectly dry, or always wet. In all countries are old buildings with all sorts of woods, that have kept their timbers fresh for a thousand years. It is the transition from moist to dry, which encourages fungoid growth that destroys timber. When, therefore, one man tells us that he had a post of some tree which was just as good for — years as the day it was put in, and another finds it rotten in half the time, we see how both statements may be perfectly true. There are some timbers that will resist these alternations of circumstances better than others, and this is what most people are after.

CO-OPERATING DAIRYMEN.—Mr. O. S. Bliss says he can show by figures that it costs more to equip an establishment for hauling milk a mile than to work it at the farm; that it costs more to do the labor, if the team work is counted; that the same milk will make more and better butter if set when first drawn from the cow than after it has been hauled and partially cooled. To all this must be superadded the cost of running the co-operative establishment, the waste of material and the carrying back to the farm of the refuse, often much impaired in value.

CATALOGUES, ETC., RECEIVED.

DREER'S Garden Calendar for 1880.—714 Chestnut St., Philadelphia. This work of 130 pages, is designed to furnish brief directions for the management of the vegetable and flower garden; well illustrated and containing lists of flower and grass seeds—bulbs, plants, small fruits, etc. A gorgeous double-page, colored plate of seedling Coleus raised by Mr. Dreer, many of which are remarkably odd and beautiful, forms a part of the Catalogue. Among many novelties we notice the Telephone Pea, now for the first time offered in this country, though only in very small quantities, at a high price. Our lady readers can not fail to admire Mr Dreer's new strains of the Coleus.

H. J. BAKER & BRO., 215 Pearl St., New York. Circular of Forrester's Complete Manures prepared expressly for each crop. This gives analyses by Prof. S. W. Johnson, of Forrester's Chemical Fertilizers, and sets forth the advantages of their use. As aiding farmers to become familiar with their use, we hope our readers will send for this and all such circulars.

Scientific and Useful.

DR. ANGUS SMITH ON THE WASTE OF AMMONIA IN COKE-MAKING.

PROFESSOR F. H. STORER.

IN the lack of anthracite, which meets so many of our requirements here in America, vast quantities of coke are prepared all over Europe by distilling bituminous coal in special furnaces, from which great quantities of ammonia, tar, and illuminating-gas are suffered to go to waste.

Numerous schemes have been suggested, at one time and another, for saving, a part, at least, of these products: and the question of the ammonia, in particular, has long had a special interest for European farmers. That it is a subject of profound importance to them will be seen from the following computations made by Dr. Angus Smith, of Manchester, and published in a report made by him to the English government, which has just been issued

Taking 1876 as the latest year of which he had definite information upon the subject, he finds that fifteen million tons of coal were distilled in that year in England for the coke used in the iron manufacture alone. But from each ton of the coal five pounds of ammonia, or 20 pounds of sulphate of ammonia, might have been saved by using a certain Belgian method of coke-making, which he describes. That is to say, 130,000 long tons of the sulphate, worth at the current English rate £18 (or $90) the ton, or, altogether, eleven and a half million dollars per year, might be collected. Assuming the tar to be worth half as much as the ammonia-salt, the total product saved by using the Belgian system might be sold for $17,500,000.

In answer to the question what could be done with so large a mass of fertilizing material, Dr. Smith turns to the results obtained by Messrs. Lawes & Gilbert by years of carefully conducted experiments upon the farm, whence it appears that the 130,000 tons of sulphate of ammonia, used at the rate of 223 pounds to the acre, in conjunction with suitable quantities of superphosphate or other mineral fertilizer, would be enough to dress 1,300,000 acres of naturally strong land; and that some such increase of crops, and of money profit, as is given in the following table of Lawes & Gilbert might justly be expected.

Kinds of crops.	Crops from mineral manures alone.	Crops from mixed mineral manures and ammonium salt.	Increase per acre due to the ammonium salt.	Value of increase, in £ sterling, calculated upon 130,000 tons of ammonia.
Barley, at 35 sh. per quarter.	24 bu.	45.75 bu.	21.75 bu.	6,204,030
Barley, at 24 sh. per quarter.				4,254,194
Barley straw, at 3 sh. per cwt.	12.12 cwt	25 cwt	13.88 cwt	2,714,860
Wheat, at 45 sh. per quarter.	15.62 bu.	24.5 bu.	8.88 bu	3,256,659
Wheat, at 36 sh.				2,605,337
Wheat straw, at 3 sh. per cwt.	15.62 cwt	22.62 cwt	9 cwt	1,760,356
Oats, at 3 sh. 4d. per bushel.	17.75 bu.	45.37 bu.	27.62 bu.	6,001,552
Oat straw, at 3 sh. per cwt.	8.25 cwt	22.5 cwt	14.25 cwt	2,787,23

As matters actually stand, the price of sulphate of ammonia is a good deal influenced by that of nitrate of soda, brought from Peru; and the price of the nitrate depends in its turn, in some measure upon that of the ammonium salt. According to Mr. Lawes, the price of sulphate of ammonia is kept up by the German demand for sugar-beet cultivation. He urges that if a very large production of sulphate of ammonia took place, there can be no doubt that nitrate of soda would fall in price. He thinks, however, that an annual production of 100,000 tons of sulphate of ammonia could be sold without any serious reduction in price.

As Dr. Smith remarks, nothing could show more clearly that sulphate of ammonia is much needed in agriculture than this belief of a thoroughly well-informed man that so large a quantity could be thrown upon the market without seriously altering the price. He suggests that it would be a great advantage to agriculture if the amount made were many times greater, so that the price might be reduced

It is plain from the foregoing, that if the manufacture of coke in England were conducted as carefully as is asserted to be economically possible by the Belgians, the manufacturers would gain a great increase of profit, and the land might be made to yield an increase of crops equal to some forty millions of dollars.

Dr. Smith suggests, furthermore, that means may be discovered some day of cheaply converting the ammonia to a nitrate in which form still more advantage may be derived from it as a fertilizer; or even that the nitrogen of the air and the hydrogen of water may be made to combine, so that the available supply of ammonia may be immeasurably increased. But for either of these results special invention is required.

With an unlimited supply of ammonia, such as the invention last suggested would make possible, so enormous an increase of crops might be obtained that American produce would no longer need to be imported into England.

Arboricultural.

BIRCHES.

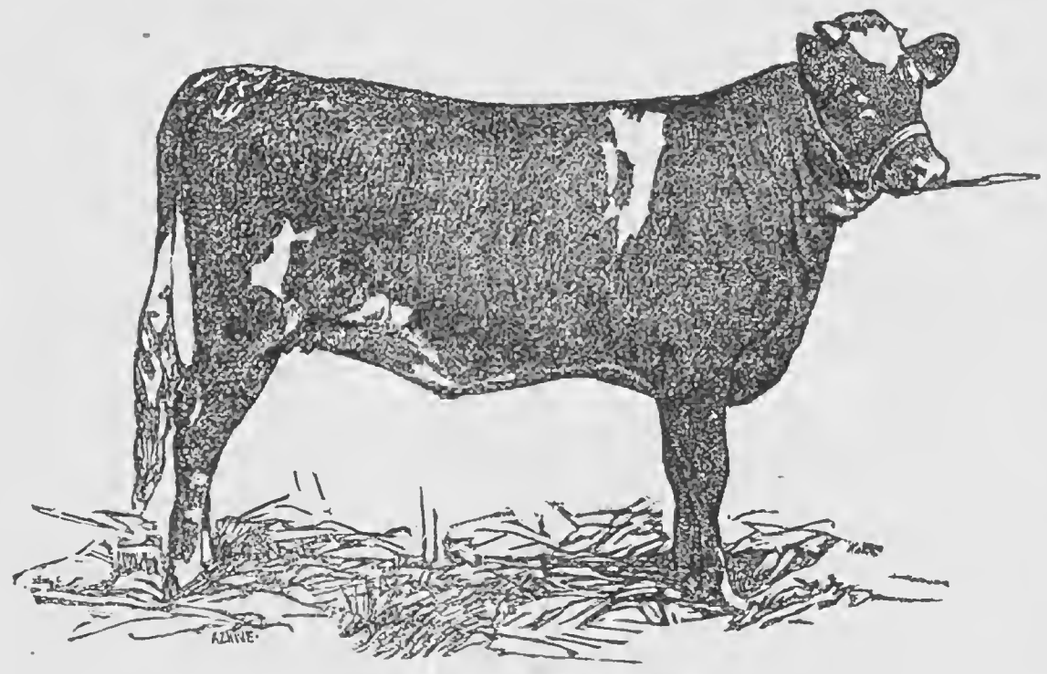
SAMUEL PARSONS JR.

COLERIDGE calls the Birch "the Lady of the Woods." The image seems indeed very apt when we contemplate the refinement of the Birch, its grace and lithesness, its varying moods and altogether delicate appearance. The wood is light and not always easily transplanted; that is, it needs to be treated with discretion and not planted late in the spring. Some trees, like the Poplar, Maple and Willow, will stand almost any amount of ill-timed planting and come out remarkably well; but the Birch, though amenable to good management, has its manners and habits which must not be slighted.

As a lawn tree it is in truth a fair lady, ornamental at all times. In early spring, the bright green satiny leaves unfold in dainty fashion. Later on the tender gray-green foliage delicately sifts sunlight and shadow, giving, in white Birches at least, sundry glimpses of staring, chalky-looking bark of striking character. In fall, the leaves of the same trees turn yellow, at times a beautiful yellow, and in winter delicate tracery of twigs and branches combine with strange-looking, white trunks to make a truly remarkable picture. Did you ever see a large Birch, particularly a weeping white Birch laden with icicles shining in the sun? If you have seen such a tree you will readily agree that it is one of the sights of winter to remember. Most Birches become eventually tall trees, although while young they do not always grow specially fast. Their comparatively slow growth, while young, and great beauty, entitle them to an isolated position on any lawn. The Birch may be planted effectively near a group of trees of broader contour and heavier foliage, or adjoining some arbor, bridge or bit of rustic contrivance. Masses or irregular rows may be properly formed of the commoner sorts along the edges of pools or streams, but ordinarily the tree is worthy of more distinguished treatment than employment in mass. On the whole, the spring is the best time to plant the Birch—early in the spring. Pruning greatly helps it, just as pruning helps all trees that have a tendency to weep. Its value is especially great in this case, because, if not pruned often in the young wood for some years, the Birch loses its lower branches, becomes top-heavy with overhanging boughs, and even sometimes falls in consequence to the ground. To give any idea of the various and numerous kinds of Birches, would require the description of half a hundred trees and shrubs.

Mainly we must have to do on the lawn with the European White Birch and its varieties. There are noble varieties in America, and kindred and equally beautiful kinds in India and different parts of Asia, but the Birch for lawns is essentially the European White Birch. It has in fullest perfection the "sparkling white bark and streaming branches arching like a fountain shower" so admired by every one for ages. This excellence, therefore, gives the European White Birch a first claim on our attention. The variableness of the appearance of different specimens, even where they are not distinct varieties, makes, perhaps, a prominent characteristic. Everywhere, in fact, we see specially weeping forms which, if they were only permanent, would preclude the necessity of grafting pendulous sports for the sake of perpetuity. The finest of the weeping varieties retained by grafting, is Young's Weeping Birch. Vigorous, down-sweeping curves of the most persistent, decided nature characterize its branches and the foliage is of fair size, vigorous and thrifty. Betula alba pendula elegans, the Elegant Weeping Birch, of French origin, is very pretty and graceful, but less thrifty and vigorous. The European Birch takes on, moreover, distinctly and finely cut-leaved forms, and combines this peculiarity with the weeping form in a quite unusual way.

All through the north of Europe, far up into Lapland, we find dwarf European Birches shrubby, small-leaved, and well suited to the lawn. In both America and Europe we have Betula nana, a very dwarf Birch, seldom over



LADY WILDEYES, 15TH.—FIG. 56.

three feet high, and bearing numerous leaves, little, round, smooth and sharply crenulated. The veins are beautifully outlined, especially on the under side of the leaf.

In speaking thus highly of the European White Birch, I don't wish to underrate the excellence of other Birches. American varieties, for instance, are very beautiful. There are, first the brown or yellowish-grey Birches. Less like our ordinary conception of Birches, they are yet lovely trees after their special manner.

Betula lenta, the Pliant Birch, otherwise called the Sweet, Black or Cherry Birch, does not look unlike a cherry tree on a casual glance. It grows large and prefers moist ground like many of its relatives, but also, like most of its relatives, adopts itself readily to most soils, even the most sterile. The leaves put forth early and are downy, and the bronze red twigs are aromatic. Indeed, many Birches after a shower or dew give forth a faint, delicate but delightful odor. Neither should I forget to mention the beautiful yellow "pussies" or catkins that appear on this, as well as many other Birches early in spring.

Betula lutea, the yellow or gray Birch, has a trunk yellowish gray, almost silvery in hue, with leaves more downy and less heart-shaped than the last.

Of the white-trunked Birches of America, there are two noteworthy species: Betula alba populifolia is decidedly attractive and valuable on the lawn. It is a moderate-sized tree, bearing triangular, taper-pointed, smooth and glossy leaves. The Canoe Birch (Betula papyrifera) is perhaps the most noteworthy American Birch. It makes a large tree with quite ovate or heart-shaped leaves. These leaves are dark-green, which makes a strong contrast with the distinctly white older portions of the trunk. The bark peels readily in ample sheets, whence its use for canoe building. B. alba populifolia peels readily also, but not in such masses as the larger papyracea. B. Bhojpattia, called the Indian Paper Birch, is a beautiful Indian species, not unlike our papyracea. B. acuminata of Nepaul is another Asian species, with very taper-pointed, smooth leaves and beautiful, pendulous, oval shape. These Asian species generally are very like our American Birches. I should have mentioned, perhaps, among the European White Birches, the variety Pubescens, bearing leaves covered with beautiful white hairs, as well as B. a. urticifolia, i. e., nettle-leaved, a deeply-cut, serrated and hairy variety, and a variegated kind of the same with leaves blotched with yellow.

I do not pretend to have mentioned all Birches valuable for the lawn, but only a few of the most distinctive. No lawn is perfect without some of these Birches, and any lawn is graced by their light and airy presence. They look and do specially well along the banks of streams, as already noted, and, as should be noted also, equally well on hill-sides and in nooks of rocks.

The Vineyard.

THE EUMELAN GRAPE.

IT is now nearly a decade since this Grape was given to the public with a flourish of trumpets, and the disseminators are said to have made a fortune out of it, and retired from business. The public were at first greatly disappointed with it, solely because of defects in its reproductive organs, the filament part of the stamen being generally aborted and the pollen insufficient, so that it does not fertilize well, causing the clusters to be emasculated. But fortunately the defects are in part confined to young vines; as they acquire age the pollen increases and the clusters become compact. The variety is therefore gaining in popular favor, the vine being hardy. The fruit is black, and the berries of medium size, high quality and flavor. The grape ripens earlier than the Delaware, the Adirondac and Champion only exceeding it in earliness; it never drops from the cluster, or becomes stale, but improves in flavor until frost, and keeps well for winter use. It belongs to our best botanical class, the Æstivalis, and is probably the earliest good grape of its class. It is more valuable for the table than wine. It succeeds better far North than any other Grape of its class.

If it were not for the inherent defect of emasculated clusters, I should consider it our most valuable native Grape. Even as it is, no collection is complete without it. For the hybridizer and amateur, it is invaluable; used as the pistillate parent, its defects do not appear in its seedlings more than in the case of other varieties with perfect reproductive organs, and in the seedlings its high quality seems refined and improved, not reverting or deteriorating so often as many other varieties, especially those of our Labrusca Grapes. It seems strong, vigorous and healthy under all circumstances, but perhaps it will not endure frost quite as well as some of our Labrusca vines of the Concord type, and neither can do this as well as the Cordifolia Grapes of the Clinton type. The Eumelan suffers little from the depredations of Phylloxera, and seldom suffers from mildew. The clusters were more perfect the past season than ever before, the weather happening to be propitious at blossoming time, and I fancied the pollen was more abundant. D. S. MARVIN.

rious.

BRITISH AGRICULTURAL NOTES.

FEW American farmers realize in any full degree the magnitude of the British agricultural imports. I have just been examining the returns for the year 1879, and have found much of interest to me. Broadly stated, the value of the imports of some leading articles, which are also produced by the farmers of the country, during 1879 was as follows:

Wheat and flour	£40,000,000
Other grains	20,750,000
Animals, meats, lard and tallow	22,000,000
Butter, cheese and eggs	16,500,000
Wool	23,260,000
Seeds	7,000,000
Potatoes	2,700,000

Adding the value of other minor agricultural imports, we have a total of over £140,000,000, and at least $680,000,000 valuation of the agricultural articles imported by Great Britain last year. Of the wheat and flour the United States supplied a little over half. One item which might not attract attention is yet worthy of special notice. The value of the importation of guano in 1879 was a little over £700,000; the imports in 1878 were valued at a little over £1,800,000, or a decrease in one year from nearly $9,000,000 to something less than $3,500,000. I do not recall any one fact which more clearly shows the feeling of depression among the agriculturists of the country than does this.

As a whole, the imports for last year were little larger than those for 1878 or 1877. In some articles there was an increase; in others a decrease.

Another table just at hand has decidedly interested me: that giving the sunshine during the years 1878 and 1879 at Greenwich Observatory. Last year there was bright sunshine 982.8 hours; in 1878 for 1,249.8. The first is less than one-fourth of the possible sunshine for a year. During January and February, 1879, there were but 45.5 hours of sunshine, and but 71.6 hours in November and December. In July last there were but 99.3 hours of sunshine. Both in 1878 and 1879 June had the most sunshine of any month. For the first full week of this year there were but 3.9 hours of sunshine out of a possible 56.

The great falling off in the demand for English farms is well shown by the fact that one number of one English paper contains advertisements of 80 farms, aggregating 17,000 acres, which are to let. In prosperous times it has been the rule to have several applicants for each vacant farm; now there are several farms from which each applicant can choose.

The Mark Lane Express has published reports as to the harvest of 1879 from 453 correspondents, representing every county in England and 10 of the Welsh counties. The reports are the most discouraging ever published. One farm reported an average wheat crop and only two barley crops were above average, with 51 reported as average. Oats were much better, more than half being average or better.

The same number of the English Agricultural Gazette, from which the above notes have been collected, reports recent auction sales of forest trees. Thus in Hampshire 887 trees, of beech, elm, ash, fir, oak, poplar, etc., brought £775. In Gloucestershire 132 trees brought £297; 71 black poplars, £133; 740 beech trees, £600; 90 elm, £184; 144 oak, £755. This last sale of oak was at the rate of about $25 per tree.

I take much interest in such evidences of the condition of agricultural affairs in Great Britain, and it occurred to me this collection of notes on a single number of a weekly agricultural paper might interest RURAL readers.

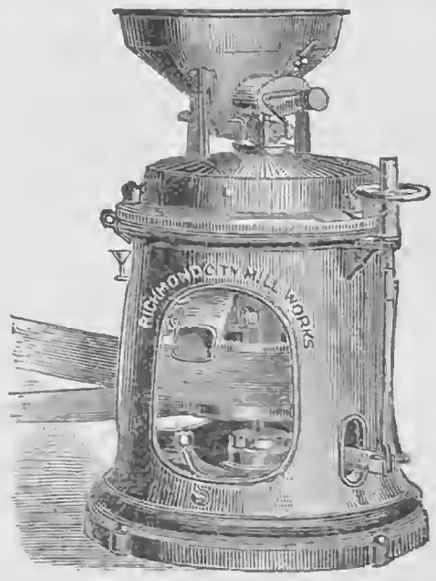
G. E. MORROW.

OUR ANIMAL PORTRAITS.—The accompanying cut represents the yearling heifer, Lady Wildeyes, 15th winner of the 1st prize at Kilburn, when ten months and one week old. The little beauty was then considered almost an ideal Short-horn calf. She is the property of Lord Fitzhardinge, and the daughter of the Duke of Connaught, of the celebrated Bates Dutchess tribe. The Wildeyes tribe, whose blood she largely shares in, dates away back to about 1832 when Mr. Bates bought from Mr. Parrington, of Middleboro' farm, the first of the tribe, then called Wildair, but afterwards christened Wildeyes.

Industrial Implements.

THE "PRIDE OF RICHMOND" MILL.

THIS neat, little 20-inch mill has proved a success where a small mill of from two to six horse power has sufficed. It has a capacity of from 4 to 15 bushels of corn, and from 10 to 25 bushels of feed per hour, depending on the power and number of revolutions. The pulley is 14x7, and the number of revolutions per minute should not be less than 350 and may be as high as 800. The burrs are of best Anchor stock; the husk of iron cast in one piece, turned quite true to receive the bed-stone cap,



which is also turned true and provided with hinges, so that the mill can be opened for examination or dressing the stone. The bed-stone and cap are held in position by bolts passing through rubber springs, which yield when any hard substance passes in with the grain, thus preventing breakage. The spindle is of the best wrought iron, with steel cock-head and toe; the tram pot is adjustable with three tram screws; the runner-stone has improved self-adjusting irons, and before leaving the shop the stone is put into perfect running and standing balance. The mills are made with silent feed or a damsel hopper and shoe, and the delivery spout may be readily changed to either side. We have heard very good accounts of these mills from several quarters. They will be furnished on short notice and all information about them at once by the Richmond City Mill Works, Richmond, Ind.

Everywhere.

RURAL SPECIAL REPORTS.

ILLINOIS, Baileyville, Ogle Co., Feb. 4.—The mild, wet weather in January, followed by hard freezing the last few days of the month, while the ground was bare, injured the winter wheat in this section, but we cannot yet tell how badly it is damaged. The 2nd inst.—"Ground-hog Day"—was fair and, according to the old saying, our G. H. came out of his sub-terranean winter-quarters and seeing his shadow, retired again for six weeks more of winter; and, strange as it may seem, there came a heavy snow storm the next day. Clear and cold to-day, 3 deg. below zero this morning. Business has been dull the past month, but now seems to be reviving. W. E. D.

KANSAS, Parsons, Labette Co, Jan. 31.—Weather is the topic of universal interest, and it is not surprising it is so, when our health and material interests are so much affected by it. Our fall and early winter were fine and dry, and plowing was prosecuted by those who don't have more work than they can do. We plowed last week and this, and are nearly through. Yesterday we had two inches of rain, being the second rain since November, the first rain being nearly three inches. Saving in the spring, we are not apt to have showers. Our rains are singularly regular. We hardly fail to get a rain within a period of a month, and there will be an average of two inches. The interval is too long in July and August, as our winds, heat and the character of the soil evaporate the moisture rapidly. At the end of two weeks after a rain, in those months, crops begin to show a lack of moisture, or, I should say, a lack of food, which the moisture would render available in the soil. Our blue grass is ready to show its color fully as soon as the frosts cease. Wheat is looking well. Our farmers have had a good time in hauling off and selling their corn which was more than an average crop. Prices have been "booming" for this region, all having gone to our southern sister, Texas. Prices have been as high as 32 cts. Wheat here is $1.10; flour, $4 per 100 pounds; potatoes, $1: prairie hay, $4 per ton; eggs, 10 cts. per doz. Did you ever hear of the Texodusters? You have heard of the "exodus," of course. Now you derive from this the "exoduster." So also you have heard of Texas; from this we derive *Texodus*, and thence we derive Texoduster. The Texodus commenced about the first of November, and has been pretty continuous ever since. Till that time there had been no unusual influx of negroes. In fact there had been no movement of them except the usual barbers, boot-blacks, porters, etc. Parsons, being the first important point out of Texas, and the junction of several divergent railroads, it became the chief rendezvous of the exodus. While we would rather not have this immigration, we must make the best disposition of the matter we can. We had in 4 000 people, 200 negroes. Now, in 5 000 we have more than 1,000 negroes. They are laborers, plantation hands, and small farmers. They are intelligent, and well behaved for their class. The Board of Education has prepared a special room for the youth of the exodusters. S. B.

MASS., Winchendon, Worcester Co., Feb. 3.—We had very mild weather here for the last month, but this month has commenced like winter. To day it snows and blows like a hurricane. Beef and pork are selling here for $6 per 100 pounds. Most of the people about here would like to see a couple of months of good sledding. J. S.

MICHIGAN, North Byron, Kent Co., Feb. 5th, 1880.—We are having quite an open winter. No snow during January, but an unusual fall of rain. Farmers were plowing their old meadows last week and the week before. But February has come to us with a clear, cold greeting, with about four inches of snow, which will make a good covering for our wheat, which at present is looking well. Prices are: wheat, $1.20; corn, 45c.; butter, 18c. to 20c.; eggs, 14c. to 16c.; pork, $4.50 to $5 per 100 pounds. W. K. E.

MO., Springfield, Green Co., Feb. 3.—All through January the weather here was very warm, so that farmers kept on plowing all the time. Wheat looks well and more than the usual acreage has been planted. I have about four acres in Raspberries, including all the kinds I could get; but after three years' experience, I have come to the conclusion that for this section the Thwack is best. J. B. L.

N. Y., Elmira, Chemung Co., Feb. 2.—Thus far our winter has been remarkably mild and open. We have not had a week of steady freezing weather, or a day of good sleighing, and owing to a large amount of rain the roads for the most of the time have been bad and the wheeling heavy, especially on those very much traveled. This kind of weather, although unfavorable for teaming has been favorable on some accounts. It has enabled farmers to plow and to do up a large amount of work that will relieve them when the more busy season of spring opens. It has also been very favorable for a large number of farmers hereabouts who were short of fodder and feed for stock. Owing to the severe drought last summer, our farmers gathered a much less quantity of hay than usual, and in consequence the price advanced in Elmira to $15 per ton for hay of good quality; but the mild winter and the economy with which farmers generally used their feed have made a much lighter demand for it than usual, so that there is a considerable falling off in the price of hay. The prospects for the winter wheat crop in this locality are poor indeed. The dry weather last fall allowed it to make but feeble growth at best and some late-sowed crops made no growth above ground at all. This fact in connection with our open winter, with much alternate freezing and thawing, will doubtless leave it in poor condition by spring. I think the yield per acre of winter wheat in this country will fall 50 per cent. below the average. As I have stated in previous communications, the farmers in the Chemung Valley are largely engaged in growing tobacco. It has been estimated that the present crop will yield about 5,500 cases or 2,200,000 pounds. Probably one-half of this has already been bought up, by New York dealers mostly. The prices paid have ranged from 11 to 15c. per pound for running lots. The weather has been very favorable for handling tobacco, and growers are busy assorting their crops and preparing them for market. There is a marked contrast in the present prices of farm produce here and those of a year ago. The prices of the principal products are as follows: Wheat $1 35; corn 63c.; oats 35c. to 40c.; barley 60c. to 70c. per bushel; hay $10 to $13; straw $6 to $8 per ton. G. A. G. JR.

OHIO, Mt. Vernon, Jan. 28.—We are passing through one of the most delightful winters that ever was witnessed in this section. Everything looks well, especially the wheat; never was such a showing as now, and more acreage by one-half is under it. Ice has not formed this month an inch thick. We can cut good spinach and rhubarb from the open ground. Our prices are a shade lower for staple goods:—Potatoes 35 to 40c.; apples, New York State select, $1.25 per bushel. Last season you could leave off the $ mark and then have to crowd the bushel to get the 25 cents' worth. Wheat, $1.25; oats, 35; corn, 50 cents; cabbage $4 per 100; onions, $3.50 per bushel. Last season they were 50 cents and dull at that. Our ice-men's lips are beginning to quiver—they are beginning to think there's no show for them. Our prospects for a fruit crop for next season are good. I have a large peach orchard that is loaded with perfect buds. Is there anything anyone could suggest that will help to keep Hale's Early from rotting so badly? Would it not be a good idea to mulch well with fodder to keep the ground cooler and then thin out freely when about half grown? M. W.

PA., Winterburn, Clearfield Co. Feb. 6.—Winter very open, so far no snow or cold weather of any account, which is very acceptable to the farmers in this community as it will save fodder, which is very scarce—hardly any to be bought at any price. Other products are reasonably plentiful at fair prices. Lumbering forms one of the chief pursuits here; so far the winter is very discouraging to many engaged in this industry, as they depend on snow to haul their logs and timber to the streams. H. F. S.

TENN., Waverly, Humboldt Co, Feb. 5.—This has been the warmest winter to the 1st of Feb. that we have known for many years. Now winter seems to have set in, snow fell here on the 2d., 14 inches deep. S. E. S.

VA., Fredericksburgh, Spottsylvania Co., Feb. 3.—We have had a very mild winter so far; no ice harvest yet, and a very poor prospect for any. There was just a fair average of ground sown in wheat last fall, which at this time is looking very well indeed—rather better than it generally does at this time of the year. The prices of grain and farm products have had a fall here as well as elsewhere. Choice red wheat is now worth $1.47 per bushel; new corn, from 55@57 cts.; rye, 80@85 cts.; oats, 40@42 cts.; apples, $1 per bushel. Wheat has yet a downward tendency. The farmers through this section make as much money from dressed hogshead hoop poles as from any thing else; in fact it is the main business from early fa to late spring. F. M.

VERMONT, Newport, Orleans Co., Feb. 6.—I see you call Honey Locust "iron-clad." It will not stand a single winter here without being cut down to the snow line. The only hardy deciduous hedge plant we have is Buckthorn. Have had a very open winter. No snow on the ground to-day, and a warm south wind with bright sun. Plowing has continued at intervals all winter, and winter rye has been sown this month—an almost unprecedented event in Vermont. Expect to "catch it" later on, T. H. H

The Querist.

ANSWERS TO CORRESPONDENTS.

Raising Early Potatoes in Boxes.

W. S. T., Cornwall, Ont., asks if potatoes can be started in boxes in the house so as to have early potatoes, if so, please describe the best plan.

ANS.—Yes, potatoes can be grown in boxes for early use. Procure boxes three feet long, one foot wide and ten inches deep; bore half-a-dozen holes in the bottom of each to give outlet to the surplus water. Put in about six inches of rich garden loam, and plant in each box five potatoes of some early variety. The boxes should then be put in a warm place and the soil kept moist. As soon as the sprouts appear above ground, they should have as much light and air as possible and still be kept warm. A hot-bed, with a gentle under heat, will then be the best place to set the boxes, as the sashes can be removed on mild days. A greenhouse will do very well, but the plants can hardly get there all the fresh air they need. When the tops are about six inches high, put in two more inches of soil, and, two weeks later, entirely fill the boxes. By this management new potatoes can be had in the beginning of May. Of course, one who has not the use of a hot-bed or a greenhouse, can place the boxes under the windows in a warm, sunny room, and on mild days place them under a wall on the sunny side of a building; but this would entail more labor, and the results would not be quite so satisfactory.

About Cow-peas.

P. C. S., Hurlocks, Ind., asks whether it would be well to sow Cow-peas about March 20, and turn them under to fertilize for sweet potatoes, say about May 20, or about two months after sowing them; 2, about how high would they grow in that length of time; 3, how much seed for an acre; 4, he sends specimens of what is there called Black-eyed peas and inquires whether they are like Cow-peas.

ANS.—1, There would not be enough vines in so short a period of growth to enrich the ground profitably. 2, Probably one foot in your climate—but the different kinds vary in earliness and hight. 3. We should sow one bushel to the acre in drills four feet apart. 4. "Black-eye" is one kind of Cow pea which is a generic name comprising many varieties and *perhaps* several species.

Sowing Blue Grass.

H. H. M., Troy, Mo., asks how many pounds of blue grass it takes to sow an acre, and whether it is best to sow it by itself or with oats.

ANS.—Blue grass should not be sown alone, as it grows very slowly and will be three years before it makes much show. Twenty pounds per acre or 1½ bushel may be sown with timothy, orchard grass and clover; (6 lbs., 20 lbs. and 8 lbs., respectively) and when these begin to fail, the blue grass will appear and occupy the ground. It is obvious that a grass of this kind should not be sown alone, but if mixed with the above varieties, they would be well sown without any crop as early in spring as possible.

Peaches in Succession.

J. T., Olive Bridge, N. Y., asks for a list of early, medium and late peaches.

ANS.—As the three best varieties for a succession of fruit for your section, we would name Mountain Rose for early; Oldmixon Free for medium, and Crawford's Late for late. Alexander's Early, Hale's Early, and others of the same class are earlier than Mountain Rose; but are not reliable in your section owing to the rotting badly of the fruit on the tree and so soon as gathered. The best *very* late sorts are Beers's Smock and Salway. These are so late, however, that they fail occasionally to mature their fruit so far north.

"Tawing" Sheep Skins.

L. H., Steubenville, O., asks how to "taw" sheep skins, as mentioned in a late Rural.

ANS.—Tawing is done by scraping the flesh side of the pelt clean from all flesh or fat, then sprinkling it with a mixture of finely powdered alum and salt in equal parts. Two skins are then laid with the flesh sides together, or a single one doubled lengthwise, and rolled up for a week or ten days; then opened, scraped and washed, and rubbed dry with a piece of chalk, and worked and pulled until the skin is soft.

Miscellaneous.

L., Springle, Suffolk Co., N. Y., asks what manures we used to produce the yield of oats described under Notes from the Rural Farm; the previous treatment of land etc.

ANS.—The crop taken off in 1878 was corn. Mapes's "Corn Manure" was used in hill only. Previously for five years, the field (nearly five acres) was in grass. Last year it was sowed to oats and an "oat fertilizer" purchased of H. J. Baker and Brother (215 Pearl St. New York), was sown at the rate of 400 pounds to the acre. The season was favorable to the crop and the yield was nearly 70 bushels to the acre. The oat fertilizers, Mr. Baker informs us, is known as "Forrester's Oat Manure." The soil of the above field is a sandy (somewhat gravelly) loam. We credit the fertilzer with the large results obtained, though having made no comparative tests, we cannot state to what extent the large yield was due to its use. Mr. Baker, upon application, will furnish descriptive price lists and any desired information. We trust that our farmer readers will accept the RURAL'S advice so often given, viz., to try different kinds of concentrated manures on small plots, with adjoining plots cultivated to the same crop without manure, so that the effect of the fertilizers may be shown. We should state that we deemed the above field not well adapted to oats or, indeed, to any other crop, having received no manure for ten years, except as noted above.

A. C., Liberty Falls, N. Y., asks 1, if there is anything known that will prevent peas getting weevil-eaten.

ANS.—No adequate remedy is known. Since the insects are confined in barrels or bags with the peas until spring, they may be killed by immersing the bags, peas, bugs and all, in warm water for a few hours before planting; thus by exterminating the old insects there would be no progeny. This, of course, would still be a useless task, unless everybody in a whole district would take the same precaution.

R. B. M., Mountain View, Ont., asks 1, which is the best way to build stone under-drains—to lay the stones or tumble them in? 2. Do we take Canadian postage stamps for fractions of a dollar when subscribers cannot procure American ones?

ANS.—1. Lay the stones in the bottom of the drain, and take care to arrange them so as to leave an open water course; for the upper portion they can be tumbled in. 2. We prefer not to take Canadian stamps.

H. B., Greenville, S. C., asks, 1, where we think he can get the most reliable improved seed corn; 2, where can he get fine pure seed of the peanut that has three or four peas in a shell and the price.

ANS.—1. Send for catalogues recently noticed and make selections therefrom. 2 Visit the markets and select peanuts that have three and four seeds. For price see market reports.

M. Y., Cincinnati, O., asks for the exact proportions of the mixture for preventing mice from injuring fruit trees, as given in RURAL of Dec. 20.

ANS.—First put enough quick lime in a pail to make a pailful of ordinary whitewash. Then add a gill each of sulphur, hellebore, whale-oil or soft-soap, and enough of lamp-black and red mineral paint to give the desired coloring in imitation of the color of the bark of the trees to be washed. Fill the pail three-quarters full of boiling water. Stir frequently while using.

L. R. T., Charleton, Saratoga Co. N. Y., asks where can he get Cow-peas.

ANS.—See advertising columns.

B. B., Portageville, Wyoming Co., N. Y., asks how to tan coon skins, leaving the fur on. Who can tell him?

H. E. P., Loganville Pa., asks many questions respecting the culture of Roses, all of which are fully answered in the Rose Guide published by the Dingee and Conard Co., of West Grove, Chester Co., Pa., noticed under Catalogues etc., Rec'd.

G. E. P., Toledo, O., asks for information about the Duchesse de Bordeaux pear for market.

ANS.—It has not been extensively planted. It is a winter pear, sweet and of fair quality. Tree a vigorous grower.

J. C., Monmouth Co., N. J., asks when to sow green peas to insure the earliest crop.

ANS.—The latter part of this month, if the ground can be worked. The wrinkled sorts are more tender than the smooth early sorts.

H. F. S., Shelburne, Vt, asks if Benson, Maule & Co. of 223 Church St., Phila., are a responsible firm to deal with.

ANS.—They are considered responsible and reliable parties.

F. H. S., Baden, Pa., asks if Cricket on the Hearth is published now, and if so, where.

ANS.—The above paper is published at 245 Broadway.

G. K., Greensboro, N. C., asks where can Egyptian, or Rice Corn and Doura be obtained.

ANS.—See our advertising columns for several weeks past.

TO INQUIRERS.—We are constantly in receipt of inquiries about the prices of seeds, tools, etc., and where they can be had. etc., etc, all of which are answered either in our advertising columns, under Catalogues Received, or in our market reports. We have a large number of queries of this kind now on hand, and for answers we hereby refer our friends to the above store-houses of valuable information.

Miscellaneous.

PROF. C. V. RILEY'S REPLY.

TO THE EDITOR OF THE RURAL NEW YORKER:

Dear Sir:—In your issue for Jan. 31st, you seek to defend the charges to which I took exception, by a long letter from the present Commissioner of Agriculture. You are kind enough to ask suspension of judgment till I am again heard from, and to hope that any further controversy may prove "short, pertinent, and decisive." More lies are easily crowded into one line than can be refuted in a hundred; but, so far as a reply to nearly four columns of what is largely misrepresentation can be made short, I will endeavor to make it so. Your first and second statements, the truth of which I denied, are comparatively unimportant; nor do I see that you have proved the first, or that I sought the position in any way beyond that which I mentioned. In reply to my second denial, you state that you received a letter from me asking you to pronounce upon my fitness, and so on. I beg you to produce that letter in proof, as I have no recollection of it.

[The letter itself has not been preserved. The following affidavits are offered in proof that it was received:

This is to certify that a letter, signed C. V. Riley, and directed to the Editor of the "Rural New-Yorker," was received a few weeks prior to his appointment as Entomologist to the Department of Agriculture. The purport of the letter was as follows: "My name has been mentioned in connection with the position of Entomologist to the Department of Agriculture, made vacant by the illness of Prof. Glover. Would you kindly state whether, or not, you deem me qualified to fill that position?"

Signed {E. S. CARMAN, Editor "Rural New-Yorker."
{W. L. HERBERT, Assistant Editor.]

THE STATE, CITY AND COUNTY } ss.
OF NEW-YORK. }

The foregoing writing was subscribed and sworn to before me this 9th February, 1880.

J. B. NONES, Notary Public,
91 Duane S.t, New-York.

The letters of recommendation in my behalf, which are in Gen. Le Duc's possession, will show (if he care to produce them) the character of the writers, and prove the truth of my statement that I sought principally the opinion of leading naturalists, particularly entomologists. That I included a few editors of agricultural journals to which I had been in the habit of contributing, and requested them to send their opinion to the Commissioner, or to me, is most probable; but the expressions of the press, as such, were spontaneous, and not asked for.

The burden of your defense rests with the fourth statement: viz., that I exerted my best influence to get back to the Department, after having resigned. In support of this charge you depend on the evidence of Gen. Le Duc, at once indicating by whom the charge was prompted.

I am aware how difficult it is for me to prove the utter falsity of conversations purporting to be reported. Fortunately, however, in this case, evidence of fabrication is frequently apparent; for no one who knows me will believe that I have given utterance to the language imputed to me in many instances. For the rest, I must depend on the testimony of others. Not to claim too much of your valuable space, I can best state the truth by reciting, as briefly as possible, the facts that in any way bear upon my resignation and upon the point in dispute, and by referring, as I proceed, to the evidence, duly enumerated, which I send for your own satisfaction, but which I hope you will make room for at the end of this communication, even if you have to print it in solid agate or diamond.

I accepted the position of Entomologist to the Department with a full determination to endeavor to accomplish practical good. With this view, one of my first efforts was to secure, with the Commissioner's aid, an appropriation for the Entomological Division, of $5,000, by the passage of the following clause, taken from the legislative bill, and penned by myself:

"For investigating the history and habits of insects injurious to agriculture; for experiments in ascertaining the best means of destroying them; for chemicals, traveling, and other expenses *in the practical work of the entomological division*.....$5000.00."

I also successfully used my efforts to have another special appropriation of $5000.00, for the investigation of insects affecting the cotton plant, diverted to the Department. Senator Morgan, of Alabama, who drafted the bill, and who originally wanted a separate commission, will testify to the fact.

I deposited in the Department my entomological library and collection, and began to introduce various needed reforms. For a while everything went on most agreeably, but finally I had some difficulty in getting the Commissioner to heed, and, more particularly, to carry out, sundry propositions; and I gradually came so to deplore his abrupt and overbearing manner that I twice expressed to him my belief that I was not the kind of man he wanted, and had, perhaps, better retire. I remained upon assurances to the contrary, and upon finding that my own experience was not exceptional. As Entomologist of the Department I naturally felt interested in, and largely responsible for, the results to flow from the expenditure of the special appropriations above alluded to, and which had never before been made to the Department; and, finding that they were being used for other general expenses of the division, which had in previous years been met by appropriations to the Department, I felt obliged to remonstrate against such diversion. On one occasion, in order to avoid such diversion in the future, I urged the Commissioner to have the regular employees of the division specifically provided for in the regular estimates. [In the present year's estimates these appropriations are asked for in the exact form in which I urged them, thus proving the force and necessity of my suggestion.] He remarked: "Prof. Riley, I feel myself abundantly able to run this Department. When I want you to do so I will let you know."

[C] Both the manner and the language of his reply were so offensive, that I immediately wrote my letter of resignation. Wishing to present it in person I went two or three times to the Commissioner's room, but found him, each time, occupied with visitors. I then asked Mr. Carman, the Chief Clerk, to take it in, explaining to him its purport. He expressed regret at my action, and begged me to reconsider it. I replied that my course had been well considered, narrated the facts as just set forth, and finally told him that I would reserve the letter of resignation till the following morning, so as to give him an opportunity of ascertaining whether the Commissioner meant his language to be offensive. Upon being informed by Mr. Carman, next day, that the Commissioner had vouchsafed no explanation, I tendered the letter of resignation. A few hours later, Mr. Carman came to my room and stated that my resignation had been accepted, but that the Commissioner desired me to remain until the 1st of July. I declined to do so, remarking that I did not care to remain beyond the time necessary to get matters in shape for my successor. At the same time I asked him what was the cause of the Commissioner's offensive manner, and was informed that he (the Commissioner) charged me with the interference in the matter of legislation presently referred to. This was not "some days later" as Mr. Carman states in his card," but the very day of my resignation, which was Saturday; for it was on the following day (I was in the habit of spending Sunday morning at the Department, and generally found Mr. Carman and the Commissioner there), that I went to the Commissioner; stated what Mr. Carman had told me; denied having had anything to do with the matter with which I was charged, and told him that for my own satisfaction and vindication I would endeavor to ascertain the facts. From that time on I never gave Mr. Carman, either by word or act, the first reason for supposing that I wished to be reinstated, and it is evident from the latter part of his card that he has confounded with such wish my expressed determination to give the Commissioner proof of his error, and that in other particulars his memory has played him false. [The foregoing statement from the C in brackets, has been shown to Mr. Carman. See evidence marked C.] That some of the statements which I am reported to have made in conversation with the Commissioner, may be understood, it is necessary to premise that in accepting the position of Entomologist to the Department, in the spring of 1878, I nominally retained the chieftainship of the U. S. Entomological Commission, with which I had been honored, but renounced the salary and active charge. For reasons best known to himself, and entirely without the knowledge or request of any member of the Commission, the chairman of the House Committee on Appropriations, (Mr. Atkins), had caused the words "and the cotton worm" to be added to the clause in the Sundry Civil Bill appropriating for the work of the Commission on the Rocky Mountain locust. This seemed like a reflection on the Department, which was then carrying on the cotton-worm investigation under my direction. Commissioner Le Duc, on the Sunday alluded to, confessed that his previous offensive manner was due to the belief that those quoted words were inserted at my instance, but superadded insult by hesitating to accept my word to the contrary. He even repudiated the evidence in the following letter, subsequently obtained for my own satisfaction.

COMMITTEE ON APPROPRIATIONS,
HOUSE OF REPRESENTATIVES,
WASHINGTON, D. C., APRIL 1, 1879.

PROFESSOR C. V. RILEY, *Dear Sir*:—Your letter of the 3rd. inst is at hand. The words "and the cotton worm" to which you refer in your letter as being contained in the Sundry Civil Bill, were inserted at my instance, and upon my responsibility alone, without suggestions from you or from any one else, Respectfully,

L. D. C. ATKINS.

It is true that when I learned the cause of the Commissioner's irritation I took pains to prove that he had wronged me; and for this purpose wrote to the only persons who would be likely to know the facts and my course in the matter, expressly stating that I did so for my own satisfaction, and not with a view of remaining in the Department. These persons were the Hon. Mr. Atkins, whose letter is above reproduced; Senators A. S. Paddock and Wm. Windom, who were at the time chairmen respectively of the Committees on Agriculture and Appropriations in the Senate; and Professor Thomas and Dr. Packard, my co-laborers on the Entomological Commission. [See letter marked A. They were all of the same purport except that those to the Senators also called attention to previous letters, in which I had endeavored to have the offending words stricken out.] The replies of the two last named gentlemen were addressed direct to the Commissioner, and I have not seen them. If they expressed any hope that the difficulty would be adjusted or that I should remain, it was, (as in the case of Senator Paddock), without request of mine, as they will testify. The other letters were addressed to me and submitted by me to the Commissioner [see letter marked P, that from Senator Windom being to the same effect.] [A few days after the above mentioned occurrence, the Washington papers and others, announced that I had resigned on account of ill-health, and was going West to recuperate—the presumption being that the information emanated from the Department. This obliged me to give the facts, which I did in the following card dated April 3. Slip A.

[To the Editor of the Post:]

Sir; It has been announced in your columns and elsewhere, that I have resigned my position as Entomologist of the Department of Agriculture on account of ill-health, etc. Those who originated such a report must have had some other end in view than truth, and I cannot have such a report wired over the country, to excite unnecessary anxiety among friends, without correcting it. My health was never better, and the real cause of my resignation may be gathered from the following letter tendering it: [Letter already published in the Commissioner's communication.]

It is to be regretted—but not on my own account—that the public and private expressions about the matter were not more gratifying to the Commissioner.

Regarding the Baltimore Gazette paragraph to which the Commissioner devoted a column and a half, I cannot see what it has to do with the question in hand; for if it proves anything it confirms my statements, since I should certainly not have taken that mode of conciliating the Commissioner, had I desired reinstatement. The report is, however, sufficiently erroneous to have done me more harm than it did General Le Duc, and the following letter will throw some light and truth thereon.

DEPARTMENT OF AGRICULTURE.)
ENTOMOLOGICAL DIVISION, APRIL 17, 1879.{

Sir:—Your favor of the 16th, inclosing a paragraph from the Baltimore Gazette and requesting my avowal, denial or explanation of certain charges against you, with which my name is therein coupled has been handed to me.

I have already given you orally, in a general way, the facts in connection with said paragraph, so far as I have any knowledge of them, but am glad of the opportunity of doing so formally and specifically, especially since I have been further misrepresented by the Editor of the Sunday Republic, who, at your instance as he avowed, called on me last week to get the facts in relation to another paragraph in the Louisville Courier-Journal, based upon the Gazette item, but containing sundry additions. I stated to him the facts in the case, as they are given below; yet, in the last issue of his paper he puts words in my mouth which I never uttered, and, by a reckless disregard for the truth, places himself in the same category with those whom he justly condemns.

The reporter of the Baltimore Gazette introduced himself as such, at my residence, soon after my resignation, with the avowed purpose of learning more as to the cause of said resignation. A stranger to me, I informed him that the reasons were given in my published letter tendering it; that it was purely a personal matter; that in offering some suggestions for the benefit of my Division, you had treated me with what I considered insulting manner and language, that you had wrongly charged me with having been instrumental in getting the words "and the cotton worm," added to the clause in the Sundry Civil Bill appropriation for the United States Entomological Commission; that you hesitated to accept my word to the contrary; and, finally, that full and satisfactory proof of my veracity and of your error had been furnished by men familiar with the facts.

The reporter then cited various charges that have been and are being made against you. I informed him, in reply, that my resignation had nothing to do with them, except so far as I might have incurred your displeasure by having remonstrated against the diversion of the special appropriations for the investigation of injurious insects to the payment of the clerks and draftsman employed in the Entomological Division.

I deny having said anything about the cotton worm fund being so drawn upon that I could not operate with success, or about a draftsman being sent to Minnesota to make plans for a new house for you.

The loose paragraphs about my resignation which have misrepresented me, from being colored by some underlying person al motive on the part of the writers thereof, have been extremely annoying to me, as I would gladly avoid this kind of notoriety.

Of your conduct, which induced my resignation, I have just cause for complaint; but it was totally foreign to the gossip afloat about the Department management, of which I have heard enough since my resignation to make me trebly satisfied with the course I have taken.

Your letter, with inclosed slip, is returned herewith, as requested. Respectfully,

C. V. RILEY, *Entomologist*.
W. G. LE DUC, *Commissioner of Agriculture*.

The above letter gives the truth about the interview, and it states only what I had previously stated to the Commissioner by word of mouth. Mr. Butler took no notes during the interview, and he drew on his imagination or on other sources of information in so far as his report departs from my statements. I pronounce the reputed stenographic report of my verbal remarks in the main erroneous and misleading, while the interview had with me by Mr. Brisbin Walker was, from the subsequent untruthful report of it, so evidently contrived for a purpose, that it is hardly necessary to add in confirmation of that interpretation of it that, as I have good reason for believing, Mr. Walker was at the time receiving $100 per month for his services in preparing and editing items intended to popularize and laud the Department and the Commissioner; and that he has since been sent to Colorado as an agent of the Department to "investigate mineral lands." He would be an idiot indeed who, after acknowledging and explaining the interview, should deny its having taken place! The following letter was addressed to Mr. Walker but never published.

[Letter to the Editor of the Republic, April 14, 1879]

I had thought that the letter tendering my resignation of the position of Entomologist to the Department of Agriculture, which I found it necessary to make public in order to correct an erroneous announcement regarding my health, was a sufficient explanation of my conduct. The reputed conversation with me to which you refer as contained in the Louisville Courier Journal, couples my name in an unwarranted manner with the charges against Commissioner Le Duc which have lately been bruited about; and I so informed you when you called upon me. But I also informed you of the facts in regard to the origin of the paragraph in question, and neither uttered the words which you put into my mouth nor gave expression to anything that would warrant such a quotation. On the contrary I told you that the paragraph was made up, with additions, from a report that first appeared in the Baltimore Gazette and that this last was based upon an interview with me by a reporter of that paper who introduced himself at my residence and who managed to misrepresent my statements almost as thoroughly as you have done.

Regarding the so-called reports of my conversations on the 29th of April, they are so incomplete, garbled and misleading that they show one of two things: either, first, that Mr. La Dow (the stenographer whose occupation is to be ever near the Commissioner to take down conversation) is a most indifferent reporter and the Commissioner's mind and memory very faulty: or, second, that the one is a tool of the other in willful misrepresentation. I have a vivid recollection of the whole conversation, and herewith give the facts with the evidence in confirmation, so far as it can be given. It was Thursday and I was to leave on the Saturday of that week. I had already moved my affairs from the Department; had been in correspondence with Prof. Comstock and knew that he had assurances of being my successor. [II.] He had, in considering a previous arrangement with me, stated that his term at Cornell ended June 1st. [II.] and this fact with the further fact that, as the day of my leaving approached, it became evident that certain special work on the cotton insect report could not be satisfactorily finished, had led me in various conversations with the Chief Clerk to discuss the propriety of continuing work till the 1st of June, and of modifying my previous declination to remain till July. At Mr. Carman's suggestion I broached the subject to the Commissioner, explaining why it would, perhaps, be best for me to finish the work referred to; that there were parts of the South that I much desired to visit, and that I would remain till June 1st if he desired it. He replied that he understood I desired it; to which I retorted that I was indifferent, and the matter ended. We then conversed for some time on various subjects connected with my resignation. I expressed a wish to know (as he had up to that time preserved silence on the subject) whether he still thought, after the evidence, that I was guilty of what he had charged me with. He replied in the negative and said that I ought to have been less sensitive to his abrupt manner, as he was frequently annoyed and irritated by the constant flow of visitors into his office and the consequent interruption to his work. I confessed to possible haste, but felt that my course was justified by his subsequent action, as I had known for some time from letters received from Prof. Thomas that he had emphatically declined, and no disposition had been shown on his (the Commissioner's) part to retract or settle our differences. I then, in reply to the charge of instigating the statement in the Butler report about Prof. Thomas's "Caustic letter of refusal" explained the facts very much as they are given herewith and also stated Prof. Thomas's position and why he had declined.

At this meeting I expressed the desire to see Mr. Butler in presence of the Commissioner, since there was a question of veracity between us. He agreed to have Mr. Butler there the next day, but this gentleman failed to come. I then agreed to be present again on Saturday at 2 P.M. I was in my office from 2 to 4 P.M. as Mr. Howard, my clerk will testify, [II.] and at 4 P.M., or soon thereafter, went to the Commissioner's room to take my final leave and expressed disappointment at Mr. B's not coming, when to my surprise the Commissioner said he had been there, but that I had not been sent for as the matter was hardly worth while. I expressed a desire to get certain of the Department reports before leaving, and with the assurance that he had always appreciated my ability and that he believed I should do better outside than in the Department, we parted amicably.

This is a plain statement of the facts, condensed into as few words as possible and the truth of which I am ready to testify to under oath. There was much other conversation not particularly relevant.

A word as to the Thomas letters: Gen'l. Le Duc quotes one of April 2nd to himself and says:

"This is the letter upon which the press commented so severely, giving "Under the circumstances" as the reason for his declination. This confidential communication found its way to the public through the press and telegraph, but with the wording and spirit so garbled as to show an evident intention and desire to have pending negotiations looking to the appointment of Thomas suspended, and also that it might, as far as possible call down on the Commissioner the censure of that portion of the newspaper press which has so long been used for the furtherance of Mr. Riley's purposes. Meanwhile he wrote to Prof. Thomas requesting him as a friend to write to me and try to correct what he (Riley) thought was an erroneous impression; *i. e.*, to help him to get back into the Department.

There is the same misrepresentation here as throughout the rest of the Commissioner's letter. I was not sufficiently in Le Duc's confidence just at that time to know anything of his correspondence, and the "confidential communication" must have "found its way to the public" through those who were. Prof. Thomas will testify to the falsity of the last charge. I wrote to him to correct an erroneous impression, but not with a view of getting back into the Department. I call attention to letters [Nos. 3, 4, 5, 6, and 7, for further evidence. Prof. Thomas's course throughout was manly and honorable. He was the first person (being then in Washington) to whom I signified my intention of resigning, and he urged me strenuously not to do so. After the position had been tendered to him he twice declined it, but was subsequently led to accept. Certain facts then came to my knowledge that led me to believe that it would not be to his advantage to accept. He was led to do so finally by a promise of an annual salary of $3 000, and probably $3,500, but positively declined upon learning from me that the Commissioner had no legal means of giving him such a salary. I may add, by way of explanation, that I accepted the position a year before upon similar assurances of increased salary from the Commissioner, but upon finding that there was no chance of getting the increase which the Commissioner expected, in the regular appropriations, I was obliged to ask that an additional $1 000 compensation be allowed me by Congress, and got it. This was disallowed, without my knowledge, soon after my resignation, and I only became aware of the fact after Prof. Thomas's acceptance. When I learned that Prof. Thomas had declined, I used my best endeavors to secure the appointment of Prof. Comstock, in whom I felt much interest as having been the most enthusiastic student in a class before which I lectured at Cornell in 1872, and of whose earnestness and capability I had subsequently good evidence, as he worked with me in the summer and fall of 1878. The later acceptance by Prof. Thomas complicated matters and led to considerable correspondence

(For continuation see page 125.)

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address THE RURAL NEW-YORKER,
78 Duane Street, New York.

SATURDAY, FEB. 21, 1880.

A NOTE TO SUBSCRIBERS.

Attention is called to the several articles upon the Kinver Globe Mangel, an illustration in section of which is presented on our first page. From our own crop raised last season, we cannot speak of it too highly. It is very firm, solid, and at the same time sweet and tender, while its form is always shapely and the skin smooth. We had intended to send our subscribers a small quantity of this seed for trial, but were dissuaded for two reasons, viz., it is now offered by seedmen, and, second, we were informed that Vilmorin & Co. of Paris offered a yellow mangel that, as regards productiveness and solidity, is superior to the Kinver.

We thereupon ordered of the new kind a quantity large enough to be placed in our present Seed Distribution, which we are now making as fast as possible. Our object in thus calling special attention to this mangel is that we deem it worthy of a careful trial, to secure which premiums of some value for the best specimens will be announced in due time.

TO NEW SUBSCRIBERS.

We find that many of our new subscribers have not seen our Free Plant and Seed Distribution supplement and consequently know nothing as to its terms. We will therefore send this supplement free to all who apply until further notice.

As announced in our late issues, we can no longer supply back numbers of the Rural New-Yorker. Papers will be sent for one year from the date of the receipt of all subscriptions.

We should like to see in round numbers the cost per year of supporting the standing armies of the world. Suppose that all the armies were disbanded and that this sum were devoted to agricultural interests—*what* a change would come over the spirit of the world's dreams! Then let an International Congress be appointed to settle all international quarrels or civil discords.

We regretfully surrender so large a part of our space this week to Professor Riley's reply or defence. Yet it seems but just to him that we should do so. We print two affidavits that a letter soliciting the Rural's opinion of his fitness for the position of Entomologist to the Dep't. of Agriculture was received at this office. Such proof will, no doubt, satisfy the general reader. If Professor Riley deems it insufficient, we shall be pleased to give him additional proof, if he will call at this office.

The holders of the patent for the Cook Evaporator are pressing hard upon Congress for an extension of the patent. Already they have succeeded in their efforts before the House, and the measure is now before the Senate for decision. The patentee gets no benefit from such an extension, the manufacturers have already had the benefit of one extension, and there is no valid reason why they should obtain a second. In view of the large increase of sorghum cane culture in the near future, both for sirup and sugar, it is a matter of general importance that all appliances needed in the processes of manufacturing these products, should be procurable at the lowest prices consistent with excellence. This cannot be the case so long as any device is made a monopoly by being covered by a patent. While willingly conceding that the talent and labor of the inventor should be rewarded by the profits resulting from such a monopoly for a certain period, there seems to us neither consideration for the inventor nor justice to the public in continuing the monopoly solely for the benefit of the manufacturers. Farmers, through their clubs and granges, all over the West, are sending to Congress petitions against this extension, and we strongly urge upon farmers everywhere to follow this wide-awake example. No time should be lost; what is advisable in this matter should be done at once, by each grange and farmers' club straightway forwarding protests against this injurious measure to the Senators representing their respective States and the Representatives of their respective districts.

There is no subject relating to the internal economy of this country that deserves and is receiving so much attention at present as our enormous railroad system. The matter is now being investigated by Congress and several of the State legislatures, and is one worthy of the thoughtful consideration of every citizen who has the present prosperity and the future welfare of the country at heart. What legislation, State or national, is likely to conduce to the best results from these mediums of vast benefits to the country as well as of intolerable injustice and oppression to the individual, is a problem of difficult solution. One thing only seems certain—some change from the present course of mismanagement, unfair discrimination, and unscrupulous greed must soon be made. Stockholders in the companies, shippers by them, employees of them—in a word all who have any dealings with them, outside of those enjoying the loaves and fishes of high salaries, patronage, or favoritism, are deeply and justly dissatisfied with the present system, and eager for a change, confident that almost any one must be for the better. Besides the vexations and hardships imposed on the public by the arbitrary rules and tariffs of these vast corporations, their wealth and influence are becoming dangerous to the prosperity of the nation through the corruption of its legislators, and sometimes, it would seem, of its judges. Some check, some restraint, some limit must be set to the rapacity, caprice and unscrupulousness of these mighty bodies, and it will require the best thought of the nation to decide upon the most beneficial legislation to this salutary end.

PRESERVING SPECIMENS OF PLANTS AND FRUITS.

We are often at a loss how to preserve specimens of fruits and other agricultural products. We have tried to keep an unusually handsome bunch of grapes or a "prize" apple, but have found that it shriveled up, changed color, or was otherwise spoiled.

Dr. Nessler, of the Experimental Station at Karlsruhe, has been very successful with a solution containing a little acid—sulphite of lime in 20 per cent. spirits of wine. Alcohol alone has long been employed as an antiseptic, but when strong enough to prevent decay, it will usually affect the color or otherwise alter the appearance of the specimen. The fruit or plant should first be moistened with the alcohol and one to 10 drops of an eight-per-cent. solution of the sulphite added. The specimen is then covered with the alcohol. In preserving leaves and other substances liable to change color, not more than one or two drops of sulphite to every four ounces of the alcohol should be used. For roots, tubers, etc., which are liable to turn brown or grow dark-colored, three or four times the above quantity may be employed.

With this preparation, specimens of white and green grapes, of green leaves, and of roots have been kept for years in a light room without any visible alteration. This liquid will also prevent wines from turning brown and check fermentation. It can also be employed to preserve insects, fish, or small animals.

PROFESSIONAL CRIMINALS.

With the exception, perhaps, of doctors and schoolmasters, no class of the community is so familiar with manifestations of *heredity* as farmers, or so well accustomed to think of, and allow for, it practically as a most important natural force. But it is noteworthy that in this matter the farmer and stock-breeder are much more familiar with the bright side of the picture than with the dark. They habitually take more or less care, it is true, not to breed from weak, vicious, and unpromising animals; but the very fact of their doing so often prevents them from seeing the results which would be arrived at in case such animals were bred from. But in our criminal courts there is no lack of examples of results obtainable by breeding from bad stock; and it will be well for the community at large when the farmers take this matter to heart, in their capacity of citizens and legislators, for no class of men are likely to comprehend it more clearly than they or to act upon it more judiciously.

A story is even now going the rounds of the newspapers of an instance of heredity in crime furnished by a Massachusetts thief from the vicinity of Fall River, who appeared as a witness in a burglary trial, having turned State's evidence. He is the great-grandson of a notorious criminal, who was in State prison with seven of his sons at one time. The grandfather's ancestry is traced back to a noted pirate of colonial times, and his branch of the family has for over a century furnished noted criminals in every generation.

The question what shall be done with the possessors of traits and tendencies thus peculiar and obnoxious to society, has been less fully debated than would be well. The criminals have been harshly enough treated in all conscience at one time and another. But until quite recently the subject has seldom been enquired into in a calm and judicious spirit, and from the scientific point of view. In England, not so very many years ago, the custom was to hang criminals of almost every grade, whenever caught; and it will be noticed that this practice was not essentially unlike the familiar agricultural habit of sending to the butcher the cullings of the herd. There can be little doubt, for that matter, that the death penalty, which is still retained for crimes of deepest dye, is in some part an expression of the popular belief in the workings of heredity; and a determination that, in so far as society has the power, this force shall cease to work in certain particular cases and directions.

The indiscriminate slaughter of criminals of all sorts, turned out to be a grave mistake, however, since it made the dangerous classes heedless and desperate, and increased the gravity of crimes by teaching the lesson that "one may as well be killed for a sheep as a lamb." With the advance of civilization, transportation to Botany Bay, or some other penal colony, was substituted by the English for the death penalty, except in extreme cases; but now that the colonies have become settled with reputable people, they refuse to receive any more criminals, and the only means of disposing of them seems to be perpetual imprisonment. This view of the matter has been extremely well stated by the noted English Judge E. W. Cox, who died a few months since. He says, "There ought to be very little difficulty in dealing with professional criminals educated to crime, living by crime. They commit crime systematically, deliberately, with malice aforethought, calculating carefully the proportion which the chance of profit bears to the risk of detection, capture, trial, conviction and punishment—all of which are taken into the account." A professional criminal is never, or very rarely, reformed. In his mind crime is no sin; no self-reproach follows him; no conscience pricks him. It is his business. He fights with justice and its officers as his natural enemies whom to defy, to evade, to defeat, is a boast and not a shame. He weighs the value of his prize against the risk of penal servitude, and if he is caught, calls it his ill-luck and hopes for better luck next time. He calculates on spending a certain proportion of his life in jail and adapts himself to that condition, making his prison residence as comfortable as he can by good behavior while there and compensating for his forced temporary abstinence by reveling in every sensual pleasure when he is again at large. Reformation with such a man is hopeless. Punishment, at least such as it is now, does not deter him because it is his business to hazard it—precisely as the soldier does not shrink from the service although he knows that he must face the chance of wounds and death. It is his profession to risk his life and he does it. It is the profession of the thief to risk his liberty and he does it.

When, therefore, the Judge is satisfied that the prisoner is a professional criminal, his course is plain. Mercy is wasted on such a man. Leniency is of no advantage to the convict, and it is an injustice to the community. The effect of a short imprisonment is merely to send back the plunderer to prey upon society for a time, to be again returned to the dock after he has run up a new score of offences and probably educated a new race of thieves to assist and to succeed him in his business. Penal servitude should be inflexibly awarded to a convict of this class, the object of such a punishment being to restrain him for the longest possible period from the exercise of his nefarious calling and to make it more difficult for him to follow it after his release. We may be assured that, let freedom come when it will, his profession of preying upon the public will be resumed with double zest after so long an abstinence. The only care required in these cases is that the Judge should be fully assured by due inquiry that the prisoner is really a "professional" criminal. This fact may be ascertained both by inquiry and by considering the character of the offence. There are certain crimes, such, for example, as burglary effected with burglarious instruments, and pocket-picking dexterously done, which require an education for their successful accomplishment, and therefore the presumption is that the practitioner of them is a professional criminal. It will be well for the progress of civilization when society determines soberly and definitely that, in simple justice to itself, the breeding of this kind of animal must be checked by every possible means.

BREVITIES.

Notices of many valuable catalogues are crowded out of this issue of the Rural New-Yorker. They will be presented next week.

The Rural suggested some time ago that we needed a word that should comprise both agriculture and horticulture—one that could be easily spoken and of self-evident meaning. A correspondent suggests "Landculture," and the suggestion is not a bad one.

Several subscribers who take the Rural with the Inter-Ocean have sent us stamps for plants and seeds. We would state that our arrangements with the Inter-Ocean are such that all who forward their subscriptions through that journal are not required to pay postage on our "Free Plant and Seed Distribution."

We shall give next week the first of a series of articles by Mr. Chamberlain, entitled Western Farming. The series might equally well have taken the title of Comparative Farming, the object being to see what can be learned by a careful comparison of the different modes of farming in different parts of the country, more especially at the West. The articles will appear each week or alternate week.

Mr. J. B. Chapman, 2d, acknowledges the receipt of his corn premiums as follows:

Ovid, N. Y., Feb. 9th, 1880.—I send you many thanks for Corn Premium (I hear that the corn sheller is at the railroad station). Also many thanks to Sandwich Manufacturing Co. of Sandwich, Ill., for corn sheller, and for their liberality in giving it as a premium. I will also compliment you *highly* for the fair and impartial manner in which you awarded the prizes.

In view of the recent heavy advance in the price of white paper, newspaper publishers generally have three alternatives: An increase in their prices for subscriptions and advertisements; a reduction in the size of their papers or bankruptcy.—Commercial Advertiser, Chicago.

Speaking for ourselves, we do not at present propose to advance the price of the Rural New-Yorker, though we may possibly for 1881. We do not propose to reduce it in size. We do propose that the Rural shall be better in every way for the present year than it has ever been before, whatever the cost or loss to ourselves. The advance in the price of paper affords no shadow of excuse why journals should not fulfill every promise made to the public during the subscription campaign.

In an extremely interesting paper on American Roses by H. B. Ellwanger, to which we desire to make further reference, we find the following: "American Banner Rose. Sent out by Peter Henderson in 1878. A sport of Bon Silene. Growth moderate, foliage quite small and leathery; flowers carmine, striped and white. It will perhaps be popular as a novelty, but it has no intrinsic merit to make it valuable, and we cannot commend it." We copy the above to show that the fun we have poked at this Rose has not been without a show of reason. The phrases that "went the rounds" that its "buds were worth their weight in gold," &c., were published. It may be supposed, as a compliment to its well-known introducer, for we are positive that conscientious editors could never have published such from any knowledge they may have possessed of the Rose itself.

The Rural is receiving an unusually large number of inquiries as to commercial fertilizers and many readers ask us, "Which kind would you advise us to purchase?" We would be glad, indeed, if we could give valuable answers to such queries—but we cannot. Upon our own farm fine bone flour has, we think, thus far produced the most marked effects, while upon other farms, its effects have not been noticeable. The same may be said of other special fertilizers as, for instance, nitrate of soda, sulphate of potash, etc. Special oat, corn and wheat fertilizers are usually what are termed "perfect" fertilizers, like home-made manures, except that they are supposed to supply the needs of those plants as ascertained by chemical analysis. It will appear, however, that if one's land does not need phosphoric acid or potash, the money spent for those ingredients is poorly invested, though fine crops may result from the use of the fertilizer as a whole. We repeat our advice, so often given, that farmers will purchase small quantities of commercial fertilizers for the purpose of ascertaining what their soils most stand in need of, and apply them to small plots. In the mean time, should they need concentrated fertilizers, they can do no better than to purchase the special oat, corn, wheat, etc., manures offered by such establishments as Baugh and Sons, Baker and Brother, Mapes, Crocker, and many others.

(Continued from page 123.)

with Prof. Comstock which need not be introduced here, but which also shows that no idea of reinstatement could possibly have occupied my mind. I send only one letter to confirm what I say [Letter No. 8.]

One word as to the Commissioner's closing statement:

While all this was progressing, letters from various persons were received, evidently at the instance of Prof. Riley, to secure his reinstatement in the Department. These facts will, I think, sustain the statement that Prof. Riley industriously tried to get back into the Department after he had resigned.

This is of a piece with all the rest. I flatly deny having asked any soul to send such a letter, and I am not aware that any were sent. If the Commissioner has received such, he can easily ascertain whether they were penned at my instance, and there is no person in any part of the globe who can truthfully testify that I requested him or her to write such a letter, though such may have been written without my knowledge. So far from making any such request, it is a fact that while a number of influential men called at my residence, after the publication of my letter of resignation, either to express approval of my course or the hope that I would remain, I begged all who expressed the latter view to take no steps toward that end, as I would under no circumstances remain under Gen. Le Duc. As a specific illustration in point, Senator Paddock expressed the wish to go to the Commissioner with a delegation in my behalf, and desisted only at my instance, as he is ready to testify. There is one person to whom (prior to the circumstances that led to my final attitude) I admitted the possibility of remaining if the Commissioner should admit his error and desire me to remain. It was upon the suggestion of Senator Davis, of Va., present Chairman of the Senate Committee on Appropriations, that I submitted to the Commissioner the proposition to have the employees of my division provided for in the regular estimates. Mr Wm. H. Edwards, of Coalburg, W. Va.—a well known entomologist, and old-time correspondent of mine—was in my office the very day of my resignation, and expressed his surprise and regret thereat. Upon relating the salient facts of the matter he offered to see Senator Davis, with whom he had acquaintance, and I consented that he should, since he knew me well and I desired Senator Davis to have the facts, but not with a view of reinstatement.

There is good reason to believe that I could have brought sufficient influence to bear to accomplish reinstatement had I wished it; for I have since seen a divisional head discharged by the Commissioner but retained upon political influences being brought to bear on him, notwithstanding he had, in private correspondence, characterized and abused the party in a most severe and derogatory way.

A few closing words in explanation of the testimony adduced. The letters are copied verbatim from press copies or files. I have used only such letters or parts of letters as were absolutely necessary. The correctness of the statements followed by the letter H in brackets can be vouched for by Mr. L. O. Howard, who was my clerk and assistant. He knew of my correspondence on the subject, for most of the letters were dictated to him. A student at Cornell, he proved a capable and efficient clerk, and was interested with me in having Prof. Comstock as my successor, since I had him appointed upon the latter's recommendation His testimony is weighty; but the fact that I do not send it shows how difficult it is to get the truth when it affects persons having great patronage. Mr. Howard was willing to testify, but fearing that to do so would be to forfeit his position (the Commissioner having, it appears, announced that no friend of mine should remain in the Department) I hesitated to urge it and he finally went to the Commissioner to ask permission He reported that the interview was unsatisfactory, and upon my urging him that it was best in the long run to tell the truth, he agreed to be at my house the present evening to do so, but sent a card instead stating that it was impossible, and that he was to leave "on the 6:30 train to-night to be gone some time."*

Mr. Schwarz, whose statement [marked S] I send, was my clerk and assistant in the early part of my connection with the Department. The Commissioner found fault with him for no other reason than his German nativity and diffident address, but at my earnest solicitation I was allowed to keep him as a field agent, and he was in the employment of the Department and in constant correspondence with me till I left, since which time he has been engaged by the Entomological Commission. The evidence which I send of the other employees of the Department, [marked "Various"] who all expressed deep regret at my resignation, and with whom I consequently spoke on the subject, is but negative, but important under the circumstances, as I should have availed myself of the influence of some of them, had I desired reinstatement. In the same category is the fact that after my annual salary in the Department had been reduced to $1,900, as heretofore explained, I had financial reasons, aside from the others mentioned, for not caring to remain, since the salary of my present position is $3,000.

To sum up the matter: I accepted a position in the Department of Agriculture with the object of accomplishing practical good. In proportion, as I did so, envious obstacles had to be encountered. Not choosing to cringe and fawn, I resigned. The Commissioner either construed, without reason, my endeavors to remove unjust accusation into endeavors to be reinstated, or has wittingly conspired to misrepresent me. The same manners that offended me have made him many enemies, and he lays much at my door that comes from his own; for it is an old saying that if a man once wrong you he becomes your enemy. I challenge Gen. Le Duc to furnish proof of a single person in or out of the Department, to whom I expressed a wish to be reinstated or whom I asked to either see him or write to him for that purpose; and I stigmatize the report of conversation as an outrageous falsehood in so far as it attempts to give color to such wish.

Apologizing to those whom I have been unwillingly compelled to refer to in this matter, and regretting, sir, the necessity for so long a communication on a matter of so little public interest, I trust that you will bear in mind, as an excuse for its length, that your charges touched my sense of pride and honor and that I write in defense of my veracity. Respectfully yours,

Washington, D. C., Feb. 2d, 1880. C. V. RILEY.

S.

I hereby testify that I was in constant correspondence with Prof. Riley after learning through him of his resignation, and that I was present with him the last day of April, 1879, and while expressing my regrets thereat and hopes that he would remain in his position as Entomologist to the Department of Agriculture, his correspondence showed that he himself had no such intention, and he declared that he would not remain under Gen. Le Duc for any consideration. E. A. SCHWARZ.

Washington, D. C., Feb. 2d, 1880.

3. [Cyrus Thomas to C. V. Riley, Apr. 3, 1879.]

Your letter just to hand, both together. The result has been what I expected. I regret very much your haste, as it is always best never to decide under excitement where the matter is important.

I have already received two telegrams from the Commissioner offering me the position. To the first I replied mildly that my engagements were such that I could not accept the position at present. A second came, extending the time; to this I replied by letter that I could not accept in any case, as it would be no pecuniary advantage to me, and to break up housekeeping and move to Washington would entail a heavy expense. I have also written to him regretting that any difference should have arisen between you which made it necessary to sever your connections. I took the liberty to remark that I was aware from an intimate acquaintance with you that you were sometimes hasty, but that I was fully satisfied it was your intention and desire to be fair and honorable in your dealings and intercourse with others and that exhibition of haste or impatience on your part arose more from habit than willfulness. I also stated to him that if it were possible to adjust your differences, it would be gratifying to the friends of both. That as you were young, and ambitious and your ability as an entomologist acknowledged, I was sure you would be of great benefit to the Department.

I also informed him that the insertion of the words "Cotton Worm" in the clause making appropriation for the U. S. Ento. Com. was done without the knowledge or desire of the Commission, that you had informed me it was done without your knowledge at the time and contrary to your wish, and that I was fully satisfied of the correctness of your statement, as I knew this was not in the plan of the Commission I added at the close that I had no desire to suggest any course in this matter, but wrote to prevent him from obtaining a wrong impression in reference to the insertion of "Cotton Worm" in the appropriation.

4. [Riley to Thomas, April 7, 1869.]

Let me assure you that my resignation was not so hasty as you seem to imagine. I have the sympathy of most persons in the Department, and, had I not resigned at the time, I should have done so a week later after learning many things in regard to Le Due that I did not know before.

[Riley to Thomas, April 10, 1870.]

* * * The Department salary is $1900.00. I do not see in what way the Commissioner can offer you more, because the clause giving the entomologist additional compensation, which was in last years' bill, has been stricken out. He may not have been aware of this when he wrote you. One thing is sure, he has no *legal* means of increasing your compensation, and I should in all probability have resigned under the circumstances, had I not done so for other reasons. Now I cannot well see how you are to be quite as well off financially under these circumstances as you are with your present position; but as I wrote you this morning, you know best about your own affairs, and, I myself being out and you in this rather unpopular institution, I write mainly to say a word in behalf of Mr. Howard, my present assistant, and Mr. Pergande. I am satisfied that you have everything to gain by retaining them, and it would be a consolation to me to have some assurance from you that they would be retained under your charge. I hesitated really more about my resignation for Pergande's sake than for my own, as I was instrumental in bringing him here. If you can give me assurance on this head for their benefit, I shall esteem it a favor. Yours ever,

C. V. RILEY.

P. S. I want you to understand me fully about the salary. I shall inclose, in order that you may fully understand it, the Department appropriations as they will be made this year and as they are in the Legislative bill reported to the present House by the Democratic caucus. The bill differs materially from that of last year in being more particular in requiring the Commissioner to present full statements of expenditures and in preventing any diversion of the appropriations from the specific purpose for which they are made; and these changes have been made because of reported irregularities in the Commissioner's management. In the clause on page 79, referring to cotton insects, there was last year a provision enabling the Commissioner to give me $1000.00 additional compensation. That has also been stricken out.

I am thus particular simply because I wish you to be on your guard and not do what you think I have done in resigning—a foolish thing.

WASHINGTON D. C. Feb. 5. 1880.

EDITOR OF RURAL NEW-YORKER.

Dear Sir:—Prof. C. V. Riley has very courteously shown me a portion (from c 7 to c. 1. 7) of his proposed comments on my communication to the Hon. Wm. G. Le Duc of Jan 16, which communication was published in your paper of the 31st ult. and has propounded the following questions.

"1. Is not the statement correct?

2. Did I ever express to you a desire, or did any one else ever state to you, on my authority, that I desired to be reinstated?

3. Was not my conversation last December in New York to the effect that had you been more earnest in disabusing the Commissioner of his error, my resignation might have been prevented; in short that it referred to your action prior to and not after said resignation?"

While I have no disposition to assist in prolonging a newspaper controversy, which can result in no possible good to any one, justice both to Prof. Riley and myself requires that I should notice his statement and request.

That portion of his statement submitted to me is in some respects correct as far as I know, and in others not correct as I understand matters. I shall notice only the essential points. I have now no recollection that Prof. Riley ever in direct manner expressed to me his desire to be reinstated in the Department, but I have a distinct recollection that a few days after his resignation had been accepted, Mr. Cowing, one of the clerks of the Department, had some conversation with me on the subject during which the matter of interference in legislation was brought up, and the idea advanced that could the mind of the Commissioner be disabused from the impression that Prof. Riley had no hand in the legislation, the difference between the Commissioner and Prof. Riley might be adjusted, and Prof. Riley remain. Mr. Cowing says:

"As Prof. Riley disclaimed any such interference, I remarked if such fact was shown to the satisfaction of the Commissioner, I thought it would result in an amicable settlement of the misunderstanding, and that his resignation might be withdrawn. My recollection is that Prof. Riley acted upon this suggestion."

As I understand it Prof. Riley did act on the suggestion of Mr. Cowing, and obtained letters from some Senators and others tending to show he had done nothing in the matter of the legislation. I certainly obtained the impression from the conversation with Mr. Cowing and from Prof. Riley's subsequent action in obtaining the letters that he desired reinstatement Whether my impressions were well grounded or not, is for others to determine. All this was some days later than the date of his resignation.

My impressions were that Prof. Riley's remarks in New York in December last, applied to reinstatement, from the simple fact that I did not know of any matter of which it was necessary to disabuse the mind of the Commissioner previous to the date of resignation.

Prof. Riley assures me, however, that he referred to such action as I might have taken previous to his resignation This statement of course I will not dispute. I have no disposition to injure Prof. Riley, or make any statement calculated so to do. I recognize his great merit in his chosen branch of science, and did more to have his services retained by the government, than he is aware of, and I did it under the impression that it would be agreeable to him, and in accord with his desires.

Very respectfully

E. A. CARMAN.

6. [Thomas to Riley, April 14, 1879.]

An examination of the bill sent me by you convinced me the Commissioner could not pay me $3,000, as promised, without violating the law directly or indirectly. He also gave me reason to believe it would be brought to $3,500. This flattering offer, with others he obtained and sent, pressing me to accept, prevailed upon me to indicate my acceptance. But, fearing some slip, I very cautiously accepted his "telegraphed *proposition*" which read "salary sufficient *and* three thousand." This left me ample excuse if anything implied should be omitted. Again, he said that one thousand more would be given by the present bill. As it is evident to me that he cannot carry out his proposition, I am under no obligation to accept.

[Riley to Thomas, April 14th, 1879.]

I have never had anything to say about any caustic letters that you may have written to the Commissioner; for I have known nothing about them beyond what you have told me. If the Commissioner has enemies who love to make capital out of my resignation, mine is not the blame, and I am far from desiring to bring you into my quarrel with the Commissioner.

7. [Telegram from Thomas to Riley.]

PANA, ILLS., April 17th, 1879.

PROF. C. V. RILEY,

Cor. 13th and R. W., D. C.

I have sent Commissioner withdrawal of acceptance and final declination. THOMAS.

8. [J. H. Comstock to C. V. Riley, April 8th, 1879.]

It had not occurred to me to apply for the position of Entomologist until I received your letter. I have, however, this morning sent a letter of application as you suggested. With many thanks for your kindness, I am faithfully yours,

J. HENRY COMSTOCK.

[Comstock to Riley, April 10th, 1879.]

I saw Le Duc to-day; and he told me that Thomas had concluded to accept the position at Washington. So that ends my hopes in that direction. I write now to ascertain if you will apply for the position made vacant in Illinois. Of course Illinois would be delighted to procure your services could they make it worth your while to go there. If you do not go there, will you tell me what course to take to work for the position, and say a word for me? I have no idea to whom to write.

I think I could arrange matters here so that I could hold on to this place while trying that.

I received your telegram to-night on my return from Elmira I had learned from another source that Le Duc was to be there and so went over this A. M.

With many thanks for your kindness and interest. I am, very sincerely yours.

J. H. COMSTOCK.

(A) [C. V. Riley to Hon. J. D. C. Atkins, Chairman House Comm., on Appropriations, March 31st 1879.]

I wish to ask you to do me a personal favor. There were added to that clause, as reported to the House by your committee, without my knowledge and to my great surprise, the words—"and the cotton worm." Upon learning the fact I immediately wrote to Senator Windom and Senator Paddock, as chairmen respectively, of the Senate committees on Appropriations and Agriculture, begging them to have these words stricken out, and explaining that the Commission was created for the special investigation of the Rocky Mountain locust, or grasshopper, and that an investigation into the habits and best means of combatting the cotton worm was being made by this Department, and that a clause appropriating therefor was already in the Legislative, Executive and Departmental bill then pending.

I feared at the time that the addition of these few words would be chargeable to my efforts and would compromise me as Entomologist of the Department in the eyes of the Commissioner. My fears have been justified, and, having had nothing to do with the matter, I beg of you, for my own satisfaction and for my own honor before the Commissioner, to communicate to him such facts as you, as chairman of the Committee, undoubtedly possess, regarding the manner in which these words were incorporated into the bill as it came from the committee.

[Letter from Senator Paddock to C. V. Riley, Ap'l. 2, 1879.]

From first to last you expressed your disapproval of the words put into the entomological provision "and the cotton worm" and asked me to have them eliminated in the Senate. You drew an amendment which I sent to the committe to that end, but it was overlooked by the committee. I took the action that I did on the floor in reference to that provision, on the spur of the moment, because I was apprehensive that to attempt the change *there* might defeat all. I supposed that you would not be satisfied with my action then in that regard, but I did what I thought the temper of the Senate demanded. Your record throughout is as I have stated it, and to that I will be sworn if necessary. I have been and expect to be a good friend of the Agricultural Department. I shall take a good deal less interest in it if you leave it. I hope you will withdraw your resignation—and if you do not that the Commissioner will return it to you. I am sure very many of the best friends of the Department here and elsewhere will be greatly dissatisfied with such a change.

VARIOUS.

I addressed letters to various persons prominently employed in the Department, stating the charge of my endeavoring to get reinstated after resigning, and requesting reply to the question "Did I ever express to you any desire to be reinstated?" The written replies are: From Geo. Vasey, botanist, *Never;* from Wm. Saunders, supt. grounds, *No;* from Thos. Taylor, microscopist, *No;* from B. F. Fuller, disbursing clerk, *No;* from Peter Collier, chemist, "*I have no recollection that you ever did;*" from C. Worthington, statistician, "*the subject was never been mentioned:*" from Mr. L. O. Howard, my then clerk, *No;* from Mr. W. J. Cowing, *No.*

To some I gave positive assurances at the time that I would not remain under present management, and Messrs. Saunders, Taylor, Vasey, Howard and Cowing have testified to the fact.

* Later.—I have since learnt that his absence was due to the illness of a relative.

Floricultural.

GROWING PLANTS IN LIVING ROOMS.

PETER B. MEAD.

(Continued from last issue.)

OF Carnations decidedly the best for rooms is Sarah Mead. It is a very free bloomer, and deliciously fragrant. It should be in a south room. A beautiful plant, for either a south or an east room, is Lopezia elegans. It is in bloom nearly all winter. It should be pinched back during the summer till about September, allowing no flowers to appear. Ardisia crenulata is a fine berry plant for any room. Coronilla glauca, an old favorite of the ladies, will do best in a south room, but very well in an east room. It remains a long time in bloom. Lobelia gracilis is a fine drooping plant. Seed may be sown as late as August or September. Does well in an east or a west room.

For a hanging basket you can have Russellia juncea, Polypodium Kurrudrianum, Epiphyllums, Anthericum repens, vittatum, variegatum, etc.; but never put more than one plant of any kind in a hanging basket. The objects usually sold for hanging baskets are deplorable parodies on good taste and "the eternal fitness of things." For a fringe for the window nothing is better than Ivy.

For a warm south room a plant of Heliotrope is indispensable for its grateful fragrance. So, also, a plant or two of the winter-flowering Begonias are desirable for their constant and graceful bloom. Fuchsias will do best in a south room, but very well indeed also in either an east or a west room. Speciosa, Mrs. Marshall and Buchanani are the best for rooms; the last, indeed, is one of the best for winter blooming, either in rooms or in the greenhouse, that I have ever grown. It will, with

judicious management, bloom the whole year round. The corolla is light crimson, the scpals are white, and gracefully curved. It blooms very freely. Speciosa is a good "stand-by."

There are no better plants for rooms than the Cacti. They are all curious and interesting; some remarkably so. Many produce flowers of large size and great brilliancy. Some bloom in the night, and others in the day. The flowers of the night-bloomer last but a few hours, while those of the day-bloomer last from five to ten days. Epiphyllum truncatum and its congeners bloom in early and mid winter. Some of the Phyllocacti bloom in late winter and early spring. In spring, summer and autumn we have the Cereus and others. The nomenclature, however, is at present in a complete muddle. Cereus MacDonaldi is the best climbing night-bloomer for you. All the low-growing night-bloomers are good, and all have white flowers more or less agreeably fragrant There is only one red-flowered night-bloomer (Maynardii), and that is a hybrid. Of the Phyllocacti that are day-bloomers, Ackermani, Jenkensoni, speciosus, roseus and May-fly are among the best. The Epiphyllums are all good, and bloom abundantly. Cereus speciosissimus (day-bloomer) is simply splendid, and C. Mallisonii is very good. For greater variety, add a plant or two of Opuntia, Mammillaria, Echinopsis, Echinocactus, Aloe, Agave, Euphorbia, and many others which I have before me as I write. These all require to be kept warm, and those not growing may be kept in any room till growth begins. The Agaves require the least warmth.

An interesting collection of succulents for a cold room may consist of Sempervivums and Sedums. Of Sempervivums, say Lagerii, arachnoideum, arenarium, tomentosum, heterostochium, Pittonii, Californicum (syn. calcareum), soboliferum, Braunii, fimbristum, barbacidum, hirtum, Verlotii, hispidulum. I have many more, but these are mostly small growers, and very interesting. Sedums are, many of them, too spreading for room plants; but the following are quite suitable: Acre variegatum, sexangularum, anglicum, Japonicum variegatum (a beautiful fall and early winter-blooming plant), Sieboldii. Sieboldii variegatum, carneum variegatum, ternatum, Ewersii, Nevii, monregalense, albicans, album. These Sempervivums and Sedums are all hardy, and will do best without fire heat. In a warm room they soon get out of shape and lose all their interest.

A few bulbs, such as the Hyacinth, Jonquil, Triteleia, Amaryllis, etc., give an additional interest to the window garden. The Cyclamen is another good winter-bloomer, and a plant or two of the single Chinese Primrose must not be omitted. Ferns may be grown even in a north room, but it must be only moderately warm, not hot. Keep them well watered. Do not omit among Ferns, Platycerium alcicorne, the Stag's Horn Fern, which grows admirably in a room. A very pretty plant to place among them is Coprosma Bauertana variegata. It is also one of the most effective of all variegated plants for a cool room. Azaleas may also be put in a north room when in bloom, except the Lateritia type.

But this list is getting long, my time short, and I must stop somewhere, though many more might be added. I will close it, therefore, with the Calla, which, of course, must not be omitted from the smallest collection of room plants. In the spring (about the first of June or even earlier), put it aside where it will get no water, and let it dry up. In August turn it out of the pot, shake off all the loose earth, and pot it in a soil composed of at least half leaf mold. It should be copiously watered, especially when in bloom. A word or two about

Insects.

You will have more or less of these, according to the care you give your plants. You need have but few at any time, only you have got to make a good fight for it; in fact, to "fight it out on this line" all winter. You will have Green and Black Aphis, Red Spider, Mealy Bug, Scale, and perhaps a comparative stranger, the Black Thrips, the worst of them all. It fortunately happens that in killing one you mostly destroy the others. The remedies offered for sale are numerous; many of them very expensive, and some of them totally unfit to be used in a room. On the whole, I know of nothing better for your purpose than carbolic soap, especially that form of it known as Buchan's Carbolic Disinfecting Soap. It is cheap as well as good. It should be dissolved in warm water. If made too strong it is apt to injure the delicate new growth. Experience will soon teach you how strong to make it. The plants should be washed or syringed with it. Let it dry on. It will kill all the insects above named, if thoroughly applied. Tobacco dust is a good remedy for the Green Fly and Red Spider. If you prefer, you can save a tubful of strong soapsuds on wash day, and give the plants a good bath in it.

If your "old man" smokes, utilize him, and put a plant before him with every pipe. The novelty of the thing will amuse him at first, but he will probably tire of it after a while. Keep him at it, however. Reason and wrestle with him. Tell him how bad it is for the bugs, and how good for the plants. Keep him down to it. In the end he will either give up smoking, or take to the work kindly, with the consciousness that at last he is doing some good in the world. Then your turn will come. Take him in your arms and kiss him, and he will be the happiest man alive. There is too much smoke that does no good in the world.

In concluding these rambling remarks, I will just say that I do not advise that any one should, as a beginning, take all the plants above named. The list is presented to select from. You might begin with the Calla, Libonia, Lopezia, Chorozema, Rose, Fuchsia, Begonia, Hyacinth, Selaginella, Coronilla, Tradescantia, a few Cacti, or as many as your table will hold without crowding, and increase the number with other tables as your knowledge and taste increase. All the plants I have named are good for your purpose, and you can select such as you can most readily get. If you can do no better, begin with a single plant.

Literary Miscellany.

WILFUL'S CHRISTMAS EVE.

CHAPTER II.

(Concluded from page 110.)

"Are you implacable, Miss Darton?" he asked, gently. 'I can assure you it was solely to spare you embarrassment that Sidney withheld his rank."

Still harping on his friend!

"It does not signify," she said, coldly. "It is useless rebelling against the fate that has made me the ward of a woman who has no sympathy with me. How far is it from here to the nearest town? and when will the roads be passable?"

"Very soon, I fear; to Eartham the distance is about five miles. Why do you ask?"

"Because I am very much inclined to run away," she answered abruptly, and left him searching in vain for a clue to her strange speeches.

He discovered it in the course of the day, for Mrs. Lockwood whispered it in his ear, assuring him Lelia's repugnance was only assumed. Delighted to find the game in her own hands, Leila's guardian paid assiduous court to the Viscount, pinned her ward to her side in spite of the girl's efforts to escape, and began to take steps to bring about the match which was to relieve her of her willful charge, and enable her to proudly say that she had done her duty by her.

Norman Lee would have smiled at the lady's strategy, if he had not seen with mingled dismay and astonishment that Viscount Alleyne was a willing listener to all her pretty speeches, and appeared eager to conciliate the pouting Lelia. He hung over her chair, reminding her of their childish intimacy, laughing good-humoredly at her pettish replies, and refusing to be discouraged by them. The more she rebuked him, the more desirous he appeared of winning her goodwill.

Was his interest in her reviving already? and was he not only willing but eager to woo the bride his parents had selected for him? Norman Lee found himself wrestling with fierce jealousy, and Gertrude, whispering to her father that her head ached—she might have said her heart—went off to bed.

In vain did Lord Alleyne remind his companions that it was Christmas Eve, and that they ought to spend it right merrily. In vain did he repeat that they ought to sing all their favorite songs and glees, for it was the last evening they would spend at the farmhouse, as the roads were now reported passable, and vehicles had been engaged to carry them on the morrow to the Priory. Mrs. Lockwood assented to all he said, but mirth cannot be forced. Lelia would not sing, Norman Lee's voice was husky, Mr. Lockwood was dull without his daughter, and at an early hour they all retired, glad that the long, tedious evening was over.

Everyone went to their several apartments but Norman. Long after the fire had died out and the lights were extinguished, he was still standing with folded arms in the bay window of the deserted parlor, looking out at the night. Never at this festive season of the year had his thoughts been such gloomy ones—never had he felt so lonely; and he wrestled long with his disappointment, before he determined that it was his duty, as an honorable man to return to his quiet home in a southern county, and see Lelia Darton no more till she was the wife of his friend.

But while he mused, a light step came swiftly down the stairs, the outer door was unbarred, softly closed again, and a solitary female form flittered away in the darkness of the cheerless, frosty midnight.

He heard the sounds, but attached no importance to them, till, as he was slowly ascending to his own chamber, Gertrude Lockwood, wrapped in her traveling cloak, suddenly stood before him.

"Where is Lelia?" she gasped. "She stole from the room while I slept; her hat and Ulster are gone. Oh! Mr. Lee, what does it mean?"

The threat he had regarded as meaningless when it was uttered recurred to his mind; the footsteps hitherto unheeded were remembered with a shudder. Oh! why had he listened to them like one in a dream? Lelia had gone. The delicate girl had braved the bitter cold and the darkness, and wandered forth, none knew where.

He rushed to the door by which she had departed, and tried, with the help of his lamp, to trace her footsteps, and ascertain what route she had taken. But the snow was frozen too hard to retain any impression of them. He strained his eyes to discover some trace of her, but long since she had vanished, and not a sound broke the terrible silence that reigned around.

She had asked him in what direction lay the town; was it thither she had gone? She did not know—poor, impetuous child—how the partial thaw that had set in on the previous day had occasioned a flood that carried away the support of a frail bridge she would have to cross.

With mad haste he hurried over the moorland, praying Heaven that he might be able to overtake her before she attempted to cross the river; but when he reached its banks, she was nowhere to be seen, and the bridge had been wholly swept away!

Had she too been engulfed in the dark torrent whirling and eddying at his feet? The thought was too horrible to be dwelt on, yet he could not but fear that this must have been Lelia Darton's fate. He shouted her name till the echoes took it up and repeated it; but to no purpose! At last, half-frenzied with grief, he began to retrace his steps to the farm, to arouse Lord Alleyne and Mr. Lockwood, that they might help him to search for the lifeless form, which was all he hoped to recover.

One of the Viscount's dogs, a retriever, which Lelia had often patted and played with, had followed him, and was still at his heels when he left the river; but on reaching a coppice by the wayside, the dog bounded towards it, barking and whining, as if to invite him to follow.

Could Lelia be there? Had she heard his steps as he pursued her, and turned aside to avoid him? Again he called her by name, entreating her to answer him, while he went hither and thither, seeking her in vain.

Rover had gone in pursuit of a hare he had startled from its form, and Norman Lee, sick at heart, and thoroughly discouraged, was groping his way out of the copse, when he stumbled over the stump of a tree, and putting out his hand to save himself, it came in contact with the deathly cold face of a woman!

It was Lelia! he had found her, but how? No breath was fluttering on the pale lips to which he pressed his own; her head fell helplessly on his shoulder, and she was all unconscious of his frantic endeavors to arouse her. He pulled off his coat and wrapped it around her; he raised her in his arms, intending to carry her to the farm; but he had not strength to do this, and was almost in despair, when he remembered that there was a woodman's shanty in the copse that could not be at any great distance.

Thither he bore her joined on the way by the now penitent Rover. Laying the helpless Lelia on the ground, and making the animal crouch beside her, Norman Lee quickly gathered together a heap of the dead leaves and broken branches, and set light to them with the aid of the fuzees he had in his pocket.

As the blaze mounted higher, and flickered on the rigid features of the young girl, hope revived. He would not believe that she was dead, and he chafed her hands till, to his unutterable joy, her eyes began to unclose, and she could hear the tender voice that bade her live for his sake, and could no longer doubt that she was loved as fondly as she wished to be!

It was fear that had caused her to swoon; She had discovered that she was being pursued, and while attempting to conceal herself in the wood, had struck her head against the limb of a tree with such force that she remembered no more.

"Did Lord Alleyne send you to seek me?" she asked, when she was able to sit up, supported by the arms that tenderly embraced her.

"Did I need sending? Would I not freely lay down my life in your service, Lelia?"

"Yet you advocated his cause. It was the thought that I had been deceived in you that drove me away. I meant to go to an old servant in London, and get her to hide me till I was of age, and could set my guardians at defiance."

"Do you still think you cannot trust me, Lelia? If you knew the agony of mind I endured when I feared that you were forever lost to me——"

There was no need to say more, and the lovers sat in raptuous silence, till Lelia whispered:

"This has been the saddest Christmas Eve I have ever spent."

"But, love, it is already giving place to a brighter dawning! And, hark! I can hear steps and voices. Miss Lockwood has sent her father and Sidney to our aid, and the light of our fire has guided them hither."

"Whatever made that willful little creature run away?" Viscount Alleyne inquired of his friend, when they were all safely housed again, and Gertie, crying and rejoicing over the recovered Lelia, had led her away to take some repose.

"Was it not your fault? yours and Mrs. Lockwood's?" retorted Norman Lee, indignantly. "When she saw that, in spite of the unconcealed repugnance, you were easily incited to press your attentions upon her, and lend yourself to the unwomanly scheming of that hateful woman, can you wonder at her delicacy taking alarm. It was then, that imagining herself friendless, poor child, she fled."

"Stop a minute; you have quite misunderstood me!" cried the Viscount. "I was civil to Mrs. Lockwood solely because I love her stepdaughter. It was to try if I could learn from Miss Darton whether Gertrude Lockwood is disengaged that I hung about her chair in the evening?"

"Gertrude Lockwood!"

"Yes, yes, my old playfellow, Lelia is a charming little creature; but she lacks the repose of manner, the pure red and white complexion the——"

"That will do!" cried Norman Lee, grasping his hand and shaking it vigorously. "Accept my heartiest congratulations, old fellow. Our mistakes are at an end, and I foresee that we shall both be very happy in our choice."

And so they were. Mrs. Lockwood protested against her ward accepting the hand of an obscure country parson; but for once Lelia's willfulness stood her in good stead. There was a double wedding early in the ensuing autumn. General Froyle gave away the brides, and their bridegrooms have faithfully promised to return from the Continent and present themselves at the Priory in time to share the rejoicings to be held there in their honor next Christmas.

THE EYE-OPENER.

John and George Patty and G. F. Blythe, proprietors of the Patty House, Fond-du-Lac, Wis., were arrested on the 10th, charged with a lottery scheme to dispose of the hotel, valued at $10,000, and extra inducements amounting to $19,000. The special agent who made the arrest says they had already sold tickets amounting to $47,000, and that the scheme not only violated the law, but was fraudulent, inasmuch as the property was greatly over-estimated....The Northwest, and probably other parts of the country also, is being flooded with circulars, etc., principally from Chicago, promising enormous profits from small—or large—sums forwarded to shysters there to be used as margins in speculations in grain. This is just the same old dodge practised here by the "put and call" swindlers, and exposed in the RURAL a few weeks ago, and this fresh device is carried on either by the old sharpers or rascals of the same stripe... Seed swindles are now in order—the Hull-less oats, the branching corn, marvelous wheat, etc., etc., all coming from Old Nick knows where, and all worth extravagant prices....A snide hog cholera cure company out West has copied an endorsement of another similar fraud, and the fellows have fallen out. Nat Pearnetter and John McLean are the copied indorsers....A "bug" exterminator humbug recipe is being hawked about out West which may be recognized as containing as one of the ingredients a 50-cent package of Nye's Bug Exterminator....The Supreme Court of Iowa has decided—against the verdict of the District Court—that when a promissory note given to a lightning-rod man, a patent-right agent, or other traveling swindler, has been afterwards raised to a larger amount, the innocent giver is not liable for more than the amount of the original contract...Potter, Wright & Co., "Bankers", 35 Wall St, do a "put and call" business like the swindles of the same kind exposed at length in RURAL of Jan. 17th.

Kenneth Albro, a rich old Texan cattle man unacquainted with the tricks of city sharpers, came to New York last week with $125,000 in registered bonds, which he carried in an old satchel, but while he was going up the Wall street entrance of the Treasury building two men fooled him by dropping a pocket-book, knocking him down when he stooped to pick it up and making off with his bonds. He has advertised for their return, and another advertisement signed "Tommy" says he can have them for $25,000 cash. Albro offers $5,000. The dropped pocket-book is an old dodge, played frequently on those who look like countrymen, especially at the ferries from the railroad terminus in Jersey City. It is also practiced extensively in other large cities.

For Women.

CONDUCTED BY MISS RAY CLARK.

BABY'S WALKING MATCH.

HURRAH! Baby's on the track!
Got the word to "Go!"
Strength of limb he does'nt lack,
Toddling to and fro.

Mother is a judge so true;
There's no doubt he'll win;
See the pretty belt of blue,
Round his waist to pin.

Many strides he has to take
In the shade and sun;
Many miles he has to make
Ere the match be won.

Bravo! Up and down he goes,
Holding fast to chairs;
Rosy fingers, rosy toes,
Pretty little airs.

This is but the first wee match,
Just his speed to try
A much better gh
Walking by and by.

Here he comes, the proud, wee chap,
Beating all the others!
Now he takes his final lap;
But that lap is mother's!

—*N Y., Independent.*

FASHIONS IN LACE GOODS.

Tinted Snow-Flakes.—Fichus.—Medici Ruff.—How to Rejuvenate a Partly-worn Dress.

TOILET accessories in the way of ribbons, artificial flowers, and laces—more particularly the latter—designed for neck and sleeve ornamentation, take greater prominence each succeeding season. It seems not unlikely that woman's fondness for "fine linen" (freely translated, "laces") will, at no distant day tempt her to make it the principal item of her costume and to subordinate heavier materials, however rich, to a mere background for the display of ingenious devices in gossamer-like fabrics. Even now lace perches on her head, nestles at her throat, falls in soft lines from sleeve and glove-top, peeps from slippered foot and appears in a bewildering array of jabots and flounces over the body of the costume.

The eagerness with which novelties in lace goods are welcomed, stimulates those manufacturers who cater to the caprices of the world of fashion to continuous effort of bringing out new designs and materials with which beauty shall enhance its loveliness and plainness soften ungraceful outlines and harsh features. No fabric of this class, however, met with greater popularity than the Snow-flake tulle, introduced this season. It is suggestive, as to design, of dotted Swiss—that favorite of other days, which has of late years been dropped from the category of available dress materials, and relegated to window, and dressing-table service.

The Snow-flake is, however, much more dainty in effect and is not confined to white, but comes in the greatest variety of tints, and colors; pale blue, pink, lavender and cream, being leading shades.

It combines charmingly with silk, and sets—comprising caps or turbans, heart-shaped neck-pieces and cuffs—are shown of it in combination with silk and edgings of some one of the fashionable laces. It is also extensively worn simply twisted about the neck and brought down to the waist in those shroud-like vests—so suggestive of undertakers' wares—which it is, one of the fashionable vagaries of the hour to wear.

This tulle shares the popularity of French figured mull, Swiss and variegated pongee as a basis for many graceful and beautiful designs for throat, head, hands and arm garniture. There is a partial tendency to return to the less elaborate style of ruff, and in the Medici Ruff, the extreme of simplicity is reached. A plain standing ruff around the neck, extending down the front to the waist-line and that is all there is of it! One misses the riotous jabat, with its wealth of edging, bright with tiny bows or clusters of flowers and in com-

parison the "Medici" looks uncompromisingly stiff.

Manufactured sets in lace goods are small, many of them barely covering the upper portion of the shoulders and only reaching a few inches down the front. Very few are made exclusively of lace and insertion, most have interminglings of silk and mull or snow-flake, or some similar material.

Fichus and capes are shown in a great variety of styles and combinations, the most striking ones being in black. Chenille, jet, French and Chantilly laces are usual garnitures, and they are disposed in every way which the taste and ingenuity of the designer can devise.

It *is* whispered in the privacy of the boudoir that these capes and fichus, both in white and black, not only finish a toilet most charmingly, but that they have the additional merit of being very useful on occasion. For example, a black silk dress which has a worn appearance across the back, over the bust and at the elbows, can, by means of one of these capes, a pair of scissors and a few yards of lace, be made to put on an appearance of extreme juvenility. The scissors are applied to the sleeves at the elbows (or thereabouts), and the result of the surgical operation is completely hidden under a mass of tastefully arranged rows of lace.

This is, however, strictly *sub-rosa*. For should it ever become generally known, every lady who appeared with one of these "studies" in lace and jet, would be suspected of wearing it to cover a greater or less multitude of "shiny" and worn sins on part of her dress; which would, of course, be a cruel libel in most cases, perhaps.

Messrs. Lord & Taylor of Broadway and Twentieth Street, who kindly supplied information detailed above, have a fine line of lace goods in stock. FAITH RIPLEY.

COFFEE HOUSES AS A SUBSTITUTE.

A MOVEMENT well deserving of public notice has been inaugurated in the border town of Annan. A noble lady the (the Marchioness of Queensberry), out-distancing the well intentioned efforts of Good Templars and teetotalers, has taken a short cut to the reform of our national vice—which has always, even to put it mildly, been an ultra-fashionable one in Annan—by opening a coffee palace that, in attractiveness and comfort and cheapness, can more than bear comparison with the old places of resort it is intended to rival and supplant.

So far it has succeeded beyond expectation—perhaps not financially, though of that her ladyship takes small account, but—in the list of young men who have joined as members of the reading and recreation rooms, to which the upper story has been devoted and the numbers who resort to the elegantly fitted up bar, on the ground floor, for a cup of tea, cocoa, or coffee, all at the moderate sum of 1*d*., or to indulge in a regular feed for something less than 6*d*. For the more ambitious, a private room adjoins the public one, where for a trifling gratuity to the civil attentive keepers of the place—old retainers of the Kinmouth family—a comfortable lunch will be set out on a neatly-covered table at the same cheap rate as is charged in the bar.

A framed tariff, in good large type, hangs conspicuously over the chimney-piece, so that those of limited means can calculate their expenses to a nicety before ordering what they want.

Surely this is the royal road to the reformation so earnestly desired and so greatly needed. That many resort to the public houses for the sake of the convivial enjoyment to be found there, too often to escape from a comfortless, unhappy home and not from the mere love of drink, only the pessimist will be prepared to deny. And if an equally, or perhaps more attractive place of resort is offered them, where the company is as good or better, where no half-inebriated fool plays the jester for the amusement of his fellows, only a stage less maudlin than himself—where no fumes of stale drink make the atmosphere almost unbearable, and where nothing that can hurt either mind or body tempts the weak or unwary—then those who know anything of a movement like the present, and watch with sanguine expectation for a visible return, in the best of all currency, to the twice noble lady who has initiated and carries on at her own risk this attempt to do battle with the country's curse. A. L. O. S.

WOOLENS.

WHAT warmth and comfort in the very pronunciation! I have just repaired some flannels and for wristbands took the tops of a pair of old socks, stretched them on the press-board, which tapers, drew the sleeve over it till the turned-in edge just overlapped the raveled edge of the sock-rib; I felled the sleeve to it, nicely drew it off, turned it and sewed down the sock edge. This makes an elastic band which yields to the motions of the body. It would be better, of course, to have knit flannels entire, but they are very expensive, a double set costing $9 and lasting only two winters. Good flannel one yard wide may be bought for 50 cents per yard, and 10 yards will make two sets (if economically cut) of shirts and drawers. Shrink the flannel, cut to fit closely and finish the *wrist* and *ankles* with a knit rib, put on as directed above. They will last three winters.

Now that striped stockings are so fashionable, all the odd bits of bright colored yarn may go to make up a pair of hose for a child. Stripe according to quantities of each color. Use white for the top, heel and toe, gray, black or drab for the ground, make a broad stripe just above the shoe top grading into narrow stripes on each side, of bright red or blue with a mingling of green or orange.

Sock ribs lose their elasticity with age, and become discolored by bad washing. Wind these into a ball for darning the feet of old socks and save your pretty white yarn for knitting fleecy new ones. Knitting is play and may be done while warming your feet, at twilight or during the reading hours of long winter evenings when too tired to do anything, but knit and listen to the reading of a charming story. M. L. S.

CORRESPONDENTS' CORNER.

WHAT history of the United States can I get which would be suitable for a school district library? I would like one recently written, and coming down as nearly as possible to the present time. F. D. C.

ANS.—Barnes's Brief History of the United States, Published by A. L. Barnes & Co., 113 and 115 William St., N. Y. City. Price $1.50. Ridpath's is also *good;* it is more detailed. Price $3. Both may be obtained from the American News Co.

WHAT will remove grease, &c., from woolen and other goods? T. B. A.

ANS.—Use "Household Ammonia;" ask your grocer for it.

WILL some of the "RURAL" ladies give recipe for bandoline. J. C. Q.

ANS.—The simplest is soap and water. This is not always efficient. Here is a venerable and familiar one: Take bruised quince seeds, a table-spoonful; clear rain-water a pint. Boil gently to three-quarters of a pint, then strain through muslin, and add alcohol or brandy, and Cologne water, of each two tablespoonfuls.

CAN you tell me the name of the publishers and the price of the book, "Twenty-five cent dinners for a family of six," and "Fifteen cent dinners for a family of six"? What do you consider the best work on Elementary Entomology. Who is publisher and what is the price? CORRESPONDENTS.

ANS.—We refer you to the American News Co., where information can be obtained and books procured. In reply to the second question we would recommend "Packer's Guide to the Study of Insects." This may also be purchased of the American News Co.

THE doctors say that sealskin is unhealthy. Bless them! Now, if they can be induced to say the same of six-button kids, point lace, and a few such trifles, coming generations of married men will rise up and call them blessed.—Boston Transcript.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

SANITARY ADVICE IN VERSE.

IF the Editors will permit, my fourth and last article will consist of a poem, copied from an old newspaper, which sums up the whole in a few lines, and in better words than I can command.

MARY BEAL M'LOUTH.

"There's a skin without and a skin within,
A covering skin and a lining skin;
But the skin within is the skin without,
Doubled inwards and carried completely throughout.

The palate, the nostrils, the windpipe, and throat,
Are all of them lined with this inner coat,
Which through every part is made to extend—
Lungs, liver and bowels, from end to end.

The outside skin is a marvelous plan
For exuding the dregs of the flesh of man:
While the inner extracts from the food and the air
What is needed the waste in his flesh to repair.

While it goes well with the outside skin,
You may feel pretty sure all's right within,
For if anything puts the inner skin out
Of order, it troubles the skin without.

The doctor, you know, examines your tongue
To see if your stomach or bowels are wrong;
If he feels that your hand is hot and dry
He is able to tell you the reason why.

Too much brandy, whisky or gin
Is apt to disorder the skin within:
While if dirty, or dry, the skin without
Refuses to let the sweat come out.

Good people all! have a care of your skin,
Both that without and that within;
To the first you'll give plenty of water and soap,
To the last little beside water, we'll hope.

But always be very particular where
You get your water, your food, and your air,
For if these be tainted, or rendered impure,
It will have its effect on your blood, be sure.

The food which will ever for you be the best
Is that you like most, and can soon digest;
All unripe fruit and decaying flesh
Beware of, and fish that is not very fresh.

Your water, transparent and pure as you think it,
Had better be filtered and boiled ere you drink it:
Unless you know surely that nothing unsound
Can have got to it over or under the ground.

But of all things the most I would have you beware
Of breathing the poison of once breathed air;
When in bed, whether out or at home you may be,
Always open your window and let it go free.

With clothing and exercise keep yourself warm,
And change your clothes quickly if drenched in a storm:
For a cold caught by chilling the outside skin
Flies at once to the delicate lining within.

All you who thus kindly take care of your skin,
And attend to its wants without and within,
Need never of cholera feel any fears,
And your skin may last you a hundred years."

A CHAPTER ON CARPETS.

MARY F. M'CLOUD.

IN the purchase of a carpet, like anything else sustaining much wear, the best of its kind is always the cheapest. In the various Brussels and velvets the back should be firm and the pile close and thick. For three-plies, ingrains, etc., the entire weave should be close, with no loosely-drawn threads on top, as is often the case in large figures. All raised figures wear off first, and extremely brilliant colors show fade and soil quicker than subdued colors or neutral tints. Now that we have patent exhibitors that seem to display a thousand yards at once, no one need remain in doubt one minute as to how a pattern will look when on the floor. It is always best to know the exact size of the room to be fitted, and have the figures matched where purchased.

Be certain it lies smooth and even on the floor, as ever so small a bulk will soon show wear. Always place something under to lessen the friction, particularly under stair carpets. Paper will answer if nothing better is at hand, but for rooms and halls straw is much superior, as the dust passes through it and lies on the floor. With velvets, Brussels, etc., make it a rule to sweep but little. Pick everything off that can be gathered in that way, and use dust-pan and brush, brushing the dust right into the pan, and never sweeping it the length of the room as is common with other carpets.

Give plenty of air without allowing the sun to strike constantly on one spot, as through a door or window. Stained spots may be greatly benefited by the judicious use of aniline dyes, and it will brighten faded colors to dampen them with water in which a small quantity of spirits of ammonia and borax has been mixed. A new broom should be kept for the use of carpets that are to be swept, as woolen carpets wear off very fast if swept with old, stiff, short brooms, and pieces of oil cloth or oil cloth mats should be used in front of the grate or stove.

On festive occasions, when dancing and promenading are the "order of the day," a cover of unbleached muslin stretched tightly over the carpet will preserve it unsullied. It has always been our custom to change the strips of carpet as they become worn, ripping them apart and putting the outside strips in the center, changing again and again as long as there is any beauty or wear in it, and finally cutting across the middle and turning the ends together. The strips need not all be cut one length and the seams will not all come in a line—then it can be renovated with a border. Of course such a carpet descends in the social scale, from parlor to bed-room and dining-room, and finally finishes off in the kitchen, where it can be pieced out to proper size with oil cloth.

The most common insect we have to contend with is the moth, and after having the binding eaten off from several carpets I have learned that a slight dust of Scotch snuff around where the carpets are tacked will keep them away. Salt is good but draws dampness. Strips of paper dipped in turpentine or carbolic acid and placed under the edges are also good, but scent a room so strongly that it is very unpleasant. A wet towel spread over a suspected harbor of the insects and pressed with a hot flat-iron is sure death, but needs to be repeated often.

To cleanse a carpet on the floor, clean, damp, sawdust is very good swept back and forth. It catches the dust, and will not soil even delicate colors. A broom dipped in a large pan or pail of water and drawn across a few feet at a time—dipping the broom afresh in the water and not having it too wet—is a good method. The water may need changing and a piece of oilcloth should be placed under the vessel of water. When a carpet is lifted from the floor, give a thorough shaking, then hang across a line, and whip with long withes. This is all that most carpets need. If there is grease on it, spread on a clean floor, use a brush, hot water, soap, and plenty of spirits of ammonia, rub both sides and rinse.

Rag carpets may be scrubbed with a broom to very good advantage, afterward hanging to dry. If very dirty soak first. To disinfect carpets from the sick room of contagious diseases, should never be neglected, as their properties of absorbing moisture make them grand receptacles of disease.

After taking them from the floor and cleansing them, if they cannot be washed, the entire surface should be wiped off with a cloth dipped in water strongly impregnated with carbolic acid, after which they should be hung in the air in some out-building, until all danger is past. Another plan is to smoke them over sulphur, but this is sometimes injurious to the colors.

Not uncommonly we hear the complaint of fleas harboring in carpets, and when once lodged in a soft carpet, it is some task to get rid of them. Plenty of salt, swept back and forth over the surface is a sure remedy, as they will not stay anywhere, where salt comes in contact with them.

Somebody has discovered that old rag carpets may be rejuvenated by a coat of paint, and it is asserted they both look and wear well. The carpet is stretched tightly and tacked, then a coat of paint of the same kind as applied to the outside of the building is brushed heavily on and carefully dried. The color is generally buff or orange, and may be striped, barred or left plain. Old carpets, unlike many things, never cease to be useful. After they can no longer be used as a covering for the floor, they make good mats for the hot-bed and cold-frame; useful coverings for sick animals; safe wraps for our bulbs and tubers in cellars that are not quite frost-proof, and when worn entirely into shreds, good mulch about young shrubs if covered with soil; or they can be placed in the forks of fruit trees to catch insects, and are of great value in the lining of a rockery, etc., etc.

COLORING RECIPES.

Brown on Cotton or Woolen.

For 10 pounds of cloth or yarn, take two pounds catch, put into cold water sufficient to cover the goods, heat until dissolved; then add one-fourth pound blue vitriol, previously dissolved. Put in the goods and scald one hour or more, wring from the dye. Dissolve six ounces bichromate of potash in hot water, put in the goods, let simmer fifteen minutes and boil five minutes, stirring constantly. Dissolve the catch in iron and the bichromate in brass. Rinse thoroughly in clear water or in suds.

Yellow on Cotton.

Dissolve one-half pound sugar of lead in hot water and one-fourth pound bichromate of potash in cold water—both in wooden vessels. Dip first in lead water, wring, then dip in potash and wring out. Repeat until the desired shade is obtained. This is for five pounds of goods.

Orange on Cotton.

Take a lump of lime as large as your fist, pour on to it a pail of boiling water, let it settle, pour off the water and while boiling, dip in cloth colored yellow as above, and you will have a beautiful orange.

Blue on Cotton.

Take two ounces oxalic acid; two ounces Prussian blue and dissolve in separate pails of hot water. Dip the goods first in the acid, then in the blue. Wring dry and repeat until the color suits.

For Green.

Dip blue into a yellow dye as above, and it will produce green.

To Dye Scarlet.

To every pound of yarn take one gallon soft water, one ounce of pulverized cochineal; two ounces cream-of-tartar; one ounce solution of tin. When the water boils put in the cream-of-tartar, then the cochineal. When dissolved, add solution of tin; put the yarn in, stirring it all the time, let it boil 15 minutes, air it once or twice, rinse in soft water, and you will have a splendid color.

Salmon on Cotton.

One pound copperas; one-half pound saleratus, dissolve in hot water. Dip first in copperas and air five minutes, then in saleratus, and dry in the hot sun.—MRS. E. M. DUTTON.

DOMESTIC RECIPES.

Potted Fresh Fish.

CLEAN, wash and let remain over night in cold, salted water. For six pounds of fish allow three ounces of salt, two of ground pepper, two of allspice and one of cloves. Into an earthen jar put alternate layers of fish and spice with a dust of flour and a few bits of butter. Pour over equal parts of vinegar and water till the fish is well covered, tie a floured cloth over the top to prevent the steam escaping and bake five hours. Let remain until cold, then cut in slices. MRS. L. B.

Cream-of-Tartar Biscuits.

One quart of flour; one pint of milk; one teaspoonful of soda; two of cream-of-tartar and one of salt. Butter the size of an egg. Mix the cream-of-tartar with the flour, rub in the butter and salt, dissolve the soda in a teaspoonful of boiling water, and mix all together lightly. S. R.

QUESTIONS ANSWERED.

Chocolate for Cake. Analine for Cake.

Please give directions for preparing chocolate to put between layers of cake and on top, also is analine poisonous? I refer to it as used in small quantities for coloring cake etc.

A YOUNG CAKEMAKER.

ANS.—1, Grate one-fourth pound of chocolate, add a teacupful each of milk and powdered sugar. Boil slowly—careful not to burn it—and when quite stiff stir in the beaten yelk of an egg. Take from the fire at once, flavor, and spread over the cake. Or, take whites of two eggs, beaten stiff, one and one-half cup of powdered sugar and six tablespoonsful of grated chocolate. Flavor with two teaspoonsful of vanilla. 2. It is poisonous.

Flickering Lamp.

What will prevent a student lamp from flickering? READER.

ANS.—Do not press the glass chimney too far down in the socket. Allow the air to draw freely through the air holes.

CORRECTION.—"Lemon Juice," the heading of a recipe in last week's RURAL, ought to have read Lemon Jelly. E. M.

News of the Week.

MISCELLANEOUS.

Monday, February 16, 1880.

The newspapers are filled with distressing accounts of the Irish famine. The New York Herald is the faithful champion of the suffering people's cause. Up to Monday morning the 13th, the Herald fund had increased to $200,692.56. It is especially New York city that is contributing to the fund. Long lists of the names of the givers are published in the Herald every day. But it is found impossible to reach all who are willing to contribute their mite by solicitation. Contribution boxes have therefore been placed in the frequented thoroughfares throughout the city, and it is hoped that a sum which, in some measure, will alleviate the distress, may speedily be collected. Irishmen are talking of abolishing all demonstrations, balls and gayeties on St. Patrick's day, and using the money which would be thus uselessly expended, to swell the Herald fund.....The New York Senate have unanimously passed the bill entitling women to vote for and fill school offices. The lower branch of the Iowa Legislature has also passed a woman suffrage amendment to the State constitution, 56 to 24. The women are scoring a steady progress over the country.

AGRICULTURAL NEWS.

A large sorghum sugar factory will probably be opened at Edwardsville, Ill., this year. The firm is to consist of Mr. Belcher, of St. Louis, Mr, Schwarz, of Edwardsville, our occasional correspondent, and Mr. Miller of Minn., all widely known in connection with this new industry....In California there are three beet sugar factories, one at Iseleton, in Sacramento Co.; one at Alverado, and one at Soquel, about which, a correspondent wrote to "Everywhere" some time back....The last is reported to be closing up and out at a heavy loss. Upwards of half a million dollars are said to have been lost in beet sugar experiments in Sacramento Co., while the outlay in the State in this industry is put at a million dollars with results either disastrous or wholly unsatisfactory....The glucose manufacturers in Buffalo, N. Y., make from $30,000 to $40,000 per week. The stock in one concern originally valued at $100 each share is now worth $20,000....The Maine State college farm has paid its way the current year, and earned about $200 more than its expenses....The Senate Committee on Education and Labor has agreed to recommend for passage the bill introduced by Senator Burnside, providing that the net proceeds of sales of public lands, and the net receipts of the Patent Office, shall hereafter be devoted to the establishment of an educational fund, to be appropriated annually among the several States and Territories, and the District of Columbia....Returns from 151 towns in Conn., as to the working of the tramp law, which went into effect last May, show that there if a unanimous verdict in favor of the law as having driven the tramps from the State, greatly lessening town expenses, giving security to the rural districts, and inflicting no wrong on any man....The Imperial Mills new elevator in Chicago was blown down on the 12th inst, and its 123,000 bushels of grain spilled on the ground—loss on grain $65,000; on elevator $90,000 to $100,000; on mill attached, $50,000 . A bill has been introduced into the N. J. Legislature to prevent tae polution of rivers and creeks ...The President has issued a proclamation premising that preparations are on foot for an organized and forcible settlement upon lands in the Indian Territory, warning all persons against entering upon such lands without express permission of the Indian department, and notifying all invaders that they will be forcibly removed by the Federal Government....The International Dairy Fair Association held its annual meeting and election of officers, in this city, Feb. 10. Two tickets were in the field, the "regular" with Hon, H. Smith, of Sheboygan, Wis., at the head of the other candidates mentioned here last week, and the independent with Francis D. Moulton at its head. The latter ticket triumphed. The following are the officers for the current year: Pres., Francis D. Moulton; 1st Vice-Pres., Colonel R. P. McGlincey; Sec., T. Mortimer Seaver; Treas., Wash. Wndsor; and a long list of Vice-Presidents, ..The Association bitterly denounced the oleomargarine fraud and appointed a committee of 15 to take action for the suppression of the fraudulent traffic; and in their efforts they were instructed to co-operate with the Society for the Prevention of Adulteration in Butter, of this city.....The war against oleomargarine is carried on steadily here and in Brooklyn, and has now extended to Jersey City. Arrests are being constantly made of retail dealers, who sell the stuff as genuine butter....The negro exodus has already added about 15,000 to the population of Kansas, most of them devoted to farming....$70,000 have been subscribed for that beet sugar factory at Franklin, Mass., and 400 acres of beets are pledged for the first year's crop....The Southern States seem to be getting wild on cotton to the neglect of food crops. However this may turn out for the South, it is likely to be good for the West whence most of the imported food will be drawn next year....Wheat looks fine in Indiana; stock are in good condition, beef animals scarce....There seems to be a falling-off of 1,000,000 hogs this year as compared with last, so that prices should still rule high....Reports from the leading dealers in agricultural machinery and implements show that their orders are greatly ahead of this time last year.....Duluth shipped half a million barrels of flour last year....Nearly two-thirds of the cultivated area of Minnesota are devoted to wheat. In 1859, the acreage under this crop was 124,972, last year it was 2,769,369....The population in Germany increases faster than the production of grain. Germany annually imports from 40,000,000 to 50,000,000 bushels of grain....It is said that the cost of converting wheat into flour in France amounts to only from twenty to twenty-five cents per 250 pounds....Wheat in England was highest during the past year on November 8, namely: 50 shillings five pence per quarter; and lowest on February 22, namely: 37 shillings seven pence per quarter....A "New Process" mill with 14 run of stories, is being built at Harrisburg, Pa. ....Three-fourths of the lard used in Germany comes from this country....The railroad rates from Chicago to this city are on the basis of 80c. per 100 pounds for flour; 40c. for grain, and 45 cents for provisions.....Ocean freights are lower than for a long time..... The St. Louis Fair Association has an indebtedness of $170,000.....The gold and silver mines of this country, from 1849 to 1875, 27 years, yielded $1,617,000, while the value of agricultural products of one year, 1877, was $1,594,000. In a word, the farmer has added to the wealth of the country almost as much in a single year as the miner in 27....Agriculture, is to be made an obligatory study in all elementary schools of France. This is a recent action of the French Senate, and was adopted by a majority of 254 votes.....It is said that the proceeds from the sale of tickets at the late International Fair at this city paid all expenses.....Geese are raised for their feathers in Texas. One goose ranche in western Texas has 300 geese, whose feathers are plucked every two months, each one averaging a pound and a half a year.....At the Marquis of Huntley's late sale of Polled Angus cattle, in Scotland, 37 animals brought an average of $221 apiece.....The prices of the Polled cattle has been much less affected by the late depression than those of the Short-horns or any other breed.....The production of beet root sugar in Europe, according to the statistics furnished by Herr Licht of Magdeburg, was 1,380,000 tons for 1879, against 1,574,154 tons for 1878. This amount is divided as follows among the various States of Europe: Germany, 410,000; France, 300,000; Austro-Hungary, 365,000; Russia, 225,000; Belgium, Holland Italy, etc., 80,000. In France the diminution in the production of this article was 132,000 tons..... At the annual meeting of the Ontario Co., N. Y. Agricultural Soc. lately held a Canandaigua, the following officers were elected for the year 1880. Pres., H. M. Boardman, Rushville; Rec. Sec., Jesse H. Mason, Canandaigua; Treas., L B Gaylord, Canandaigua; Cor. Sec., Geo. W. Johnson, Geneva. On hand, after paying all debts, $872.70.....The Maine farmers seem to have discovered that there is more profit in feeding their beets to stock than in selling them to the sugar factories at $5 per ton and buying back the pulp at $2. They are slow to make new contracts therefore.....We are told that among English farmers, 477 were bankrupt in 1877; 1815, '78, and 1,431 in '79....Holland has been suffering from floods, entailing immense losses, which, of course, fall heaviest on farmers.....Since his arrival in Havana, Gen. Grant has been enthusiastic in his praises of Florida. According to him, the peninsula will produce within a few years enough sugar, tobacco, and oranges to supply the United States and leave something over. But the sugar and tobacco people in Havana say that the Florida soil cannot produce the finer kinds of sugar and tobacco. The ex-President, however, is sure that the immigration from New England will remedy this lack, and he depends upon Yankee ingenuity to adapt the soil to the tobacco plant.....It is interesting, and to many people it may be profitable, to know the comparative value of different kinds of wood for fuel. Shellbark hickory is regarded as the highest standard of our forest trees, and calling that 100, other trees will compare with it for real value as fuel for house purposes as follows: Shellbark hickory, 100; pignut hickory, 92; white oak, 84; white ash, 77; dogwood, 75; scrub oak, 73; white hazel, 72; apple tree, 70; red oak, 67; white beach, 65; black birch, 62; yellow oak, 60; hard maple, 59; white elm, 58; red cedar, 56; wild cherry, 55; yellow pine, 54; chestnut, 52; yellow poplar, 54; butternut and white birch, 43; white pine, 30.. ....Trees grown on dry land are worth much more for fuel than those grown on wet land..... Much excitement around Amherst, Mass. on the reported sale by the Agr. College, of some Ayrshires infected with tuberculosis. Cattle sold in 1877; won two premiums since, lately found diseased. Farmers' Institutes and Clubs busy discussing the matter. .....The Mass. State Board of Agriculture has just protested against the threatened "gobblings up" of the Agr. Coll. by Amherst or Harvard, both of which colleges are not unwilling to take now what they tried for at its establishment. .. ....The Mass. Agricultural College estimates its real estate at $200,000; the farm stock at $2,747; implements and vehicles at $1,005; farm produce at $2,019; anticipated income for current year, $16,200; expenditures, $14,000.....About Greenfield, Mass. it is said farmers cannot afford to raise sugar-beets for less than $6 or $7 per ton of 2,000 pounds.... ... The largest recorded corn crop in Maine was last year raised by A. G. Thurlow, of Portland, for a $50 premium, offered by the Lewiston Journal—101 bushels on one acre, and, of course, 'twas a poor corn year too... ....Senator Hill, of Colorado has introduced and favors a proposition to appropriate $50,000 to the digging of artesian wells here and there in the plains of the West, for the purpose of proving that 500,000,000 acres may be reclaimed by irrigation, in this way. Private capital will, it is expected, then be invested in the business. Gen. Le Duc endorses the project.

Hints to Butter-Makers

is the title of a valuable little pamphlet, sent free to any address for one stamp. Address, Butter Improvement Co., Buffalo, N. Y. It tells you how to increase amount of butter from given amount of cream 6 per cent., improve quality of butter 20 per cent., make "gilt-edge" or goldon-colored butter the year round. Every farmer and dairyman should send stamp for it.

ONCHIAL, ASTHMATIC and Pulmonary complaints, "*Brown's Bronchial Troches*" manifest remarkable curative properties. Like all other meritorious articles, they are frequently imitated, and those purchasing should be sure to obtain the genuine "BRONCHIAL TROCHES."

Liver Coughs often taken for Consumption are cured almost instantly with Hop Bitters.

The Markets.

February; 33¾@34¾c. March; 36c. April; 37 May. OATS at 32½@32¾c. cash; 33c. February; 34c. March. RYE at 70c. bid. BARLEY dull and unchanged. HOGS—Light shipping at $4 15@4 25; packing at $4 20@4 35; butchers' to select at $4 35@4 50. CATTLE—Supply light and of mixed grades,

which sold readily al 10@15c higher; sales of light to fair shipping steers at $3 75@4 40; cows and heifers at $2 75@3 35; feeding steers at $3 90@4 30; receipts, 600; shipments, 1,300. SHEEP steady with a good demand; good at $4 40@4 80; prime to choice at $5@6.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 14, 1880

BEANS AND PEAS.—The demand for medium beans is not of winter volume and 50c. is not a frequent quotation. A very useful quality is offering at 40c., and with easy rates for potatoes grocers must have proportionately cheap beans. Marrows are in good export demand, and hold full last figures. Pea beans quiet. White and red in fair demand, the former rather scarce. Green peas firm at $1.75@1.80; business moderate. Southern B. E. peas per 2 bu bag, $2.25; marrow beans, prime, $1.70@1.75; other, $1.55@1.65; medium beans, prime, $1.45@1.50; other, $1.35@1.40; pea, 1.60@$1.70; white kidney, $1.60@1.80; red do., $1.55@1.75; black, 1.75@$1.80.
Receipts of beans, 3,800, exports, 1,600 pckgs.

BEESWAX.—Demand is limited to small lots, worth 24@25½c.; quoted for Western and Southern.

BROOM CORN—Dealings are small and prices unchanged. Quotations are for choice brush at 9c.; choice hurl at 8c.; stalk braid at 6@7c.; mixed red and green at 5@6c.

BUTTER.—The market has ruled quiet up to within a day or two, but with a better attendance of buyers and a falling off in receipts prices close strong, with an advance of 1 to 2c. ₽ ℔ The entire offering of State is not attractive, and outside prices are only attainable when fall excellence is positively perceptible upon the tryor. A fair portion of late receipts are farm-owned and have paid for holding to date. Low grades of State and Western have been neglected for a fortnight or so but now begin to move. Late shipments of western are reported as selling at a fair profit, say $1 to $2 ₽ firkin. Roll butter holds a better place than at our last. More fresh solid packed could be placed than arrives. The West used to be relied upon for this grade of stock, but the yield this season seems to get divided along the routes, and New York misses what could be handled. There will be a demand for rich grain-fed winter as long as best ends are broken off dairies to an extent that leaves doubtful graded bodies for the use of those who must, or what is just as good commercially, think they must have steady supplies of State. As cold weather prices are favorable for producers, we join with some of our contemporaries in urging farmers, whose land space permits, to plant more largely of corn with a view to the enrichment of winter butter, an item that is destined in the future to mean business. To-day it would be difficult to fill a large order strictly fine butter creamery or other packages. Western butter is not up to its winter quality standard and seldom exceeds inside figures.
State pails and tubs, full choice, 29@30c.; full, good to prime, 26@28c.; fair to good, 24@26c.; poor to fair, 20@24c.; fresh choice, 30@32c.; good to prime, 26@28c.; fair to good, 23@25c.; entire dairies, choice, 29@27c., good to prime, 24@25c. fair to good, 22@24c.; creamery, fresh, best, 37@38c.; good to prime, 33@36c.; fair to good, 30@32c.; poor to fair, 26@30c.; fall, 26@32c.; summer, 22@26c.; Western imitation creamery, 22@29c.; dairy fresh, extra, 24@26c.; good to prime, 20@24c.; fair to good, 21@22c.; poor to fair, 19@20c., factory, special grades, fancy, 23@24c.; prime, 20@21c.; fair to good, 18@20c.; poor to fair, 16@18c.; very poor 10½@12½c.; roll butter, 18@20c.
Receipts for week, 21,100 packages. Exports, 7,400 packages.

CHEESE.—Export demand is slack and the home trade moderate, but prices are held firmly,
Quotations for State factory: Strictly fancy, 14½@15c., choice at 14½c.; good to prime, at 14@14½c; fair to good, at 13½@14c. State farm dairy: Good to prime at 14@14½c.; fair to good at 13½@14c. Wis. factory: Fine, 14½@15c.; good to prime 13½@14½c. Ohio factory: Cheddar, fine, 14½@14½c.; do., fair to good, 13@14c.; flat, fine, 14½@15c. flat, good to prime, 14@14½c.; flat, fair to good, 13@14c.
Receipts for week, 6,050 boxes; exports, 2,800 do.
Liverpool cable, 73s.
Steam, 20s.

COTTON.—The market has been fairly active and closed at for February, 13 22@13.23c.; March, 13.29@13.30c; April, 13.53@13.54c.; May, 13.73@13.74c.; June, 13.91@13.93c.; July, 14.01@14.03c.; August, 14.09@14.11c.; September, 13 55@13.58c.; October, 12.04@12.77c.
Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS—Have had increased demand and closed generally higher. For apples—New North Carolina, at 7@8¼c. for fair to good; 9@9¼c. for choice; 10@10½c. for fancy sliced; New York State sliced, new, 7½@8c.; quarters, 6½@6c.; Southern and inferior scarce and nominal. Patent evaporated, apples, choice, in cases, at 13½@14c. for choice, and 12½@13c. for do. good and prime; evaporated peeled peaches, at 23@26c. for good to choice. do. unpeeled at 13@14c.; old North Carolina, 16@18c.; Georgia, 14@10½c.; Virginia, 12@15c.; old halves, unpeeled, 7½c.; do. quarters at 7c. Blackberries at 11c. Raspberries at 25c. Pitted cherries at 19@19c.
Exports of dried apples for week, 300 bbls.

EGGS.—Receipts for the week, 9,875 bbls.; do. last week 6,850 do. Lent is here but high prices have been ruling, and it is difficult for the market to suddenly assume the right sort of action. To make trade brisk consumers must have rated down a degree lower at retail than wholesale parcels are now quoted. Many retailers in this city have made it a point to sell eggs at this season very close to cost, so as to attract customers for other table goods. But as no item stands a high price in a retail way, as it use i to, eggs will have to take their chance with other commodities. Quotations will depend upon supplies and with the yet open weather prices are liable to fall any day.
Near points, per doz., 17@18c.; State and Penn., 15½@16c.; Western and Southern, fresh 15½; good marks, 14@12c. including Tennessee. State limed, 12@13c.; Western, 11@12c.; Canadian 12@12½c.

FLOUR.—There have been free sellers, and buyers have had the advantage without much activity. Quotations are $4.80@5.10 for poor to very fancy superfine State; $5.40@5.65 for inferior to good extra do., odd lots and lines; $5.65@5.90 for good to very choice do.; $4 80@5 50 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $5.40@5.65 for inferior to good shipping extra do., and $5.65@4.85 for good to very choice shipping extra do. Inferior to about choice white wheat extras $5.90@6.75; about choice to very fancy do. $6.75@8 the latter an extreme; red and amber winter wheat, inferior to very fancy grade and family, at $5.90@7.75; round hoop Ohio, $5.60@6; and trade and family brands of do. at $6.10@7.75; the latter rate for very choice; St. Louis at $5@6.75 for inferior to very good extra; $6.75@7.75 for very good to very choice; Minnesota clear, very inferior to fancy, at $5.65@6.75; Minnesota "straight," inferior to very fancy, at $5@7.75 and patent inferior to fancy at $6.75@8.75; unsound stock at from $3 00@5.50 city mill extra at $5.25@6.75 for ordinary to fancy for West Indies do. for England, $5.40@5.75 for poor to choice; do. trade and family extras, $6.75@7.75; do. for South America, $6.40@6.85; No. 2 at $3.90@4.75 for poor to very fancy.

CORN MEAL.—Sales at $3.75@3.80 for yellow Western, and $3 25@3.30 for Brandywine.

FRESH FRUITS.—The demand is steadier for apples and prices may work up if the weather will allow a push of stock to be avoided. Railroad stock turns out well. Boat lots run very uneven. Exports for week, 5,900 bbls. Choice Baldwins and Greenings ran c $2.50@3; poor to good $1.50@2.25; very fancy red $1.50 Strawberries arrive in mixed condition; Char. have sold at 15@25c. per qt.; Fla. 35@60c. Fla. oranges in fine order $3.25@4 half bbl. case; the latter for Indian River; stem picked Grapes nominal at $3.50@4 per case. Cranberries firm for bbls; crates higher. Cape Cod, bbls. $7.50@9; other Eastern, $6.50@8.50; N. J. crate, $2.37@2.87. Peanuts are hi. herbu; will hang at the advance: Va. hand-picked, 6c.; other kinds, 5@5½c.; shelled 5½@6c. Hickory nuts 75c.@1; Pecans, 10c.

GRAIN.—Wheat has had a stronger export demand at easier prices. Latest sales are of No. 1 white at $1.46@1.47½; do., February, $1.46½@1.47; do., March, at $1.47@1.47½; do., April, $1.47½@1.48; do. May option, at $1.45@1.45½; ungraded white at $1.42@1.42½; No. 2 red at 1.46½@1.48; do., February, at $1.46¾@1.47½; do., March, at $1.47¾@1.49; do. April option, at $1.48¾@1 50; do., May, at $1.48¾; ungraded red at $1.41@1.45; mixed winter at $1.45@1.46; ungraded amber Michigan at 1.46¾; No. 2 northwest spring at $1.40; New York No 2 spring at $1.38; New York No. 3 spring at $1.30@1.32; ungraded spring at $1.30. Rye at 95@96c. for prime. Corn is moderately active; latest sales are of old No. 2 at 59c. new afloat quoted at 58@59c.; do., February, at 58¾c.; do., March, at 55½@55¾c.; do., April, at 54c.; New York steamer mixed at 57@57½c.; do., February, at 57@57½c.; ungraded mixed western at 56¾@58c.; New York No. 3 at 56@56¾c.; steamer yellow at 59c. Oats are lower and moderately active; latest sales are of No. 1 white, at 50c.; No. 2 white at 47¾@48c.; No. 3 white at 46¾@47c.; New York No. 1 at 48c.; New York No. 2 at 47¾@47¾c.; do., February, at 47½c.; do., March, at 47c.; New York No. 3 at 44¾@47c.; ungraded white western at 49@50c.; ungraded mixed western at 47@47½c.; white State at 50c.; mixed State at 47¾@48¾c.; No. 2 Chicago afloat at 48c. asked.

HAY AND STRAW.—Receipts are moderate, demand liberal and prices strong. Shipping hay quoted at 75c.; retail lots at 80@85c. for medium, and 90@95c. for prime; clover at 65@70c. Straw at $1@1.05 for long rye; 65@70c. for short rye, and 55@60c. for oat.
Exports of hay for week 1,100 bales.

HONEY.—Clover comb quiet; strained in good demand. White Clover single comb, 17@18c.; larger pkgs. 14@15c.; Buckwheat 11@13c.; clover extracted, 10@11c.; strained, 8@9c.

HOPS.—The market is still unsettled, with demand slack and prices are wholly nominal. Quotations are for:

	Cents per ℔.
New York, fancy	38 @40
New York, new crop, good and choice	33 @38
New York, new crop, medium	31 @33
New York, new crop, low to fair	27 @29
Eastern, new crop	27 @35
Wisconsin, new crop	27 @35
Yearlings	7 @18
Olds, all growths	4 @10
Pacific Coast, new	30 @35
Pacific Coast, olds (nominal)	5 @10
Bavarians	45 @60

MAPLE-SUGAR.—A few lots of new Ohio quoted 15@16c.

OIL-CAKE.—Western is quoted at $33 per ton.

POULTRY AND GAME.—The weather has not been favorable for the few items in market, and prices are easy. Wild pigeons, per doz., flight, prime, $1 65@1.75; acorn fed, $1.50. Canvas back ducks, $2.25@2.75 prime Southern and Western; red heads, $1@1.25; Mallard, 75@90c.; Teal, 60@60c.; common, 30@40c.
Supplies have exceeded the moderate wants of the period; in fact, in cases good lots had to be put in cold storage. Large turkeys very slow.
Turkeys, Jersey, good to prime, 11@12½c.; State, Mich., N. Ohio and Penna., prime, 11@11½c.; other Western, prime, 10@11c.; fair to good, 9@10c.; Western, d.-p., 10@11½c.; Phila., d.-p., 12@13c.; Capons, Phila., large, 19@20c.; slips, small, 15@17c.; chickens, Pa. d. p., 12@13c.; Jersey, ₽ ℔., 11@11½c.; State prime, 9½@10c.; Western, prime, 8½@9c.; fair to good, 7@8c.; poor to fair, 5@7c. Georgia, Alabama, Mississippi and Louisiana—fine unwashed, 43@45c.; medium unwashed, 40@43c.; coarse unwashed, 30@33c.; burry, 18@24c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Feb. 14.

BEEVES.—Receipts for the week, 11,573 head; do last week, 11,073 do. The week has been a severe one upon sellers. Most of the stock was high bought at the West and trade here has not helped owners, but in scarcely any instance this week. This weather has been bad for several days; wholesale dealers in dressed not willing to risk carrying hides and quarters while damp muggy weather threatened, Lent also curtails the wants of many up-town shops. A serious decline in fat and hides has also a depressing effect. Take it in all it was as poor a week as has occurred in New York for many months. Poor to fair steers sold at 7¾@8c.; dr. 55@5dc.; good to choice, 9¼@10¼c. dr. 56 ℔s.; extra quality 10¼@10¾c. dr. 57 ℔s. Export demand fair for selected stock.

MILK COWS.—Sales have again been reported at $35@$55 per head, good to prime milkers. Supplies continue ample for all wants; common cows not looked at.

VEAL CALVES.—The demand has ruled moderate but prime lots of live have brought fair prices. N. J. and Bucks Co. choice, 8@8½c.; others, 6¾@7¾c. Mount Holly, 5@8c. dressed calves very dull, will be riskey property during Lent. There is a wide range on under goods.

BUTT-MILK CALVES.—4¾@5c.; grass do. 3@3¾c. Hog dressed choice, 10c.; good 8¾@9¾c.; poor to fair, 4¾@8c.

SHEEP AND LAMBS.—Receipts for week, 27,336 head; do. last week, 29,741 do. The market has been dull and inactive, 5¾@6c. for sheep and 7¼@7¾c. for lambs.

SWINE.—Receipts for week, 30,843 head; do last week, 32,493 do. Live, steady at 4¾@5c. County pork light at 6¾@6¾c.; medium 6¾@6½c.; heavy 6@6¾c., tenderloins, 9c.

MAMIE'S WISH.

I WANTS a piece of talito
To make my doll a dess,
I doesn't want a bid piece,
A yard'll do, I gess.

I wish you'd fred my needle,
And find my fimble, too,
I has such heaps of sewing
I don't know what to do.

My Hepsy tored her apron
Tumbling down the stair;
And Cæsar lost his pantaloons,
And needs annozzer pair.

My Maud needs a new bonnet,
She hasn't none at all,
And Fred needs a new jacket,
His ozzer one 's too small.

I wants to go to Ganma's,
You promised me I might;
I know she'll want to see me,
I wants to go to-night.

I wants some newer mittens,
I wish you'd knit me some,
For most my fingers freezing
These leak so at the fumb.

I wish I had a cookie,
I'm 's hungry as I can be:
If you hasent petty large ones,
You better give me free.

REMINISCENCES OF A LITTLE GIRL.

MRS. M. J. GALPIN.

I SEE by the Rural that Uncle Mark has published my letter promising the little ones a story. I suppose I must make a commencement and see what I can do for you in the role of story teller; but before proceeding any farther, I will say to the little ones, that they can hardly depend on my regular appearance every week, as I have no opportunity to write except at night when my three children are in the land of dreams, and I keep no help whatever, having always found them more trouble than gain. I will try and use language so plain that you may all understand, but if I fail, call on your papa or mamma to help you out of your difficulties.

How shall I commence? Once upon a time when geese were swans, or how shall it be? Well, I will take you back some forty-five years and tell you something in regard to this little girl's father, and after awhile we shall see where she comes in. You will, also, journey with me across the Atlantic Ocean to the town of L——, Galway Co, Ireland. Within that town lived a famous linen weaver, one who wove the splendid Irish linen and linen damask, now so much admired. He was the father of thirteen children and was always so upright in his conduct, that he was dubbed "honest Tom Silk," people would believe his lightest word, more than some men's solemn oaths. He stood six feet two inches in his stockings, and was as straight and upright in stature, as he was in character. The prevailing religion in Ireland then, as now, was Roman Catholic, and he was faithful and strict in all his observances of the church rules. It was the custom in those days to select one of the children of the family for the priesthood, and the choice in this family fell upon the father of our little heroine. Little Tommy Silk left his home to go and live with Father B. and learn the way to the "Kingdom of Heaven," through the priest's hands. He became his help in all things, attended to the vestry, looked up the chapel, saw to the priest's robes and vestments, and swung the censor at the burning of incense during mass and vespers. In fact, one of those young embryo priests; made a first-class "chore boy," while the deluded parents thought it a fine thing to wait on His Honor, the priest. The rest of the family urchins were always jealous of the favored one, and frequently twitted him with being what we call "lony" on account of his being the priest's favorite. Matters glided smoothly by with little Tommy Silk until his 14th year, when an event occurred which deeply affected his ardent young spirits, and to his dying hour he always believed in the reality of what then took place. One evening while at the chapel and going through some religious penance, he was attracted by hearing a noise at the east window. On looking up he saw what appeared to be a beautiful child, clothed all in white, with long golden curls floating over its shoulders, the noise Tommy heard was caused by the rattling of a small table that stood beneath the window, there was nothing of the child visible below the waist. Tommy always said he never before or after in his life saw so beautiful a face. While gazing at it with wide open eyes, the child beckoned to him slowly with its hand to come to him. Tommy started to obey, but, after taking a few steps, terror took possession of him and he fled from the chapel. On gaining the outside of the inclosure, he asked the old woman whose duty it was to dust and see to the church, if she had locked up or seen any child around the church. He told the priest of his adventure, but on the strictest inquiry no tidings could be found of any such child, or anyone whatever around the church.

In those European countries it is customary to have the graveyards around the churches; hence the term church-yard, as applied to cemeteries now.

After thinking the matter over, his Reverence concluded it must have been an angel vision, and ordered Tommy to say a certain number of prayers in the chapel every evening, until fourteen days had passed; then, if the angel came and beckoned to him, to go and see what he had to say. Tommy said the prayers and only missed once, but the angel vision never reappeared. Spiritualism was unknown at that time, at least in Ireland, but still the priest and Tommy always believed that the child was supernatural. Now, I don't believe in ghosts or apparitions of any kind, yet I am often inclined to believe with Shakespeare, that "there are more things in heaven and earth than are dreamed of in our philosophy." From the day of his angelic vision, Tommy was an altered boy. He became devoutly religious, and studied in his books with increased ardor. The good old priest spared no pains in giving his little charge all the information and attention he required. Let me say here that priests were both a blessing and a detriment to the Irish. So long as the masses of the people were unlettered, it was a good thing that they possessed a leader with education and influence, one who could go to a fair with a "black snake" and whip the riotous ones into order. I tell you, dear children, you ought to thank God that you live in the glorious light of the nineteenth century; for the world has progressed greatly since the days of which I speak. On the other hand, Catholicism was detrimental, because it was opposed then, as it is now, to free and general education. The poorer classes never dreamed of learning how to read or write, all that was left for his reverence to attend to. The fact that Tommy's family were pretty well educated for those days raised them "way up" in the social scale. Tommy remained with Father B. from childhood until he was 16 years old. He then went to live with the bishop of the diocese, which was still a step higher, and a preparatory stride toward the time when he should take the sacred vows and become a priest. He found the bishop a stern, unyielding man; one who had little charity toward the shortcomings of others, and visited any misdemeanor with heavy punishment. Tommy's recollections of him in after years were always bitter, and I often think older people are not careful enough about the impressions they leave on the young and tender minds entrusted to their charge. Our young friend lived with the bishop for over two years, when he was sent to live with another bishop in the city of Limerick. Tommy was about 18 years old and had attained his full stature and looked some years older than he really was. While living with Bishop S. he took upon himself the vows of celibacy and prepared to follow the footsteps of all the other priests who had lived and died without wife, children, or any of those ties that bind and endear the human family to each other. But fate was unrolling a panorama for him of which he had never dreamed. A shy, sensitive, loving boy, he thought there was no power that could swerve him from the path of rectitude, or cause him to forget and abjure both his faith and his vows. But so it was ordained. The power of love was to be the magnet that would make him forsake all else and cleave unto the idol of his heart. One evening, while assisting in serving mass, he was attracted by a beautiful face which seemed the embodiment of everything that he thought lovely. The services lost their charm and became a confused mass in his youthful brain. The attraction seemed mutual, for the woman seemed to admire him as much as his glances showed admiration for her. And right here in the holy church is where the evil one, according to Catholic doctrine, commenced his temptation; though for my part I cannot see what wrong there was in two people loving each other as they did afterwards.

For weeks they remained silently admiring each other; the woman not daring to think of a man consecrated to the priesthood, and the man held back by his vows, his honor and all things else combined. They say that "love laughs at difficulties," and it was so in this case. Like Mother Eve tempting Adam, the woman broke the ice of reserve by talking to him one evening when they were coming from vespers. I have often heard Uncle Tommy tell how he felt when she first spoke to him. He said a chill passed over his frame and then every fibre tingled as with an electric shock. Neither of these young ones dreamed at that first acquaintance that they would brave everything to become one. Nor of the care, persecution and sorrow lying ahead in their pathway. What a blessing, dear children, that we cannot see into the future. Never let any of you wish to raise the veil, but believe that "as the day so shall thy strength be," and wait in patience for the unfolding leaves of the future to produce what may be in store for you, be it either hope and joy, or care and sorrow; remembering always that our Heavenly Father "doeth all things well." But now I shall close for this time. I will follow Tommy and his fortunes in my next, and later tell you how my little heroine appeared on the scene, and what her life was in after years. Hoping my tale will interest you, I now say goodnight, to one and all.

May holy angels guard thy slumbers,
Linger round thy lowly bed,
May the morning break with sunshine,
O'er each little sleeping head.

Marshall Co., Kansas.

ROTHCHILD'S MAXIMS.

ALL of the cousins must have heard the name Rothschild mentioned, the name of one of the wealthiest families in the world; and some of them are perhaps also familiar with the story of how they acquired their colossal fortune. The father of the family, Mayer Anselm Rothschild, was born in Frankfort, in Germany, in 1743, and died in the same city in September 1812. He belonged to a poor Jewish family. While a young man he was employed as a clerk in Hanover, but later in life he established himself in his native town, where he opened a banking house. His integrity and ability brought him into business connection with several of the German governments, and particularly with that of Hesse-Cassel. In 1806 the French invaded the latter State and put the ruling prince, William I, to flight. But before leaving his country, he deposited $5,000,000 for safe keeping with the honest banker Rothschild, who was permitted to use the money without interest. By judicious investments of this sum, Rothschild laid the foundation for the present wealth of the family, and although the whole amount was later paid back to the heirs of William, the banker had reaped a hundred fold from its use. Mayer Anselm's five sons, Anselm, Solomon, Nathan, Charles and James, respectively became chiefs of banking houses at Frankfort, Vienna, London, Naples and Paris, and all were made barons by the emperor Francis. The eldest son of Charles, Lionel Nathan, in due time became the head of the London Rothschild firm, and it is he, who, according to George Francis Train, had the following maxims framed and hung on the walls of the bank.

Attend carefully to details of your business!
Be prompt in all things!
Consider well, then decide positively!
Dare to do right! Fear to do wrong!
Endure trials patiently!
Fight life's battle bravely, manfully!
Go not in the society of the vicious!
Hold integrity sacred!
Injure not another's reputation or business!
Join hands only with the virtuous!
Keep your mind from evil thoughts!
Lie not for any consideration!
Make few acquaintances!
Never try to appear what you are not!
Observe good manners!
Pay your debts promptly!
Question not the veracity of a friend!
Respect the counsel of your parents!
Sacrifice money rather than principle!
Touch not, taste not, handle not, intoxicating drinks!
Use your leisure time for improvement!
Venture not upon the threshold of wrong!
Watch carefully over your passions!
'Xtend to every one a kindly salutation!
Yield not to discouragements!
Zealously labor for the right!
& success is certain!

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—As I am a member of the club I thought I would write and tell you of my summer's work. My D. D. corn might have proved as great (in name but not in size) a curiosity as papa's "Blount Corn" had it lived; but something always does happen on a farm. The pigs with their piggiest appetites broke in and and left it a total ruin one day, and I did not save enough to plant next year. I had a nice patch of water-melons and a pretty flower garden with Morning Glories, Pinks, Pansies, Portulaca, Cockscomb and Zinnias in it. Our farm consists of 65 acres; it is three miles from Madison, and is about 30 rods from a school-house. Papa has a good many grapes on a sunny slope facing the south. But these long evenings we cannot spend in the garden, so let us all try and make our corner a bright and pleasant one. Come cousins every one of you. Don't get to nodding, we want to hear from you all. I will tell you how to make a little face that looks real funny when done. Put the end of your thumb between the two middle fingers, in a line with the knuckles and then take two black shoe buttons, and place one on each side of the knuckles above. Then take a handkerchief and cover the whole hand except said features. If done nicely and brought into a room full of company, it will make lots of fun. I have one other amusement I would like to speak of, and then I must close. First, boil some red cabbage in water until the liquid becomes real blue; then put ten drops of dissolved soda in one wine glass, an equal amount of dissolved alum in another, and 10 drops of vinegar in a third. Fill the glasses with the cabbage water; if strong enough the mixtures will take beautiful colors, green, red and purple. Well, I guess Uncle Mark will get tired if I write any more.

Madison, Wis. "COUSIN NONSENSE."

DEAR UNCLE MARK:—We once again write to you. We can't tell you much about our flowers, for we have but very few now. We have three Geraniums, a Rose, and the other two we don't know the names of; we only got the slips last fall and they are small yet. One plant has been in constant bloom since last October. We have three Salvias, one Star plant, and two kinds of Ivy. This is the first winter we have ever tried to keep flowers in the sitting room, for all our plants stay in the ground in winter. We have always a good many animals. Mamma says we may have our flower beds this summer each by herself, then we shall see what success we will have. Perhaps we then may have something interesting to write about. We are only three little girls and can't write as well as some of the other cousins. O! Uncle, we came near forgetting to tell you about our grape seed. It was planted as you directed, but none of it has sprouted yet. No cold weather this winter. As the paper is full we will close.

Yours, &c.,
LIZZIE, BARBARA AND ELIZA POUND.

Spencer Co., Tenn.

DEAR UNCLE MARK:—I am a little boy, 11 years old. My father takes the RURAL, and we all like it very much. We have a farm of 40 acres. We keep three horses and 11 head of cattle, and five pigs. We have sowed seven acres of wheat and three-quarters of an acre of rye. My father thinks he will plant 10 acres of potatoes next summer. We have had a very moderate winter so far. I go to school every day. My teacher gave me two presents for being the best boy in the school. Please print this letter, for I am a little boy and I want to see it in the next paper.

Your little friend, LOUIS A. TUTHILL.

Orient, L. I.

DEAR UNCLE MARK:—I would very much like to join the Horticultural Club. I would have written before but I was afraid you heard from too many. I have one sister and three brothers. Their names are Mary, Fred., Walter and Harry. This summer I had a very nice garden. Mary's and mine are where a stable used to stand, so the ground is very rich. I had Geraniums, Feverfews, Sweet Williams, Balsams, Pansies, Indian Pinks, Mignonette, and Marigolds. I hope this letter is not too long to print. From your niece,

MAGGIE C. DOOLITTLE.

P. S. I will be 11 the 7th of next March.

Knox Co., Ohio.

DEAR UNCLE MARK:—As I have not seen any letters from this place, I thought I would write. I am 11 years of age. I love poultry; I have a duck that lays black eggs. I have a dog also that weighs 75 pounds. I have also a little dog which we call Tilden. He is not, however, related to Sam. J. Tilden. Besides these I have about thirty fish in a little cistern. I must not make my letter too long. WILLIE J. SHANER.

DEAR UNCLE MARK:—Will you please let me join the Horticultural Club? My little brothers—Deville and Ronald—send their names, too. We all love flowers very much, and have a pretty garden every summer, but Deville says he likes to cultivate vegetables best. We go to school and have not lost a day this winter. It has been very warm here since New Years. RENA VIOLET.

Bucklin, Linn Co., Mo.

Sabbath Reading.

THE PRESENCE OF THE SAVIOUR.

THE presence of the Saviour,
How it brightens all my way,
How it helps me, how it strengthens,
How it cheers me day by day.

The presence of the Saviour,
How it makes the darkness light,
How it brings a ray of sunshine
Into sorrow's dreary night.

The presence of the Saviour,
How it fills the longing heart,
With a sense of deep, sweet gladness
Nothing earth-born can impart.

The presence of the Saviour,
How it chases every fear,
How it soothes the restless spirit
When faith feels that He is near.

The presence of the Saviour,
And the knowledge of his love,
How it seems a sweet, bright foretaste
Of eternal joys above.

The presence of the Saviour,
Surely it is heaven begun,
For 'twill be the brightest glory
Of the life beyond the sun.—J. S.

GOOD OUT OF EVIL.

GOD is kinder to bad men than they are to themselves. Often He surprises their evil intention with unexpected good, and shames them into repentance with a blessing.

An Arabian vine-dresser in a time of war was drafted into the Turkish army, and forced away from his peaceful home in the mountains to a life of hardship and violence. Rough experience and example soon made him like all the rest of the Mussulman soldiers, ferocious, reckless, and insensible to any higher duty than fighting and plundering.

While the troops with which he served were out on one of their destroying expeditions, they entered a district inhabited by people whom the Turks considered their political enemies, and attacked a Christian village. The terrified families fled, and the invaders ransacked their houses seizing everything they could carry away. The Arabian soldier was fond of books, and, took care to secure several with his other booty, paying no particular attention to what they contained.

It happened that one of the books was a Bible. He found little opportunity to read till the excitements of camp and field were over; but when he was allowed to go home he took the stolen Bible with him, and as soon as he had examined it he felt interested enough to read it through.

No doubt the rightful owners, while they mourned their other losses, prayed that the Good Book might reform the thief who took it away. Certainly such a wish could not have been more happily realized.

The man continued to read with increased attention, and as he went on he said, "This book is better than the Koran." From wondering at the book he began to wonder at himself. His conscience was awakened, for he learned all about his own heart. The Bible showed him his guilt and led him to penitence; and then it taught him to pray, and to whom to pray. He bowed to the Redeemer revealed in the New Testament, and acknowledged Him as the Friend whom he needed.

His family were enraged when they knew that he had "turned Christian," and their reproaches and persecutions made his home a house of torment. His neighbors hated him for an "apostate," and insulted and denounced him, and even mobbed him in the streets, and destroyed his vineyard and fruit-trees. The poor man was a social outcast; but it was for the sake of a religion whose blessings more than paid him for all earthly spoiling and shame. Nothing could shake his heroic faith. When he was in his extremity the kindness of an English Protestant minister gave him employment, and a refuge which no Mussulman dared to violate.

At the writing of this sketch—three years from the time when he began to read that stolen Bible—the persecuted Arabian vine-dresser is a Christian preacher in a Syrian village on Mt. Lebanon, and pastor of a church which numbers among its members many of those who were once his bitterest revilers.—*The Watchman.*

PERSONAL ITEMS.

Francis Otero Gonzales, the man who tried to kill King Alfonso of Spain some time ago, has been sentenced to death.

The cabinet has considered Maj Reno's case and determined to let him tender his resignation, which will be promptly accepted.

THE publisher of the Chicago Inter-Ocean gives, in that paper, the following unsolicited testimonial, which speaks for itself:

Office of THE INTER OCEAN, *Chicago, Jan.* 10, 1880.

DRS. STARKEY AND PALEN.--*Gentlemen:*—It is contrary to my rules to give certificates to the many healing remedies that are advertised, but my experience with Compound Oxygen has been such that I feel it my duty to recommend it to all my acquaintances suffering from overwork and a tendency to pulmonary trouble. In October, 1878, I was in very poor health. My system had been much overtaxed, and a cold contracted in the spring seemed to have taken permanent hold on my lungs. I had had several slight hemorrhages, was troubled with a cough, and was much reduced in flesh. I was discouraged and my family alarmed at my condition. A friend in Boston sent my wife one of your little books, strongly recommending your remedy. I was besought to order the Home Treatment, and did so. I followed instructions faithfully, and in three months was a new man. My troubles had almost entirely disappeared. The improvement had been quiet, but certain and sure from the time I first began its use. I feel very grateful to you for it, and wish that I could persuade all suffering in a similar way to perseveringly use your simple and effective remedy. Business is very confining and exacting, and when I take cold and feel myself running down, I resort to compound Oxygen, and it is always prompt in its results. I feel like commending it to all. It is not a kill-or-cure remedy. If it does not cure it surely does not injure. Yours truly, WM. PENN NIXON.

Our treatise on Compound Oxygen, Its Action and Results, *sent free.* Address DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

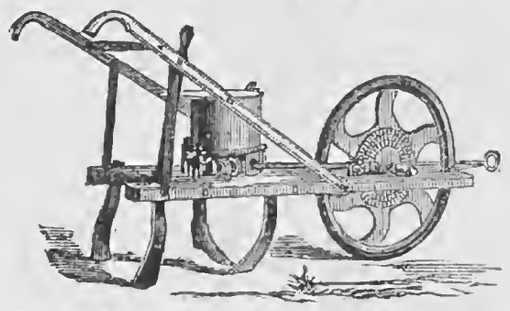
HOOSIER CORN DRILL!
60,000 IN USE.



Drops, with great regularity, one grain in a place, either 12, 16 or 20 inches apart, does the covering uniform in depth, and is both time and labor saving. A given area of corn planted with this machine contains as many plants as when hilled, but their arrangement is such that *each* plant has access to the *same* amount of plant-food that must necessarily be *divided* between from 3 to 5 plants when huddled together in a *hill.* Hence a healthy start and vigorous growth of the plants and the consequent production of **large, well matured ears,** by which the quality is improved, and the yield increased from 10 to 20 bushels per acre, over hill planting are natural results following the use of our **Corn Drill.** Send for circular.

BRIEFLETS.

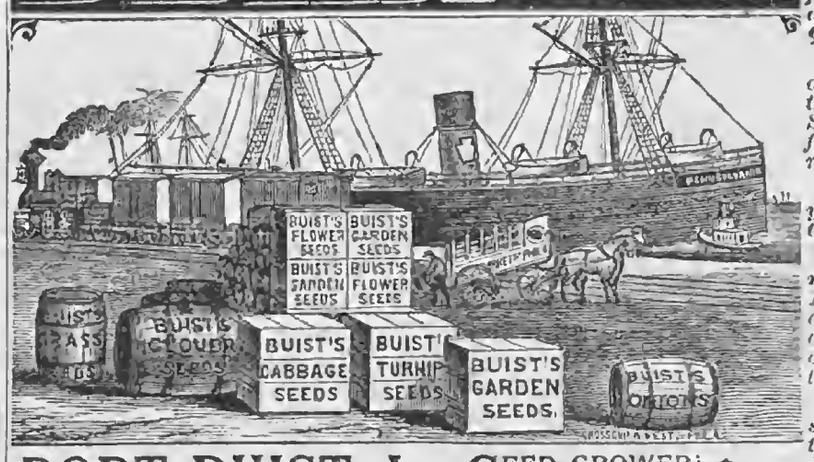
EARLY PEARS.—Madeleine, ripens late July; medium in size, of juicy, melting, refreshing flavor. Summer Doyenné, more productive. . . Few men are so little given to fault finding as those who despise human nature too much ever to quarrel with it. . . "I cannot say," remarks a writer in Truth, "that I abhor Lord Beaconsfield's political principles—for I never perceived a trace of his having any." . . The roundest of pegs in the squarest of holes. . . Alcohol cuts down youth in its vigor, manhood in its strength and age in its weakness. It produces weakness, not strength; sickness, not health; death not life. It makes wives widows, children orphans, fathers fiends, and all paupers. It feeds rheumatism, nurses gout, welcomes epidemics, and embraces consumption. It covers the land with misery, idleness, and crime. It engenders controversies, fosters quarrels, and cherishes riots. It crowds penitentiaries and furnishes victims for the scaffold. It is the blood of the gambler, the element of the burglar, the prop of the highwayman, and the support of the midnight incendiary. It countenances the liar, respects the thief, esteems blasphemy. It violates obligations, reverences fraud, honors infamy. It defames benevolence, hates love, scorns virtue and innocence. It incites the father to butcher his helpless offspring; and the child to grind the parental axe. It burns up men, consumes women, detests life curses God, and despises heaven. It suborns witnesses, nurses perfidy, denies the jury-box, and stains the judicial ermine. It bribes voters, disqualifies votes, corrupts elections, pollutes our institutions, and endangers the government. It degenerates the citizen, debases the legislator, dishonors the statesman, and disarms the patriot. It brings shame, not honor; terror, not safety; despair, not hope; misery, not happiness; and with the malevolence of a fiend, calmly surveys its frightful desolation; and, stained with havoc it poisons felicity, kills peace, ruins morals, wipes out national honor, then curses the world and laughs at its ruin. It does that and more—it murders the soil. It is the sum of all villainies, the father of crimes, the mother of all abominations, the devil's best friend, and God's worst enemy." Col. Ingersoll. . . Just inquire how many strictly temperance people are in favor of "horse trots" and "speed rings" at agricultural fairs. . . PROBLEM: If God made the country and man made the town, who made New Jersey? . . The Illinois Board of Agriculture (?) votes $1,700 to a *speed* ring for the next fair—and this, so far as we learn, for the love of it! We hope that *agriculturists* will keep away and that horse jockeys will monopolize the ring and have things all their own way. Farmers, you set a pernicious example to your sons; you place them under one of the most alluring and harmful of influences by supporting the *speed* ring and it is no less evil because carried on under the agricultural tent!

Help in Time.

Help to be effective should be timely. When the kidneys grow inactive, as they are apt to do, it is wise to lend them and the bladder early and judicious medical aid in performing their very important functions. The requisite energy is infused into their operations, without danger of exciting them, and with great benefit to the general health, by using Hostetter's Stomach Bitters as a diuretic. Powerful stimulants are rather calculated to injure than benefit the kidneys and bladder, but this reliable promoter of energy imparts to them the requisite amount of impetus and no more. It should be remembered that kidney and bladder complaints in an advanced stage of development, very frequently baffle medical skill and prove fatal. To guard against disastrous consequences, repel their advance by the means suggested.

A MARKED CONTRAST.

BUIST'S SEEDS PRIZE-MEDAL FOR ALL COUNTRIES



ESTABLISHED 1828.

BUIST'S Seeds are celebrated in all the markets of the world for their Purity and Superior Quality.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXIX. No. 9.
WHOLE No. 1570.

NEW YORK, FEB. 28, 1880.

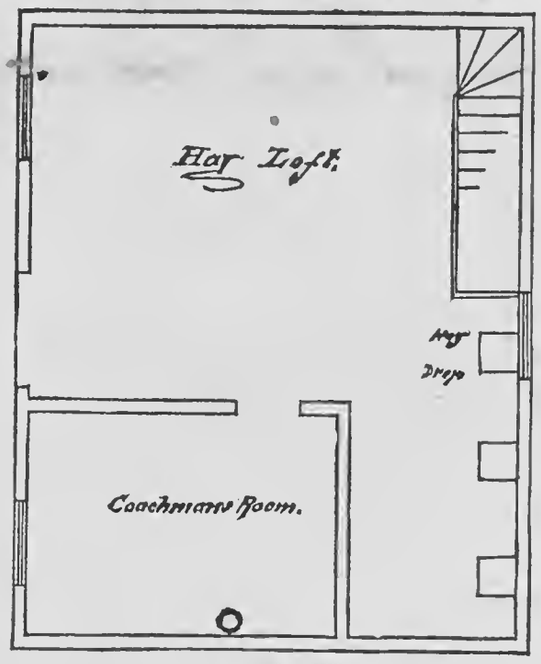
PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Rural Architecture.

A CONVENIENT BARN.

IN building a barn the first aim should be to make it snit the pnrpose for which it is needed, the second to make it ornamental to a degree corresponding with the snrroundings, the taste of the owner and his means. With these ends in view, the accompanying design was drawn. It was originally intended to erect a barn after this plan at the RURAL GROUNDS, but "circumstances alter cases," and for reasons quite independent of the model, we were finally led to adopt another plan which in some respects seemed to be more suitable. This design is, however, the result of careful study, and we present it here in the hope that it may be of service to some of our readers. It is not, of course, adapted to the requirements of a farm, but rather to that class of country places where the number of the larger domestic animals is limited to a carriage horse and one or two cows. It is drawn on a scale of one-eighth of an inch to the foot, except the plan of the loft, fignre 59, which is redneed

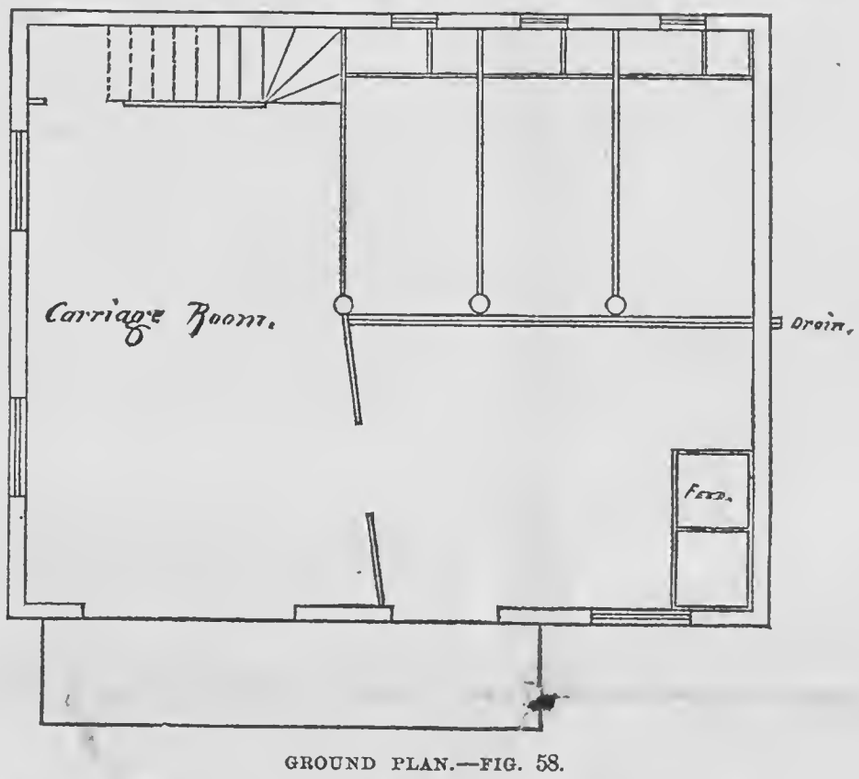


BARN LOFT.—FIG. 59.

somewhat. The arrangement of the stalls, etc., can be changed to suit the requirements of the case. The section drawing to the left of the elevation is intended to show the relative hights of the two floors, and the position of the windows. Instead of the pigeon house on the roof, a weather vane can be erected, if desired. The plans may so readily be understood that no further description is needed. A barn of this description can be built for $400.

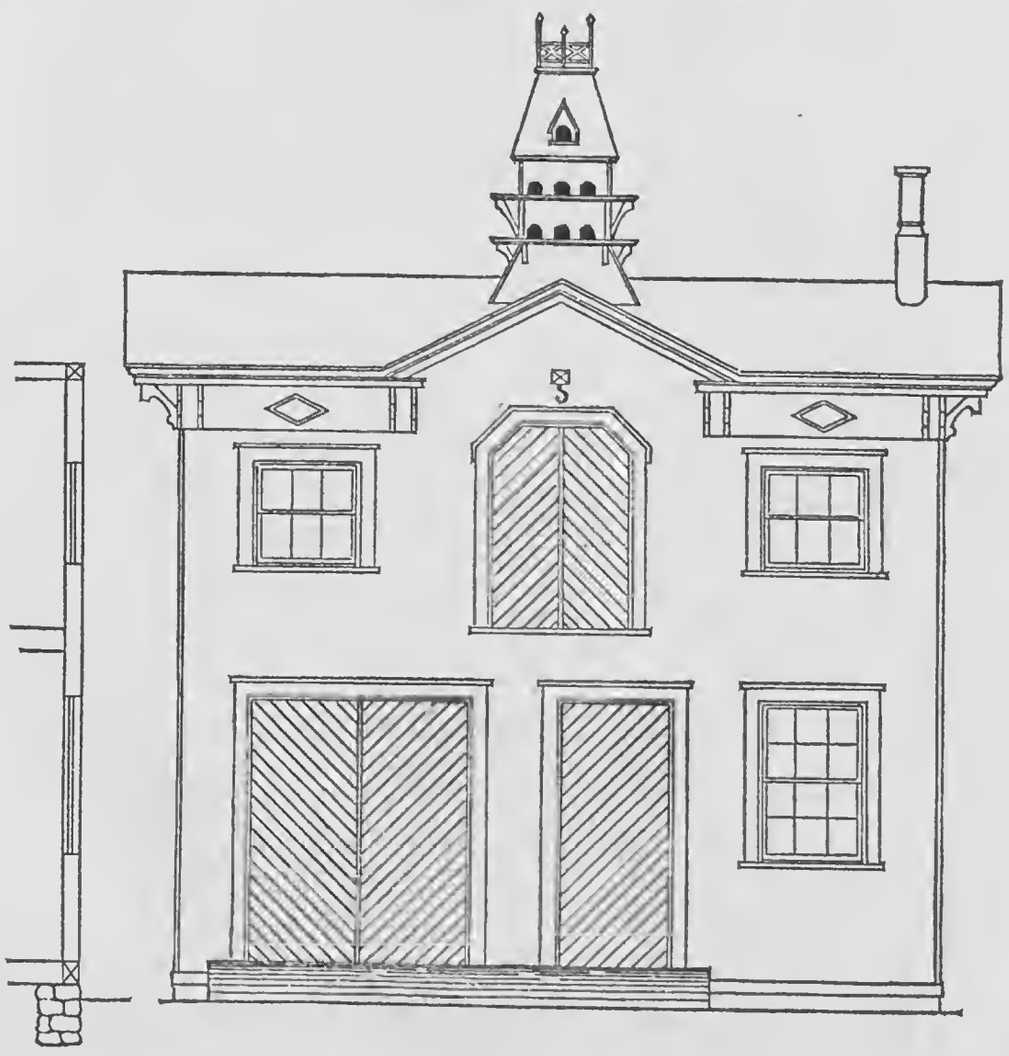
ICE-HOUSES.

THE essential requisites for a good ice-house are:—non-conducting walls and roof, drainage and ventilation, and the chief object of a person building a house should be to secure these ends. The best and cheapest material for ordinary ice-houses is lnmber, and of this probably the best is hemlock plank. The building may be entirely above ground or partly underground. The sills should rest on a stone or brick foundation to secure as much dryness as possible, and this had better be laid in cement A tight or cemented floor should be laid slightly inclined, with a drain at the lowest end to carry off the water. On this rails should be laid and covered with straw to support the ice. The walls and roof should be double-boarded with a space, between the inner and outer walls, from four inches to two feet wide—the nearer it approaches the latter size, the better. This space should be filled with spent tan bark, planing-mill or carpenter's shavings, or sawdnst. By charring the sawdust it is rendered nearly indestructible, while the uncharred article is perishable, and conducive to the growth of fungi which will soon cause the boarding to decay, so that the advantage from this measure amply repays the trifling cost. An air-space may also be left with advantage between the outer wall and an outside weather-boarding. The eves of the roof should extend a good way beyond the sides of the building. The gable end should be towards the north and is the best place for the door. For this purpose a common door will do for the outside, but within, instead of another door, a better arrangement would be a series of boards to fit horizontally between cleats in the door posts. A few auger-holes or a sliding shutter or similar device should provide ventilation from aloft at the north end. It is better and cleaner to pack the ice in ice than in sawdnst, so that the house should be filled as closely as possible. Its size of course must depend on the requirements of the builder, but the larger it is the longer will the ice be preserved if properly packed in a suitable building. A structnre of this kind can be built very cheaply, if a man does a good share of the labor himself; or bearing in mind the essential requirements—non-conducting walls, drainage and ventilation from above—even a cheaper one may be constrncted by any man with a fair average of gumption.



GROUND PLAN.—FIG. 58.

The accompanying cut represents a sectional view of an ice house for keeping meat, fruit, or indeed anything that requires a low temperature for its preservation. A, is the storage room into which the cold heavy air from the ice chamber, B, descends. As cold air is heavier than warm and consequently desends to replace it in a confined space, by having the ice over the store-room the same advantage is secured that has led to a similar arrangement in our refrigerators. Bearing in mind the above conditions, the construction of the building is readily seen from the engraving.



BARN FOR A VILLA RESIDENCE.—FRONT ELEVATION.—FIG. 57.

Farm Topics.

WESTERN FARMING—GENERAL OUTLOOK.

W. I. CHAMBERLAIN.

The styles of farming vary greatly in different parts of the country, and the wide-awake farmer of one State or region can hardly travel through other sections without seeing much to instruct, as well as interest and amuse. If he is a Western man and travels through portions of New England for the first time, the fields look exceedingly small and crooked, and he wonders where the farmers find room to turn around their machines and wagons. He is not at all surprised to find ox-carts in vogue, and wagon-racks for wood and hay so made that the wagon can turn aronnd, like a city truck, without moving one hind wheel, and he says, "Why of course! or else they'd have to drive out of the field to turn around at all!" He admits, for he must, that the valleys of Vermont and Connecticut are fertile and that the great hills furnish fine pasturage far up their slopes; but he says he doesn't like the land set np edgewise "like you were going to cultivate both sides."

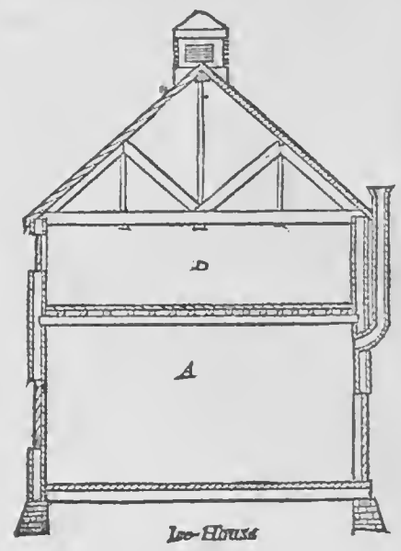


FIG. 60.

When he passes through parts of Massachusetts and New Hampshire and sees the small, angular fields, snrrounded by strong stone walls, every stone of which was picked or pried or blasted from the narrow inclosure, he fairly groans with sympathetic back-ache as he thinks of the immense labor required to clear a single acre and render it not half so valuable for tillage as an acre of unbroken virgin prairie. And he says to himself "If the Lord had put Illinois on the sea-board and New Hampshire beyond the great lakes, the latter never would have been settled." But when he sees the sagacity and thrift of the farmers and notices how they have, by a wise husbanding of all Nature's fertilizers, changed rugged and almost barren wastes into fertile fields, he feels that he has learned a lesson. And when he talks with the farmers and finds them intelligent and moral, as well as snug and tidy in person, farm and buildings, forehanded as well as shrewd, and remembers that Boston and Hartford loaned much of the money to build and rebuild Chicago, he admits that New England at least makes men, and that if Providence *had* put Illinois where *he* was just proposing, the Puritans would never have been the rugged sires of so many stalwart generations.

On the other hand, the New England farmer returns from his first trip to the Great West with enlarged views. That is the place where things are done in the large. The vast fields of grain, herds of swine and "bunches" of cattle, the many complicated labor-saving farm machines and the profuseness with which Nature fairly tosses her rich gifts into the lap of the

husbandman, make his own farming look small and hard. He can raise as many bushels per acre, perhaps, but he can hardly till a tenth part as many acres. He produces good crops, but at immensely greater cost, and only by the most scrupulous saving of fertilizers and the most thorough tillage. But he at heart dimly feels that this necessity for diligence and care has made him stronger in body, mind and heart, and that, on the other hand, the very profuseness of Nature at the West tends to lassitude and negligence, physically, mentally and morally. And he returns home determined to profit by his enlargement of views, indeed, but to make the most of those social and moral influences that surround and beautify the rugged life of the New England farmer.

It is curious how the farming of any given region seems to fall into some mold or rut. The shrewder farmers find what kinds of farming on the whole pay best in their locality, with their soil, climate and markets, and all the rest follow suit. Everything, too, is done in a certain way. I remember noticing this particularly one of the first times I visited the Eastern States. It was in August, and in the fine region between Harrisburg and Philadelphia for miles it seemed as if all the farmers, by common impulse, or by special telegraphic dispatch from some "team dispatcher," had that Tuesday morning begun to plow for wheat. They were all striking out lands, and they all did it in exactly the same way. In each field three tall "sighting stakes" were set in exact line where the first furrow was to be struck. Each stake had a small white rag tied near its top and fluttering in the wind to catch the eye. Each plow was drawn by three horses, two abreast and a "leader." On each leader sat a small boy, and woe to him if he didn't ride his leader in a "bee line" for those distant fluttering rags. Each team plowed forth and back, and then set its stakes for a new land and turned the "back-furrow" in the same way, and so on till the whole field was "struck out." As the day advanced some had finished striking out, and dismissed the leader and the small boy, to the intense relief of the latter, and began to plow on the lands. But they were all at it, and at about the same stage of the operation; and as the train sped on one could almost imagine he was in fairy land, and that man, plow, team, leader, small boy, stakes and fluttering rags of white, were all borne on and on with the rushing train.

Nearer Philadelphia the farming gradually changed more to "butter farming" or "milk farming" or "truck farming" and gardening; and so on past Philadelphia and through New Jersey. For a while all the men would seem to be setting strawberry plants, then all were digging sweet potatoes or picking peaches or melons or gathering cabbages, and so on.

Here, too, the farm buildings, stock and implements were all different. There were no more of the fine bank barns, large fields of grain and clover and timothy and fine herds of cows and steers. Everything had put on a smaller, more minute aspect. Instead of barns for hay-storage were found ricks consisting of four tall, slender posts supporting a simple movable roof and filled with a solid square of hay. Instead of three horses to the plow, rolling under a heavy bed of clover or a stiff, well-pastured turf, a single horse with a small plow turned the light, reddish, sandy soil from which some crop of "truck" had just been taken.

North of New York a broad belt of fertile land along the river is devoted to mixed farming, but for any fifty miles there is a strange similarity in style and processes. Above Po'keepsie, for example, the main crop is hay for the New York market. The hay-barns are much alike, and contain room for storage, and almost always a horse-power, hay-press and baling apparatus, all under cover, so that the farmer and his sons or men, can bale hay in rainy weather, "while they are resting." The hay wagons are alike, too, having long, narrow platforms for the bales to rest on crosswise, and a windlass, or roller and ropes to bind them tightly down. And in late summer and autumn you will see dozens of these wagons, all alike, on their way down to the nearest barge-landing on the river. Though hay and rye straw are the main sources of income on very many farms in this section, yet the farming is quite diversified and "mixed" in character, and everything seems to turn to gold as if by magic under the touch of some of those shrewd old Dutch farmers. It does you good to visit one of them, and see all over his farm evidences of agricultural sagacity. Crops and fruit, and truck, all seem just ready to be turned into money.

My last visit to that region was in October, and I wished I had along with me some of those men who lugubriously ask, "Does farming pay?" Apples, potatoes, milk, honey, butter, veal calves, pork, peaches, grapes, plums, buckwheat, rye, etc., each bringing in considerable sums, and timothy hay and rye straw bringing up the rear with a cool thousand or fifteen hundred dollars to the single farm. On many farms apples are a considerable source of income. This belt along the Hudson seems the home of the Newtown Pippin. No where else does it grow so large and fair. One farmer I visited did not make apples a leading speciality at all; but he had just sold his Newtown Pippins alone on the trees, for $800, to a shipper to send to England. Another had sold his Newtowns alone for $500, and so on.

But I must not dwell, for I mention these things as mere illustrations. Different localities all through New England, the Middle States and the West—indeed, wherever I have had the good fortune to travel and observe the agriculture, seem to have their different modes of farming and their specialties more or less clearly defined. Usually, both the specialties and the modes are, *on the whole*, wisely adapted to soil, climate, markets and surroundings; but sometimes not. Often the farmers of one region may learn much to their advantage from those in distant localities. It will be the object of the articles that succeed the present one, to show what we farmers of one region may wisely learn and imitate, as shown in the farming of other localities. And I shall be glad of any suggestions that may help me in this important and somewhat difficult undertaking.

NOTES FROM THE RURAL'S EXPERIMENT GROUNDS.

The Rural New-Yorker's Free Seed and Plant Distribution.—Instructions.

Upon the whole, we have been fortunate in securing our seeds and plants as originally announced in the Seed Supplement to the Rural New-Yorker published in September last. Of all the kinds offered the Magnolia and Abies Sibirica seeds alone are likely to disappoint the average cultivator. From the time that magnolia seeds are gathered until planted, they should be preserved in moist sand. Otherwise they will require months to germinate, while it may be feared many will entirely fail. Our magnolia seeds were kept in sand up to the time that they were sent to the Rural office. It was then, however, necessary to place them in seed envelopes where they must, of course, remain until received by those for whom they are intended, a period, from first to last, of not less than six weeks. As regards the seeds of the Siberian Spruce, we may say that not until it was too late to change our original announcement did we learn from our respected friend Robert Douglas, the liberal-hearted nurseryman of Waukegan, Ills., that the tree does not thrive well much to the south of this latitude. In its place, however, we have supplied another kind of seed, not less valuable, the name of which we forbear to mention lest it should induce hundreds of additional orders which we could not fill.

As the pea crop in England was well-nigh an entire failure, it was impossible for us to import a large enough quantity of the Telephone to supply our applicants. We ordered 30 bushels which we calculated with our own supply would enable us to send a trial quantity to every applicant. From the replies received, we were led to suppose that there were not thirty bushels of the genuine Telephone pea in all England. We also applied to several of our seedsmen who advertise this pea, but found that they have it only in small quantities and were therefore unwilling to sell it to us at any price. While in this dilemma, the Southern Cow-pea was thought of. This we shall send to all Northern subscribers in place of the Telephone, while from our own stock of Telephone (badly weevil-eaten we are sorry to say) we shall be able to send our Southern subscribers (or those who have applied for the seed distribution) a few seeds of the Telephone. On the other hand, we are much pleased in being able to send the new Golden Mangel (see editorial page of last issue) which was not promised or announced in the original seed and plant selection at all, and we entertain high hopes that it will prove of greater value to our farmers in general than the Telephone Pea could have done.

Sowing the Seeds, etc., etc.

A few orders for the Cuthbert Raspberry were mailed last fall. The rest will be sent off as soon as the ground opens in the spring. Mr. J. T. Lovett, of Little Silver, New Jersey, has grown these plants for us and they will be sent directly from his nursery to our subscribers. The reputation of this grand Raspberry has spread like wild-fire since the Rural has placed it in its "Distribution," and the genuine stock is extremely limited. We request our readers to give it needful care, hoping in due time that their reports will corroborate our own testimony that, taken all in all, it is the best Red Raspberry known. Of course we do not expect it to succeed everywhere—there is no fruit known of which that can be said;—but we *do* expect that, like the Concord Grape, it will be found well adapted to an unusually wide range of territory. When received, spread out the roots carefully and cover them firmly with mellow earth and then cover the ground with a thin mulch of hay or straw. As regards the Telephone Pea and the Ennobled Oats, no instructions need be given. The seeds of

Abies Sibirica

germinate as well as those of any Silver Fir, only it is, as we have said, of very slow growth. Sow the seeds during April in a four-inch pot in sandy loam. Let the pot be well-drained by means of crocks placed over the hole at the bottom, and an inch or so of coarse sand above. Cover the seed with half-an-inch of soil. Then water and plunge it in a protected spot in the garden and cover with a pane of glass as a protection against mice or other vermin as well as to preserve the moisture. Germination of the seeds may be looked for the latter part of May. When germination is evident, remove the glass and shade a little from the hot sun.

Our New Golden Mangel.

As has already been stated, our stock of seeds of this Mangel was imported direct from Vilmorin & Co., of France, ordered just so soon as a doubt arose as to our being able to secure a sufficient quantity of the Telephone Pea. As the quantity which we send to each applicant is necessarily small, it is advisable that the seeds should be soaked so as the better to insure the growth of all. Superior keeping qualities, solidity, sweetness and productiveness are claimed beyond all others, for this variety. We shall offer a premium for the largest and smoothest Mangel produced from this seed, and in order to avoid unnecessary trouble or confusion, it will only be necessary for each competitor to send us by postal card the weight of his largest specimen. In our awarding the premium, it will then only be necessary that we request the raiser to send us such specimen by express at our expense, that we may verify his report. It will be well, also, to soak the magnolia seeds until the outside is softened. Then treat the same as seeds of Abies Sibirica, though planting rather deeper. Should they not germinate during the first season, cover the pots (plunged in the ground to a level with its surface) with evergreen boughs for a winter protection, hoping that they may germinate the following spring. Of all the

Hardy Flower Seeds

we have ever sent out, we consider none more choice or beautiful than the Hybrid Pentstemons and Iris Lævigata. We are confident that the first will surprise and please those who raise them, while the second seem to us as entitled to divide the admiration that is everywhere bestowed upon the best kinds of the improved Gladiolus. The seeds may be sown in the greenhouse or window and will soon germinate. Boxes three inches deep or flower-pots well-drained may be used. Fill to within half an inch of the top with light, rich earth, either leaf-mold from the woods, or garden soil mixed with very old manure and sand. The soil MUST BE light, otherwise it soon becomes so compact as to smother the tender germinating seeds. Sift the soil either through an ordinary coal sieve or one with finer meshes. Spat it down—sow the seeds evenly—cover according to their size, and again spat down until the soil is smooth and firm without being hard. The pots or boxes may then be immersed in water until the surface soil becomes moistened or else showered from a *very* fine rose upon the surface. The Bebb's Aquilegia seeds, being small, will need to be merely covered by sifting soil over them and pressing it down by a smooth block of wood or other substance of suitable size. Our readers should bear in mind that this seed is *mixed* with common sorts of no particular value (this was stated in our original announcement), but the majority of them will prove to be Bebb's Hybrids which, so far as we have seen, bear the largest flowers of any of the Aquilegias and are well worthy of general cultivation.

THE ELMIRA FARMERS' CLUB.

Sugar from Sorghum.

The Elmira Farmers' Club holds its meetings every Saturday evening except one week in each month, when a day meeting is held to accommodate people living at a distance who desire to visit the club. The subject appointed for the last meeting, held Saturday, Feb. 7th, was "The relation of agriculture to government," though the principal topic of conversation was "the manufacture of sugar from maize and sorghum."

Besides the members of the club and those who usually attend the club meetings, there were present many other farmers and prominent men from this and adjoining counties. Remarks were made by the Commissioner of Agriculture, Hon. Wm. G. Le Duc, Col. Piolette, W. A. Armstong and others. Several samples of sorghum sugar were exhibited, the results of experiments made with imperfect machinery and apparatus. Some of the farmers had experimented with sorghum, and had succeeded in making from it sirup and sugar of very good quality and at very little cost. Many others expressed a desire to make experiments in this direction, and many questions were asked as to the best mode of culture of the sorghum and the working of it up, etc.

In reply to these questions, the Commissioner said that the best variety of sorghum to grow in this latitude was the Minnesota Early Amber. He would plant in a rather poor soil, which should be well prepared, as the plant is exceedingly small and tender in the first stages of its growth, in hills 3½ feet apart each way. The seed should be covered lightly but well "firmed" down with the foot to prevent drying out while it was starting. About eight stalks should remain in a hill. Cultivate the same as for corn. As soon as the seed has matured the sorghum should be cut, first stripping off the leaves, which may be done conveniently by passing between the rows and striking them down with a lath or a four-tined fork, thus breaking them off. When cut, the seed ends of the stalks are removed when they are ready for the mill. The juice should not be allowed to stand long after being expressed, but should be removed to the evaporating pans and brought to a temperature of 180 degrees F., when it is treated with cream of lime at the rate of three pints to 100 gallons of juice. It should then be heated to the boiling point and the evaporation continued, skimming it occasionally until it is brought to a density of about 12 pounds to the gallon, when it may be drawn off into barrels where it will granulate of itself. He said the machinery and apparatus to accommodate eight or ten farmers need not cost more than $250.

The Commissioner further stated that from experiments made on the grounds attached to the Agricultural Department, Washington, good sugar in paying quantities had been made from corn-stalks after harvesting at the rate of 60 bushels of good shelled corn to the acre. Several farmers present had used the seed of the Early Amber Cane for feeding stock and had found it of much value.

Commissioner Le Duc is certainly deserving of much praise for the interest he is taking in the manufacture of sugar from sorghum and maize and for his endeavors to make it a successful and profitable industry. His earnestness in the matter has awakened interest in many of our farmers, and many experiments in this line will be made the coming summer.

Pomological.

KEROSENE.

GEN. WM. H. NOBLE, BRIDGEPORT, CONN.

No one should state a remedy which he does not know to be worthy of faith and test. We every little while come upon an old use of a new or some new use of an old thing, set down as sure to cure the aches and ills of man or beast, and to rout the insect pests. Just one of these is kerosene.

Though of an old family, it claims to have uses new and of wide range. It's a child from the fruitful stock of the coal fields and petroleum. Its tribe is full of all sorts of talent, real and possible. Whether you study it in gas tar or at the coal oil wells, you find it stored with no end of elements, useful and ornamental. It can turn you out a gentle perfume, a flavoring extract, or vials full of wrath and fire. It paints our homes, dyes our clothing, lights our houses, softens the whirr of the work-shop wheels and the mash of its iron jaws. It garners "the wealth of Ormus or of Ind," and about all their odors. It pens up fragrance as sweet as the the "spicy breezes that blow soft o'er Ceylon's Isle," and rejoices in stenches as foul as swarm in those smothering "stink pots" in which the "heathen Chinee is peculiar." From this pungent and manifold tribe comes kerosene.

About its talents in the orchard and garden a recent writer in the "Rural" puts forward some facts, hints and queries. Of such a thing you may say right off, that it can either kill or cure. Pretty much all that kills can cure. It's easy enough to kill; but the cure calls for measures and method. The more murderous the nature, the surer the cure when dealt out gently, well mixed with brains.

Such is kerosene. Like wind and fire and water, it is a very good servant but a very bad master. Its use has been urged for all sorts of ails and aches. For wounds and scalds, burns and frost bites, for rheumatism, neuralgia and cramps. Soon after the late war, some horticultural journal, flushed by a small trial, said it would kill every lichen and louse, and hurt neither bark nor leaf. Its advice to-day would not be quite as loud or loose. But I am a very sanguine man, of that breed Col. Ingersoll defines when he says, "Show them an egg, and directly they see the air full of feathers." I tried it on some young pear trees one spring; the leaves gave up their dead and so they did their lives. The bark stood it better, only one tree was scalded and that got well.

Since then I have only tried kerosene raw, twice. Each time to kill the woolly aphis or American blight. The first trial was on a large Early Harvest. Many of its joints and

limb crotches were colonized by the pest. They had squatted and foraged and blasted all around; the bark was thick and scabbed. I deluged and soaked with kerosone the crevices and whole outposts of the tribe. It killed the scourge and did not hurt the trees. I tried it a year last fall, on the same pest which swarmed in downy tufts over the pruning wounds, and bark bruises of two small apple trees of about an inch in diameter. These were closed in the fall, and so thoroughly that I feared the spring would reveal my rashness in a couple of ruined trees. But though the aphis departed from their borders, the trees were not sensibly hurt.

Now the writer whose note has called out this talk, says, "Kerosene, or petroleum, put in the fall about the roots of some trees, to keep off, I think, insect pests and 'varmints' killed the trees." It's very likely true. The root structure and bark are unlike and more tender than the bark of tree trunks and limbs. They differ in their duties. The root all through is made to drink in the food or harm to which it stretches. The upper bark is more like a robe, or shield and shelter. It stands frost, storm and drought and saves the vital parts beneath. But this kind of cover the roots have not, and do not need. What, therefore, on the bark might only make a cleansing wash, below is drank up by the rootlets and kills. What above would not reach beyond the scarf skin, below would strike the inner fibers of the wood and poison the vital currents of the sap.

Something like this result of coal oil, or coal tar, about the roots of an apple orchard, was some years since seen in this county. The field mice and, I think, rabbits, were destructive. A heavy coating of coal tar was put close down to the roots and some ways above. The "varmints" did not fancy the diet, nor did the trees. They were about all killed.

There is another thing which should be always held in mind by the orchardist. A tree will not stand tampering with its vital parts half as stardily in the fall or winter as in the spring or growing season. You may scrape with a hoe and gash and tear the bark in spring but the like in late fall or winter would prove fatal to the tree. At any rate, it would then resent such treatment as cruelty and hurt.

Now let some one else tell what he knows about the use of kerosene, about the cures of kerosene, raw or mixed with linseed oil, in any states of strength and admixture.

FIG CULTURE AT THE NORTH.

A CORRESPONDENT, some months since, sent me a slip cut from your journal, quoting it as an authority to the import that Figs must be grown under glass. Now the aphorism *audi alteram partem*—hear the other side—is always good advice. Figs are grown, and have been for many years, in Maryland, Pennsylvania, and Ohio with just as much success, and just as fine as can be grown at the South. And if they can be grown in these States, with the same care they can be grown anywhere in the North in the open air. Allow me to quote, not the authority of a person who never made the proper effort, but that of a fig grower for 50 years in Ohio, the pioneer fig culturist of the North, which demonstrates the entire practicability of fig culture in these climates.

G. F. NEEDHAM, ESQ.

Dear Sir: * * Fresh figs have for many years constituted an important part of my summer and autumn diet, and I am glad that the propagation and dissemination of this fine old fruit is in such good and zealous hands as yours, for I am too old to do much in what I consider the good cause of growing semi-tropical fruits cheaply in our climate, though I know *that it will be done*, sooner or later. So I cheerfully hand over the business to other and younger hands. Very respectfully,

Chillicothe, O., 1879. JAS. T. WORTHINGTON.

Our people cannot raise too much good fruit. I account fresh figs as one of the best of these. I would be pleased to send my pamphlet, (3d edition) to anyone inclosing a three-cent stamp; which sets forth the facts in the case, and gives full information how to grow, how to prepare for market, or how we use it.

G. F. NEEDHAM.

[We have no faith in open-air fig-culture in this climate. We would not do injustice to Mr. Needham—but the little pamphlet in question is not worth a three-cent stamp, and we do *not* advise our subscribers to send for it.—EDS.]

Kieffer's Hybrid Pear.

There appear to be various opinions as to the quality of Kieffer's pear, which is owing probably to the unripe state in which it has been gathered and eaten. I have had the pleasure of eating it for two or three seasons and found it of very good quality, especially those of the past season, and from what I have seen of it, I am inclined to think it will prove an acquisition for the market as well as for home use. New fruits generally improve with the age of the tree. It is too soon to give a decided opinion as to the full merits and value of this pear; it requires eight or ten years of trial and experience of new Pears and Apples before they can be fully recommended for general cultivation. CHAS. DOWNING.

Horticultural.

SCARLET TURBAN TOMATO.

NOT for its beauty, its quality or its productiveness do we present a picture of this tomato now offered in this country for the first time. We know nothing about it beyond the description given of it by its foreign introducers. It is

NEW SCARLET TURBAN TOMATO—FIG. 61.

said to be of German origin, particularly early and prolific, producing a dozen or more tomatoes in a cluster. Each fruit contains but very few seeds and these lie near the skin, so that the rest of the tomato is, so to say, seedless. We shall try this among our novelties to be tested next summer and give our readers the result. Meanwhile the accompanying cut may serve to familiarize them with its appearance.

EARLY PEAS.

AT page 92 of the Rural, you give an excellent list of Peas for early cultivation, but characterize the Philadelphia as the poorest of all there mentioned. I presume you are aware that a difference of soils and sometimes of fertilizers often makes a difference in the flavor of all kinds of vegetables. I have cultivated a dozen or more different sorts of peas in my garden for the past ten years, and find the Philadelphia Extra Early equal in flavor to any, and a few days the earliest. My summer residence is in New Jersey, near the sea-shore; the soil a light yellowish mixture of sand and gravel of quite moderate fertility. Tom Thumb in this produces so little it is not worth cultivating; though Mr. Roe says, in his work on gardening, that if the land is made rich it produces fairly. The first year I did not get my seed back. The second I made the soil about as rich as a manure heap, and yet it yielded little more; I then gave it up. Dan O'Rourke, Alpha, McLean's Little Gem, and some others you mention, I have tried and find them good; but, after all, the Philadelphia is the greatest bearer, and the most reliable of the early sorts in *my soil and climate*, and is excelled by none in flavor when *properly cooked*. Champion of England is the most reliable and best in flavor of all I have yet cultivated of the later sorts. But I intend to try a dozen or more kinds over again the coming season, and see what they prove, and will report the same to you. W. B. A.

The Apiarian.

A FEW MIXED THOUGHTS TO BEE-KEEPERS.

J. G. BINGHAM.

BEE-KEEPING, though pursued by some as a special business and by others as a pleasant pastime, is essentially one of the economies of the farm, and in the Old World a farm would hardly be thought completely stocked without a few hives. In this country bee-keeping by ordinary farmers is the exception rather than the rule. Indeed, it is looked upon by not a few as a sort of weakness, a species of hobby-riding, when a farmer takes to keeping bees.

Now, I believe in what is called "mixed husbandry." The tendency is too much to go into one particular line of things. A few years ago the mania was for wheat-growing, because wheat was the great cash article in the produce market.

The rage of the West has been too much for corn. When Merino sheep were bringing fancy prices, everybody was crazy to go into the raising of them. Not many years since the rural passion of Central New York was for hops. Just now, perhaps, the inclination sets toward pet stock raising and dairying. The latter is commendable. But I contend that the wiser plan is to pursue a miscellaneous, general system of farming, except in those cases in which some peculiarity of soil or location dictates a specialty. Farmers should avoid as much as possible putting all into a single venture. They should try all honorable expedients to increase their gains, and if one source of profit fails, another will succeed. Nor should they despise little gains for many a "little" helps to build a fortune.

Bee-keeping well deserves a place among the industries of the farm. As it is wise to keep poultry to pick up the waste grain and stray seeds, so it is wise to keep bees to gather the nectar of clover, orchard blossoms and wild flowers, that would otherwise go to waste. It costs but little more to make a start in bee-keeping than it does to make a start in poultry-keeping, and, season for season, I will match the bees against the chickens, with large odds in favor of the bees. Bee-keeping used to be a very crude affair. It was carried on with gums or straw hives, inside of which everything was fast-fixed and all a realm of mystery. The bees were left pretty much to themselves until the close of the honey season, when they were wickedly smothered with brimstone fumes; and the colony being thus exterminated, its stores were appropriated to the use and luxury of the owner.

Now we have the movable frame hive, which gives us access to the interior of the colony, perfect control over it, and liberty to take the surplus honey without killing the bees. With this form of hive, the loss of swarms by their going off to the woods can be prevented, queens can be given to the stocks that become destitute or them, and weak colonies can be strengthened by giving them comb, bees, or honey. Another modern improvement in apiculture is the importation and breeding of superior bees. Bees, like larger stock, deteriorate by in-and-in breeding and may be improved by crosses. There are inferior and superior breeds of bees, just as there are of poultry swine, sheep, cattle and horses.

For ten years past Italian bees have been largely imported, and though it may seem an extravagant thing to give five dollars for a queen bee—a little insect only about an inch long—it is no more so than to give a hundred dollars for a superior male calf or lamb. The Italian cross has greatly improved our common black bees, by giving them a "dash of fresh blood," as stock-breeders would express it, and by imparting to them desirable qualities. The Italians are a hardier race; busier than "the little busy bee" we have known from our childhood; more prolific; more beautiful in appearance, and less inclined to sting. Honey and beeswax are marketable articles for which there is a well-nigh limitless demand, a demand which, like that for fruit, increases with the supply. Honey forage is abundant everywhere. The Willow yields, early in spring, pollen, propolis, and and some say honey. Our early wild flowers and fruit-blossoms give the bees something to do; and when white clover spangles the fields and roadsides, the honey harvest is in all its glory. The basswood or linden blossoms and the late Raspberries, Asters, Golden-rods, and buckwheat protract the honey season into the fall. The bees are the best farm laborers we can have, inasmuch as they work for nothing, and provide for themselves.

The chief trouble with beginners in bee-keeping is that they will not go to the slight expense and small trouble *necessary* to get informed on the subject. They buy a hive of bees, about which they know nothing, except that bees can sting, and that honey is nice, and then leave it to take care of itself. It is needless to say that this is a very foolish course to adopt. What wonder that only failure and loss are the results? It would be the same in sheep-raising, dairying, or any other line of farming. While, therefore, I advise the farmer to make bee-keeping one of many lines of industrial pursuits, I qualify the advice by urging that it be by no means entered into without seeking information in regard to it. This can easily be obtained from books on apiculture, and from bee journals.

McGrawville, N. Y.

QUEEN BEES BY MAIL.

As has already been announced in our agricultural news columns, queen bees can be sent by mail. This important decision was brought about mainly by the efforts of Prof. Cook (author of the Manual of the Apiary), who went to Washington to interview the Postmaster-General in person. Until a few years ago there was no rule against sending bees by mail; but people grew careless in doing up the packages, other mail matters were daubed with honey, and not unfrequently post office clerks were stung by escaping bees. This state of affairs could, of course, not be tolerated for any length of time, and suddenly the edict went forth that bees should be unlawful mail matter. Bee-keepers soon found that it was a great inconvenience and even a detriment to the development of the industry to have queen bees debarred from the mails. Especially was this inconvenience felt in out-of-the-way places where there were no express offices, and where, consequently, improved bees could not readily be imported. Repeated efforts were made to revoke this ruling, but they were made in vain; the Postmaster-General was immovable. At the meeting of the International Bee-keepers' Association in Chicago, Prof. Cook was appointed a committee to renew the request, and his efforts were rewarded by the above favorable result.

A proviso is, however, attached to the suspension of the ruling. Queen bees and their necessary attendants will be mailable matter only so long as no person is injured by them in handling the mails. It is, therefore, of prime importance that bee-keepers who make use of this privilege, should exercise the greatest care in packing. The carelessness of one person may cause irreparable damage to the whole industry. A cage having a double bottom of pieces of wire gauze or perforated tin, placed one-quarter of an inch apart, has been suggested as suitable for the transportation. The food given to her majesty and suit during her passage in such a cage, should always be candy. Honey is too liable to flow out and damage other mail matters.

The Herdsman.

UGLY BULLS, THE CAUSE AND REMEDY.

COL. F. D. CURTIS.

IT is getting to be a frequent occurrence for some one to be injured by a bull. One of my neighbors was knocked over not long since, and would have been killed but for the attacks of several young bulls upon the old one who was trying to gore his owner. The bulls were all running loose in the yard and the old one was fed meal in a tub. While the neighbor was trying to turn the tub over so as to put meal into it, the bull, impatient for the meal, began to gore him. This bull had hooked a hired man before and was inclined to assert his rights to the mastery of the barn-yard. Such an animal should never be allowed to run loose. It is always dangerous. He should have been confined in a stall and both his food and water taken to him. If necessary to keep him quiet, a slipping noose with a stout rope should have been put around his neck. Tying by the ring in a bull's nose is not safe if the bull is inclined to be ugly. The slipping noose will never be tightened but once, as one lesson will teach the bull that he is in subjection to that rope. This is the first lesson to teach any bull—that he must yield to his master. This lesson should be taught when the bull is a calf,

by making him to lead, to back up, and stand around at the word. When this is done and followed up there will scarcely ever be any danger from bulls, provided certain other equally sensible rules shall be followed.

The young bull should never be fondled or handled about the head, as it gets him in the habit of tossing the head, which is a dangerous practice when he gets older and his horns are grown out. Familiarity breeds contempt—with a bull wondrously soon. He does not appreciate petting, but must always be made to step aside for his master, and this habit must be taught him when a calf. When he grows up to feel his strength, if the attempt is made he will naturally rebel and assert mastership. When bulls do this and stand and paw the ground and roar, with their heads down, they are dangerous. Any person is foolhardy who will approach them in front or without a stout club in hand. Such animals should be confined and led with a staff. High feeding always tends to make a bull sportive, if not ugly. A sportive bull is dangerous, as it is so natural for him when inclined to play to throw his head around and strike with his horns.

An ugly bull, if required for service, should be fed light—only enough to keep him thrifty, and when designed for fattening he should be tied fast with a slipping noose. Every bull should be separated from the cow the *instant* copulation has taken place, and it is always dangerous to drive them away at any other time when a cow is in heat. A bull should be treated kindly by his master or he will learn to hate him, and in an unguarded moment the beast will take his revenge. A bull will remember a wrong and is at all times treacherous. He should be so handled that he is not made nervous or excited at the approach of the master. Obedience and kindness should go together, and obedience must be taught when they are young. It is always best that one person should do everything for the bull. He will act better and acquire a sort of respect for the one who tends him. A bull is always excited by the presence of strangers, as he is by the sight of strange bulls, which he will fight to the death, whereas he is generally fond of a companion bull. Bulls have traits which must be understood or there will be trouble with them.

We have pointed out the most important, and will only add that among a large number of bulls, Ayrshires and Jerseys and natives, we have never had an ugly one which was broken or trained when young. The rules which we have mentioned are also carefully enforced. The winter is a good time, if it has not been done, to train the calves and get them used to the halter. After being tied up a few days, with a halter placed on the head, not on the neck, they will soon learn to lead, after which they should be drilled in backing up and standing around. This last lesson gives them the idea of getting out of the way, and lessens the danger of their pitching at persons afterwards and goring them. The halter should be put behind the ears, so it will not touch the eyes.

Miscellaneous.

NOTES FROM MEADOW GLEN FARM.

Wheat Account for 1879.

Dr.	
Plowing two days	$6.00
Harrowing	3.00
Handling manure	2.00
Guano	5.72
Drilling	1.50
Harvesting	6.00
Thrashing	3.50
Seed	8.00
Interest on land @$100 per acre	12.00
	$49.72
Cr.	
Fifty one bushels wheat	$76.50
Straw (estimated)	3.50
	$80.00
Expense account	49.72
Net profits	30.28

This from two acres of land, the soil a clay loam mixed with slate. Yard manure was applied at the rate of ten loads per acre and harrowed in. I have not charged this in account, thinking the land was left enough better to pay for it. The wheat was plump and nice, of the Diehl variety, and makes nice flour.

Cows and Calves.

We have a favorite Ayrshire heifer with her young calf, both doing finely. We keep them in a box stall, using care not to expose them to wind, or give them cold water. A neighbor lost a fine cow by imprudently giving it a pail of cold water soon after calving. Our calf is as fine a one as we could wish—a cross between Jersey and Ayrshire. We think this the best cross for practical purposes, the Ayrshire supplying quantity and the Jersey quality of milk.

Calves in Winter.

A fine Jersey bull-calf was not doing as well as his companions, so we thought best to put him alone and increase his feed by giving a pint more than his usual mess of meal, at first not increasing it too fast for fear of scours. But finding no harm done, we increased up to three quarts per day, which is enough for a calf. The meal was corn and oats ground together. By the way, our grandfather always said that bull calves never wintered as well as heifers, but this was our youngest calf.

Mating Fowls for Exhibition.

In the spring of 1878 we obtained a trio of Silver Gray Dorkings of a well-known farmer in this county. In the fall of the same year we exhibited them at the county fair, and, as we expected, he also had several trios there; but the judges awarded ours the first prize. Had his been properly mated, it might have been otherwise. The fault was, his cock had a double comb and the hens single ones. Now the standard allows both, but requires them to be mated in a show-pen. This shows that an exhibitor of poulty must be thoroughly posted on the points required by the standard.

Market Lambs.

It is generally supposed that it requires a lamb four months to arrive at that condition that butchers call ripeness. Our single lambs were fat at the age of two and a half and three months, and our twins when four months old. Last spring a lamb born April 15, weighed 59 pounds in the month of June. Its dam was a two-years-old, its sire a South Down lamb. Another born April 14, and sold to butchers the second of July, weighed 70 pounds. Another ewe three-years-old raised twin buck lambs, which, when three and a half months old, weighed 86 pounds each. Our lambs received no extra care, were all sold when less than five months old, and the butchers said their customers complained that they were too fat.

Winter Management of Sheep.

To have success in sheep keeping a man must first have some fancy for the business. Supposing them to have had good care through the summer and fall, the change from green to dry feed should be as gradual as possible. They should be yarded at night as soon as frost comes, and have hay in their racks; the lambs and older ones should be fed a little grain. It is necessary to look after their wants and supply them before the sheep suffer or run down. One should anticipate or foresee what they will need, before actual necessity opens his eyes to the matter. The flock should be divided so the weak and strong are not together; then they can be fed as each class requires. We think early cut and well cured clover hay the best single feed. We change, however, from hay to straw and stalks, but do not confine them long to the latter. We give corn and oats for grain. We prefer to have them in close stables instead of open sheds, that they may be kept confined, but the stables should be well ventilated and the sheep should be allowed to run in yards daily in pleasant weather for exercise. We also feed them in the yard in dry weather. Some object to keeping them in yards, but we never have deformed lambs, and raise 150 per cent of lambs from the number of sheep kept, by always confining them in yards in winter. Salt is very necessary for sheep; they should have free access to it, and it should be kept so as not to get mixed with snow. We mix a little sulphur, which tends to keep the ticks away. We also add a little oil-meal, which is a preventive of stretches; lastly, there is no room for argument, but sheep require water in winter; snow is a *poor* substitute.

Saratoga Co., N. Y. ABEL HOYT & SON.

WHAT OTHERS SAY.

NEWSPAPER SUBSCRIPTION PRICES—A GENERAL ADVANCE IMPENDING.—It is rather late to talk of advancing the subscription price of papers when two-thirds of the subscriptions are already received for 1880, speaking at least for agricultural papers. We take the following from the Journal of Commerce: "If the market value of raw materials continues to advance, every American newspaper which has reduced its subscription price will sooner or later be obliged to raise it. The alternative will be a loss to the publisher on every copy printed. The newspapers were the pioneers in the cheap era now closed. They led the way in reductions and made far greater sacrifices than any of the classes of business that followed them. In other lines of manufacture and trade the lowering of price—where any occurred—was gradual and went no further than the necessity of the situation seemed to require from day to day. But the newspapers struck from 20 to 25 per cent. off their subscription rates at a blow. The concession was too early and too liberal. It was based on expectations that have not been realized. Though newspapers were the first things cheapened, they are the last to go up to their point of true value. The cost, of printing paper and of everything that enters into the production of a journal has largely advanced. The reaction in prices extends to every other article of use and luxury. The inevitable expense of doing business and of living have greatly increased. The only thing that can now be bought at last year's price is the newspaper. It is impossible that this should long remain the sole exception to the rule of universal appreciation. The Chicago papers are the first to do what cannot be longer avoided. The Times of that city has boldly marked itself up to $16 a year including its Sunday edition, and six cents a single copy. This advance is fully warranted by the increased cost of the paper it uses—stated at 50 per cent.—and the other increased expenses of its production. The St. Louis papers are following suit. No journal can be expected to run itself at a loss on every sheet issued, and no subscriber who is partaking of the general improvement of prices in his own business will grudge the same chance of living to the newspaper press. It is the newspaper's turn—that is all.

POLLED CATTLE.—Of the polled (hornless) breeds of cattle of Great Britain, the Black Scotch for beef alone takes precedence, while the Red Norfolk and Suffolk of England are preferred for a combination of beef and milk. Mr. A. B. Allen, in the N. Y. Tribune, says that the cows of this latter breed generally excel in the dairy, and when dried off fatten kindly and make excellent beef. During the past thirty years moderate importations of Black Scotch have been made into Canada, Northern New York and Michigan, and some half a dozen or so of the Red Norfolk, about five years since, into Putnam County, N. Y. All these have done well and are much liked. Some Scotch Black Polled bulls were taken on to the Western plains six years ago, and bred to the wild long-horned Texan cows. A large majority of the calves dropped from this cross were black and grew up polled, or with mere stubs of horns, and were a great improvement over their dams. Some of these steers begin to appear in our markets and are much liked, especially for shipping across the Atlantic, they can be transported so much more safely and cheaply. Their hides suffer no injury by being gored by their fellows; they arrive at their port of destination in superior condition, and are consequently of quicker sale and at higher prices.

"THERE is every reason to believe," says the Valley Farmer, "that next year's wheat crop will be the largest ever raised since the creation of the world." This is a startling way of putting it, but the probabilities so indicate.

CATALOGUES, ETC., RECEIVED.

NOTE.—Readers are referred to our advertising columns for any particulars omitted in the following necessarily brief notices:

R. H. ALLEN & Co., 189 & 191 Water St., New York. A handsome catalogue, and one of New York's old, responsible firms. We here find offered several varieties of seed about which we have received many inquiries of late. We are glad to find our own report of Doura so well corroborated, as shown in the following extract from this catalogue: "Judging from our experience with this plant the past two seasons, and from reports of the experience of others, we believe this to be the most valuable of all the fodder plants recently brought to our notice. It is similar to Broom Corn in its growth, having, however, a very compact, upright head. . . . It grows eight to twelve feet high, is very leafy, suckers freely, and, as it may be cut several times during the growing season, is one of the best forage crops both for green and dry fodder. When cut for drying, the crop may be treated precisely like corn sowed for fodder. Owing to partial failure of our crop, we can only offer the seed by the packet." . . Let us here repeat that our plants, of which we spoke so highly, were raised from seeds sent to us by this firm. We desire to make this plain to our readers for the reason that some kinds of Sorghum, called Doura, develop but *one* stalk to the seed and are of no special value as fodder plants. It may be that a second season's trial of this would not confirm our high opinion as derived from last season's test. Thus judged, however, and the farmers of our neighborhood will confirm the statement, we have never before seen so large an amount of leaves and stalks produced from a given area. The *second* growth of this Doura was taller when our first frost occurred, than the Pearl Millet growing in an adjacent plot which had not been cut at all. We respectfully ask that those of our friends who plant this seed, will report their success or failure to this journal. We are very earnest in desiring to make its supposed value for this climate known, and would gladly purchase 100 bushels of the seed for free distribution, if, through our correspondents, we should be able to procure so large a quantity. Our Doura would have ripened a small quantity of seed but for the sparrows. But we incline to the belief that our seasons are generally too short for seed to mature in this particular variety. The drooping Sorghums mature seed fully. To return to the Catalogue, which is sent free to applicants we find among other notable seeds, Webb's Kinver Yellow Globe Mangel, Cow Peas, the Telegraph Pea, etc.

ELLWANGER & BARRY, Rochester, N. Y. Descriptive Catalogue (No. 1) of Fruits. A colored plate of the Waterloo Peach; woodcuts of a branch of the Stump Apple, showing the remarkably productive quality of the tree and of the Souvenir du Congres Pear, are among the more notable illustrations of this valuable work. Everyone of our readers interested in fruit should send for it. The Hints on Transplanting are full, practical and trustworthy.—Also descriptive priced-list of Strawberries.

E. A. REEVES, 68 Cortlandt St., N. Y. Illustrated Descriptive Catalogue of vegetable, field, fruit, herb, shrub seeds, etc., etc. Sent free to applicants. We see among particularized seeds the new Kinver Yellow Globe Mangel, Hungarian Millet, Spring wheats, Spring rye, etc.

CROSSMAN BRO'S, 300 Monroe Ave., Rochester, N. Y. Wholesale Price-list of garden, agricultural, grass and herb seeds. They call special attention to their onion seeds and to a new lettuce, the Eureka, which they now offer for the first, entirely different from other sorts.

THE COTTON WORM, Bulletin No. 3, of the U. S. Entomological Commiss.; by Prof. C. V. Riley, containing a summary of the natural history of the cotton worm, with an account of its enemies and the best means of controling it.

W. H. REID, Rochester, N. Y. "Key to Success in the Garden," and Annual Catalogue. A very neat and finely illustrated little work that every lover of the flower or vegetable garden will prize.

L. W. GODELL, Amherst, Mass. Illustrated Catalogue of seeds, bulbs and plants. Mr. Godell makes a specialty of flower and other seeds in collections, at very low prices. Catalogue free.

VANDERBILT BRO'S, 23 Fulton St., New York. Catalogue of Farm and Garden Implements—garden, field, flower, fruit and tree seeds, etc. Illustrated; especially the Implement department. Free.

ELLIS BRO'S, Keene, N. H. Illustrated and Descriptive Catalogue of greenhouse and bedding plants. Also send several circulars—all worthy of examination. Free.

BARR & SUGDEN, 12 King St., Covent Garden, London, W. C., England. Descriptive catalogue for the flower and kitchen garden—Gladioli, Lilies, Iris, etc.

LAWSON SEED & NURSERY CO., Edinburgh, Scotland, and London, England. Everything for the garden, farm and nursery.

B. S. WILLIAMS, Upper Holloway, London, N. England. Flower, Vegetable, Agricultural Seeds.

Scientific and Useful.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN 36.—FEB. 7, 1880. (ABBREVIATED.)

Shell Marl.

324. Received from Mr. Nathan Hart, West Cornwall, Oct. 22d.

Moisture	23.72
Silica, sand and insoluble matter,	16.88
Oxide of iron and alumina,	1.55
Lime,	27.99
Magnesia,	.97
Soda,	.59
Potash,	trace
Sulphuric acid,	.46
Phosphoric acid,	trace.
Carbonic acid,	21.77
Organic matter* by difference,	5.87
	100.00
*Containing organic nitrogen,	0.44

THERE can be no doubt that its employment, in liberal quantities, viz: one or more tons per acre, especially upon grass lands, would often be attended with decided and long-continued benefit, but, in most cases, its action upon grain crops would not appear at once in so decided a manner as is very commonly the case with good superphosphates or guanos.

The fertilizing effects of this shell marl as well as its commercial value may be safely measured by the percentage of lime which it contains. Its effects on crops would be in general quite similar to those of oyster shell lime although somewhat less pronounced since carbonate is a less energetic agent than hydrate of lime. Its content of lime, 28 per cent., is less than one-half as much as that of the three samples of slaked unscreened oyster-shell lime described in the analyses on next page, whose average is 59 per cent. As 1,000 pounds of the latter cost at New Haven, shipped in casks, $3.20, it is evident that the proposed price of the marl, $15 per ton, is much too large, even after making the most liberal allowance for cost of handling.

Oyster Shell Lime.

The three accompanying analyses exhibit the composition of samples of oyster shell lime and screenings made by H. A. Barnes &

Co , Fair Haven. The samples were taken on Nov. 24th, 1829, by Dr. Armsby, with the assistance of Mr. Barnes, who has also supplied the following data descriptive of the samples.

328. is unscreened oyster shell lime, slaked the day the sample was drawn.

329. is unscreened oyster shell lime, slaked, and about six weeks old.

330 is oyster shell lime screenings.

The two samples of slaked lime are fine and in good condition to apply to land, 328 being quite dry in handling, 329 damp and coherent.

The slaked and unscreened lime which these two samples represent is sold by measure and not by weight. The price, in November, 1879, was 8cts. per bushel at the works, and 9¼ cts. per car load, shipped in bulk at R. R. Depot. The average weight of the screened slaked lime used for building purposes is stated to be 47 pounds per bushel. As the screenings amount to 3 to 5 per cent. of the total, it is not far from the truth to assume that the unscreened will weigh 50 pounds per bushel. The cost of the lime would be 16 cents per 100 pounds at the kilns, or $3.20 per ton. Shipped in casks holding 16 to 25 bushels, the lime would cost about 1½ cents more per bushel and the casks cost $1 each, which would bring the cost of a ton up to about $6.40, two casks included.

The screenings, 330, consist largely of imperfectly burned shells, entire or in fragments. They are not shipped but are sold at the kilns for 4 to 6 cents per bushel.

ANALYSES OF OYSTER SHELL LIME AND SCREENINGS

	328	329	330
Lime	64.47	53.60	53.82
Magnesia	.41	.32	.24
Oxide iron and Alu'na	1.50	1.43	1.14
Soda	.16	.27	.15
Potash	.04	.06	.03
Carbonic Acid	7.79	8.89	22.34
Sulphuric acid	.52	.69	.23
Chlorine	.04	.09	.01
Phosphoric acid	.17	.19	.15
Silica	2.24	2.41	
Sand	5.08	2.85	6.12
Coal	.65	.94	2.60
Water (by difference)	16.93	28.33	13.17
	100.00	100.00	100.00

In the subjoined statement are given the proportions of the various chemical compounds that probably exist in the samples.

	328	329	330
Carbonate of lime	17.45	19.73	50.52
Hydrate of lime	68.64	52.34	33.29
Sulphate of lime	1.13	1.48	.49
Phosphate of lime	.37	.41	.33
Silicate of lime	4.33	4.66	
Magnesia	.41	.32	.24
Carbonate of potash	.06	.09	.04
Carbonate of soda	.23	.43	.24
Sodium chloride (com. salt)	.07	.03	.02
Oxide of iron and alu'ina	1.50	1.43	1.14
Silica			6.12
Sand	5.08	2.85	
Coal	.65	.94	2.60
Water	.00	15.29	4.97
	100.00	100.00	100.00

A brief review of the chemistry of lime manufacture may be serviceable. Clean oyster shells consist chiefly of carbonate of lime. As they are used in lime manufacture they contain probably about seven per cent. of moisture and organic matter, about six of soil and sand, and 87 per cent. of carbonate of lime. In passing through the kiln the carbonic acid is mostly expelled. If completely expelled the loss would be 38 pounds of carbonic acid for 100 pounds of shells, leaving 49 pounds of quick lime (calcium oxide). With this would of course remain the sand, mud, etc., that originally adhered to the shells, together with the ashes of the coal used in burning.

The lime thus obtained is slaked by throwing on water, in order to reduce it to a powder. In this process of slaking, water and lime enter into chemical combination, the 49 parts of lime becoming 64 parts of hydrate of lime. In practice some carbonate of lime remains undecomposed by the burning, and in the slaking process, the use of insufficient water may leave some quick lime unconverted into hydrate, or excess of water may remain as moisture, as is the case with sample 329.

When applied to land, oyster-shell lime may act as a *fertilizer* strictly speaking, or an *amendment*. Commonly, both kinds of action are exerted, and the distinction between fertilizer and amendment is not generally recognized in practice, although very important in considering the effects of this substance. Lime is used as an amendment on heavy clay soils, two to three or more tons being sometimes applied per acre. On loams or light lands 1,000 pounds or 20 bushels of oyster shell lime, applied once in two or three years, is a usual application, equivalent to the addition of 300 to 500 pounds to the acre, annually. It is evident that the small quantities of potash, magnesia and phosphoric acid contained in such doses of oyster shell lime can have no sensible effect upon crops. It is the lime, alone, therefore, to which any benefit must be ascribed. A consideration of the modes of action of hydrate of lime, when applied as a fertilizer, will make evident that it is one of the most valuable aids to the farmer and deserves more attention from Connecticut land owners than it has received.

Our cultivated crops contain on the average as much lime as potash. The necessity for the application of potash salts is fully recognized, but probably the lack of lime is as common a cause for unfruitfulness; for while potash seldom wastes from the soil to any serious extent, and is found in spring, well, and river waters in extremely small quantities, lime freely dissolves in water and rapidly wastes from the soil, so that other things being equal, there is more need for its restoration.

Dairy Husbandry.

NEW YORK STATE DAIRYMEN.

[Rural Special Report.]

THIS Association held its annual meeting at Utica this year, and while the attendance was not large, the interest shown was enthusiastic and the addresses most admirable. Taken as a whole I believe they were the best and most practical it has ever been my pleasure to listen to. The opening address was given by Mr. M. Folsom, of this city, the president of the Association. He reviewed the past and present state of the market and called attention to the want of reciprocity on our protective laws and drew a glowing picture of what might occur to this country should England pass laws protecting her dairymen to the extent that many interested, are protected in this country against the manufacturers of England. He approved of making the Commissioner of Agriculture a member of the Cabinet, so that he could look after those interested, that the farmer was too busy to attend to himself, among which he named the grasshopper plague, cattle plague, army worm, the Colorado beetle and other bugs. He strongly condemned the return butter pail and advocated a simple uniform, package that should go with the butter when sold. New York butter is a little under the average this year while cheese is better than ever.

After a lively debate on the gang press unpleasantness which Messrs. Whitman & Burrell have happily settled by buying up all the conflicting patents, a box of different varieties of foreign cheese, a present from the Messrs. Thurber was opened and greatly relished by the dairymen present. This has been a charming feature of a number of dairymen's conventions this winter for which the Messrs. Thurber are entitled to the thanks of all present.

In the evening the first speaker was Mr. L. S. Hardin, whose address concerning the National Dairy Cattle Club was the same reported in this paper from the Vermont Dairymen's Association.

Mr. Hardin was followed by Mr. B. D. Gilbert, the Secretary of the Association. His subject was importation of foreign cheese into the United States. The fine foreign display of the Messrs. Thurber at the first International Dairy Fair first opened the eyes of the dairymen of this country to the excellence and variety of this class of cheese. The trade which represented 3,120,112 pounds in 1875, has, however, gradually diminished until it has reached the sum of 2,618,793 in 1879.

By comparison with the cheese production of this country, it will be seen that as one increased the other decreased. That is, the more we made of cream the less we needed of a foreign make. Our foreign supplies came from England, France, Germany, Italy, Holland and Switzerland. Limburg, he says, is no longer imported. "It has grown with our growth, though it will hardly need to strengthen with our strength." Our dairymen can make nearly all the imported kinds, but they must bear in mind that many require a full year to ripen for market, so that ready money could not be looked for in this quarter. It would also require new fittings for the factories. He advocated a widening of the dairymen's business by creating a larger demand for varieties of dairy products. "There is," he says, "no foreign cheese brought here to-day the price of which would not enrich any man in a short time, providing that he could manufacture it at home."

Mr. Gilbert was followed by X. A. Willard on the commercial history of the dairy. This address was mostly taken up with statistics. He divided the subject into decades of ten years each, and told how prices had gone up and down, while the production had gradually increased. Prices have maintained a pretty even balance from 7½ cents a pound for cheese and 15 cents for butter in 1825, when the make could not have exceeded a few thousand pounds, to the average of the last decade of about 10 cents a pound for cheese, when the export trade alone demanded over 158,000,000 pounds. He questions if present prices for cheese can be maintained in view of the low prices of beef and pork sold in England. He calls for a better quality of make and warns the dairymen against adopting new methods blindly. Mr. D. W. Lewis, of this city, delivered a very funny address on the effect of greenbacks on the butter and cheese trade.

Reports of committees were received approving the efforts made to have the Department of Agriculture made an executive department; that Congress take measures to stamp out pleuro-pneumonia; that the tolls on salt shall be abolished; that the thanks of the Society be tendered to the Messrs. Thurber for the present of foreign and domestic cheese; that freight discriminations against farmers be legislated against; that the interests of the dairymen of New York would be enhanced by visiting the various dairymen's associations, and that all lawful means shall be taken to put down the unlawful traffic in oleomargarine.

After this the election was held, and, in accordance with the suggestion of Mr. Folsom, the retiring President, that none but dairymen should hold office in dairymen's associations, Mr. Robert McAdam was elected President for the ensuing year, and Mr. Gilbert retained as Secretary.

Prof. I. P. Roberts, of Cornell, gave an exceedingly interesting address on cattle, their food and management. All his illustrations were taken from actual experience at the college farm. In regard to cutting hay, he said it had been chemically determined that neither early nor late cut hay was most nutritious, but that cut intermediately between the two; that the best air for the stable was neither extreme heat nor extreme cold, but medium and especially very dry. Cows should have exercise. In Holland, where cows are kept up the whole winter, he had noticed large lumps on their legs and that they walked as if suffering from rheumatism. He could find no profit in steaming food. He gave the exact figures of what his cows had done in milk and the money received for it, and said the movement now undertaken to induce farmers to keep the records of their cows' performances was the greatest effort ever made to improve the condition of the dairymen of the world. H.

The Poultry Yard.

FANCY PIGEONS.

CARL VERA.

FANCY pigeons! what are they good for? This is a question that is often asked, and it is sometimes put in a criticising and scoffing manner by prominent horse fanciers and even poultry fanciers. With the same propriety might be asked: What good are any kind of birds? What good are flowers? Why were they given to us? For there is just as much in the scores of varieties of pigeons to claim attention and interest as in the birds or flowers. The dove, or pigeon, is associated with all that is holy in Christianity, and with much that was held sacred in mythology. Its very name in Hebrew, "Jona," is derived from a word signifying gentleness, and from the day it brought the olive-leaf to the Ark, both the plant and its winged bearer have been esteemed emblematic of peace. That the pigeon fancy is of very old date will be seen by an examination of the works of classic writers, and many extracts might be taken, were they needed, from such writers as Shakspeare, Tennyson, Pope, Moore, Hood and others.

One extract from Thomas Hood—he who sang the "Song of the Shirt"—I cannot forbear giving, it so aptly expresses our idea of a deserted home:

"No dog was at the threshold, great or small,
No pigeon on the roof—no household creature—
No cat demurely dozing on the wall—
Not one domestic feature."

We all have our fancies; these fancies express themselves in various ways. A man must have leisure to enjoy a fancy, or money to pay for it, and either presupposes a state of society where one does not have to work himself to death to obtain a living, or one where, mayhap, fortunes are accumulated and hereditarily descend to the one who possesses the fancy. The pigeon fancy is ornamental, instructive and fascinating. Why it is fascinating is very simply and easily stated. It is the cultivation and pursuit of *ideal beauty* in its highest forms; it is the constant effort to approach a standard of perfection impossible of attainment; it is progress ever approaching completion, yet never completed, towards a beautiful shadow which ever and anon seems within reach, yet which is never grasped. It thus presents all the encouragement of success, with all the stimulus of failure; all the satisfaction of good work well done, with all the desire for greater perfection yet to be accomplished. Such statements and comparisons as these may, perhaps, provoke ridicule, but, if so, most unjustly, for in their truth lies the engrossing interest of pigeon-breeding to those who follow it, and the reason why, if a man becomes fond of pigeons at all, he becomes so *very* fond of them. For this reason some of the busiest and best of men become pigeon fanciers under the ever-increasing pressure of the battle of life in which they are engaged. They need—they crave—something which shall afford them relief from their cares, reaction for their wearied minds, for the mind—far more than the body—needs it in these days; interest and enjoyment for their leisure hours; and they find it all in the pursuit of the pigeon fancy, which answers most exactly in all these respects to the culture of flowers.

Like the florist, the pigeon fancier seeks to develop what he calls the "beauties" of his pets, and, artificial as his ideals are, they are scarcely, if at all, more so than those of a gardener. No one feels surprised that men should love flowers, and as our natures are not all alike, some of us cannot have flowers; some of us want more return than flowers can give. We would have their beauty, but we crave an eye that can meet ours, a pet that will welcome our approach and show that our regular visit is a joy to it. If only the beautiful flower could turn round at our coming; if it could acknowledge gratefully the refreshing shower we bestow upon it; if it could meet glance with glance, to show us that it shared the joy of every meeting; if, I say, a flower could do all this, then it would answer in nearly all respects to a fancy pigeon. To the true fancier, his pigeons are just such beautiful, rare, *living flowers*.

The pigeon fancy is assuming vast proportions in the United States. Within the past 20 years the buying, selling and importation of pigeons have caused to spring up a number of business houses devoted entirely to the purpose of supplying such pets. Germany and England are the countries from which the largest number of birds are imported. The love for pets evinced by the people of both nations has produced, within the last few centuries, numberless combinations of colors and points of greater interest in this class of the feathered tribe. Each of these people has, however, had its own peculiar fancy. The Germans, living so near the birth-place of fine art, have devoted their time and skill to the production of brilliancy of coloring or odd contrasts of colors, and the toy birds have issued from their hands in every conceivable combination of hues natural to pigeons or striking to the eye. The English, on the contrary, turned their attention to shape, or whatever was odd and curious, and by long selection and careful breeding, have obtained what are called the high fancy birds; viz: the English Pouter, Carrier and Almond Tumbler. We Americans should be thankful that those two nations devoted themselves to such opposite purposes. Between them they have worked to our advantage We now have all the varieties ready-made to our hands, whereas, if both had worked towards the same desires, there would have been a much shorter and more imperfect list to choose from.

I will not, however, infringe further on the valued space of our esteemed RURAL, but in a subsequent number, will speak of the several varieties and in regard to their breeding.

A New York Poultry Account.

HAVING had some experience in poultry raising, I give it for the benefit of RURAL readers After I left school in June, 1878, I commenced taking charge of father's hens and am still in the business. I kept an accurate account of everything the first year. Although I do not think the record is extraordinary, it shows that hens can be made to pay their way. My account is as follows:—

Amount received for chickens and eggs sold	$50.63
Amount paid for feed, repairs and losses	25.22
Profit	25.41

We kept about 25 hens which were a mixture of Brahmas, Leghorns, Houdans and barnyard fowls. We used $12 95 worth of eggs and poultry at home. I have made the hen house warmer by battening and banking, as it was formerly so cold that we got very few eggs in all winter, but now the hens lay about as well in winter as in summer. I fed corn, oats, wheat screenings and corn meal and wheat bran dough—the last on the coldest days. I gave the hens burnt bones and egg shells broken fine often, and fresh meat occasionally. Last spring I had several sick hens; one died and I opened her crop which was filled with some charred corn I had fed them. I gave the others each a "Parson's pellet," and they all recovered. I received all of my instructions in poultry raising from the columns of the RURAL. L. L. ALLEN.

Jefferson Co., N. Y.

A Southern Poultry Account.

I started in on Jan 1. '79 with 30 hens and two cocks, pure-bred and grade Houdans. This number was much reduced one way and another, so that when the last day of the year came around I could strike the average at 23 hens; 10 of this number hatched and cared for chickens. No pullets laid during the fall. The hens were one, two and three years old. They were allowed unlimited range; were liberally fed with corn twice each day except during June and July when the wheat fields furnished ample foraging grounds. They were never permitted to become lean or lousy. In this climate, there are few consecutive days when dry earth for wallowing is not to be found without special provision. A few burnt bones were the only addition to their diet besides that mentioned above. Results as follows:—Eggs gathered Jan. 144; Feb. 311; March, 432; April, 407; May, 221; June, 291; July, 273; Aug. 145; Sept. 77 molting; Oct. 184; Nov. 124; Dec. 177. Whole number 2,786 or 232 1-6 dozen. Average price for the year 12⅓c. per dozen. "Nothing to brag of" to be sure. Still I am pretty well satisfied with the results. No account was kept of the corn.

Warren Co., N. C. M. P. PRINCE.

Everywhere.

NOTES FROM WESTERN ARKANSAS.

THE total area of this State is 52,198 square miles, making a total in acres of 33,406,720, of which 16,257,641 acres are on the tax books, leaving the enormous amount of 17,147,187 acres which is non-taxable, and affords no revenue to the State. Of this large amount, the United States Government owns 7,000,000 aces, which are subject to homestead, in quantities of 40, 80 and 160 acres, according to location, under government laws, or for sale at $1.25 per acre; much of which is valuable and will be made a source of revenue to the State. The greater portion of these lands lie in the west, northwest and southwest sections of the State, and it only requires the small sum of $14.25 to secure a home of 160 acres. The school lands are the 16th section of each township, comprising 640 acres, which are set apart for school purposes and for sale at 50 cents per acre. Of forfeited lands, there are over 3,000,000 acres, which have been forfeited to the State for taxes, and are for sale at 50 cents per acre, or subject to donation to heads of families in quantities of 160 acres, the fees for which amount to $6.00. No other State offers such a munificent donation, or such splendid opportunities for heads of families to acquire a home. The person applying for a donation, must accompany the application with the sum of $5, take an oath that it is for his own use and not for speculation, and within eighteen months present to the land department, proof that ten acres have been cleared and put in cultivation, accompanied by a fee of $1, and he will secure his deed to the land. No building is required. Thus, in our State a head of a family, if he be a citizen of the United States, if he finds United States Government and State lands lying side by side, can homestead from the Government 160 acres of land, by paying say, $15 in money, and secure a donation of 160 acres more from the State of Arkansas, by paying $6; making in all 320 acres of land, such as may be secured out of millions of acres, for the sum of $21. What country on earth offers such a grand inducement to the home-seeker? In addition to these lands, there are the railroad lands, which are offered to the immigrant on terms as favorable as any one can ask. These lands can be purchased on seven years' time, at six per cent. interest, and heavy discounts are made for part or all cash. If none of these lands suit the purchaser or home-seeker, he can usually find improved lands for sale at prices ranging from five to fifteen dollars per acre.

Agriculturally viewed, western Arkansas has no superior. We can grow of cotton over 500,000 bales, worth over $20,000,000. The State stands first as to growing hay and tobacco per acre, second as to cotton, third as to oats, and grows equally with other States, almost all the cereals and small grains, grass, etc. In fruits we stand behind none; raising the finest peaches, apples, plums, cherries, apricots and all kinds of berries. In most parts of western Arkansas stock-raising is profitable, and can be made equally so with the famous blue-grass regions of Kentucky. We have natural pastures both summer and winter, and whenever there is a scarcity of feed, the winters are so mild and short that stock is put through till spring with but little expense. In no part of the world can the laboring man and the poor man more easily support and educate his family than here. Such are our advantages, that with moderate means and energy, all prosper.

The mean temperature at Little Rock, the geographical center of the State, for the twelve months ending July 31, 1879, was 56 deg. Fah. The highest thermometers were July 14, and 15, 1878, which reached 99 deg. Fah. The lowest mean, January 5, 1878, 12 deg. Fah. The rainfall throughout the year is more uniform, owing to physical causes, than in adjoining parallels. Thus, western Arkansas is exempt from the extreme and suffocating heat of more southern latitudes, or the extreme and severe cold of sister States in more northern latitudes. While there has been no rapid influx of immigration to our State, such as has been experienced by Kansas and Texas, yet there has been a constant, steady flow of a more certain, steadfast and profitable class of settlers, than to either of the States mentioned. R. B

Sebastian Co.

RURAL SPECIAL REPORTS.

ARKANSAS, Greenwood, Sebastian Co., Feb., 9.—Since the first of January the weather has been like May. Farmers have been busy plowing for oats and spring crops. Making garden is now the order of the day. Cotton holds its own at 11c. and 11½c. a pound. The recent warm weather has damaged considerable quantities of pork; consequently the price of bacon has increased to 11c; corn has fallen to 60c; flour per 100 lb. $4; salt per bbl. $3.40 oats 60c; butter, 22c@40c; eggs, 20c; Irish potatoes $1@1 25; sugar, 9@13c; coal oil, 30c; onions $2.50; wool 44@48c. R. R.

ILL., Dixon, Feb. 5.—White Russian spring wheat has been found not to answer in this part of the country. I've tried it three times. It is too late, however, and blights in the head. Last fall I thought I would try it as a winter wheat, it looked and grew so much like that sort. I drilled it in but it is dead. I also drilled in 16 bushels of Odessa wheat, which looks all right although it is used as a spring wheat. W. G.

IOWA, Brooks, Taylor Co., Feb. 12.—It has been quite spring-like all winter, only one cold week and that in December. Not any snow to speak of. Quite a large amount of winter wheat was sown here last fall. I cannot tell yet how it will stand the sudden changes of the weather: I have fears it will not be a paying crop. Corn is our staple crop, yielding from 40 to 75 bushels per acre, and farmers that are not troubled with hog cholera are making money even at the low prices we are getting. We grow almost all kinds of fruit in abundance. Land is cheap—wild land $8 and $10 per acre; improved from $10 to $20 and $25, all well watered with streams and springs. Farm products have for the last few days dropped off paying prices. Wheat is worth from 70c, to 80c.; corn, 20c.; oats, 25c.; of rye and barley not much was grown last season; potatoes 40c.; butter, 20c. per lb.; cattle, from $3 to $4; hogs, $3.50.

I wish to say one word to my brother farmers that raise large crops of potatoes. In my mode of planting I use a riding corn cultivator; attach the fifth tooth. Make a small conductor large enough to freely pass pieces of potatoes and long enough to reach from behind the middle tooth to the seat, or forward of the seat; place an old boiler or a half-bushel or anything that will hold from half to one bushel of seed potatoes, forward of the conductor; put a board across forward of that for the boy that drives; set the teeth on both sides to turn the soil on the potatoes, and turn the measure down towards you when you are on the seat, so that the top of the measure will be even with the top of the spout so you can pass the seed into the spout without taking it up in the hand. Have the ground well pulverized before planting. The wheel track will guide you for the next row. After a little practice one can drop as fast as the team will walk. I have planted eight acres per day with it. J. T. S.

IOWA, Davenport, Feb. 12.—I was very much pleased with the RURAL'S remarks on the Mexican sweet corn, in the issue of Jan. 24. I have raised it for my own use for the last 10 years. Discarding all others I plant it in succession three or four times during the season, the last time from the 20th of July to 1st August. By this means one can have green corn until frost kills it, and it is the best of all the sweet corn for a person's own use; but it is not a good market corn on account of its color. We are having a very remarkable winter here. It has been like spring ever since Christmas. Roads are very bad. Farmers cannot come in, consequently produce is very high for this place: wheat, No. 2, spring, $1.10; winter, $1.18; corn, nothing doing in the way of shipments, 24@27 cts.; barley dull at 57 cts.; oats, 36 cts.; potatoes, Early Rose, 40 cts., Peachblows, 55 cts.; onions, 1.50@$2 per bus.; butter, 25 cts.; apples, light in supply, 3.75@$4 per bbl.; cabbage, 40cts. per doz.; chickens, 7cts. per pound; turkeys, 10 cts.; geese, 10 cts.; ducks, 8 cts.; eggs, 20 cts. Everything is high; but would be cheaper if roads were good. G. W. S.

IOWA, Felix, Warren Co., Feb., 5th.—The present winter has been very pleasant; very little snow or rain, ground frozen almost all the time. Our country is mostly prairie with plenty of timber along the streams. Improved farms sell for $20 to $30 per acre. It is a good corn, oats and grass country. Spring wheat is raised, yet it fails some years. Ten times more fall wheat was sown last fall than ever before, but it is the general opinion that the most of it is winter-killed; wheat is bringing in market from 90c. to 95c; corn, 22c; oats, 26; potatoes, 30c; cord wood $1 to $1.25; hogs, $3.75 to $4 per 100 lbs. J. H. A.

IOWA, Washington, Feb. 9.—We have had a very mild winter so far. A part of the time it was very disagreeable on account of mud. For the past two weeks it has been April weather without the showers. Fall wheat will undoubtedly be a failure in this section of the country on account of the alternate freezing and thawing. W. R. B.

KANSAS, Edgerton Feb., 11.—We are having a mild open winter. The weather for the past six weeks has been delightful. Wheat is generally looking well throughout the State, (as *I know* by personal observation), and there is a much larger acreage sown than usual. Farmers can now see the difference between early and late sowing. While the former is green and well rooted, with every prospect of making a good crop, the latter is brown, and considerably thrown out by the frost. The fruit prospect so far is good. If the warm weather does not swell the buds too much before late frosts, we shall probably have a large crop, as the crops for the last two seasons have been light. This is a healthful country, and a good climate. We have good markets, good land, and cheap, good schools, churches enough and good society, and it is a good place for any honest, industrious man to secure a home. A. B. D.

MICH., Cleon, Feb. 12.—We are having what the local papers here call a kangaroo winter, I suppose because it jumps from one month to another with a short cold spell in each. Farm crops were very good here last season. Corn was cut short somewhat by a drought in July and August, which lasted about six weeks. A neighbor told me to-day he was offered 50 cents a bushel for his oats at his granary. Corn is selling for 50 cents for 70 pounds of cars; wheat, $1.12 per bush. in market; hay, $15 to $18 per ton in barn or stack. Good wild land can be bought for from $3 to $8 per acre. J. S. G.

MICH., South Lyon, Oakland, Feb., 7.—No snow; weather very mild; winter wheat looking well; clover killed out; wheat—Clawson—worth $1.15; corn, 50c; oats, 30c; buckwheat, 80c; potatoes 40c; butter, 16c; eggs, 12; live hogs, 4c; fat cattle 4c. to 4½c; fat sheep 5c; stove wood $1.00 A. B.

MO., Springfield, Greene Co.—It is extraordinary that while portions of this country have been visited with heavy snow and most intensely cold weather, we here on top of the Ozark Mountains have had comparatively *no winter*. Up to the end of January the ground had not been covered with snow, nor had the frost been sufficient to prevent the plow, excepting a small portion of the time. Wheat and blue grass have been growing all the winter. Sheep are happy with green pasture and ignore dry food. All stock have a good time, so dry and warm is the season. Cattle and hogs have gone upon the market in better shape from less food and in shorter time than usual. Of course, we enjoy it too, but with some fear that our absent snow and frost may come home in March or later. Never before had we such promise of a large fruit crop of *all* fruits common here. The dry summer and autumn prevented the usual growth of wood in our orchards, and instead every tree is full of fruit buds. We have feared the buds would be so advanced by absence of cold weather as to be killed by frost, but all is right yet. Nothing is lost but the bees. They have nearly all died in this locality; we think it is from the effect of long and severe drought. There was a very large acreage of this county sown to wheat last fall, perhaps never so much before, and as the season for the work was favorable, it was well done, and the many, many broad green fields at this time look very beautiful, promising a large yield. Business in Springfield is much improved; merchants are busy and happy. Receipts of cotton from the western border of our sister State, Arkansas, are unusually heavy. Wagon trains, laden with this staple, are upon the road and streets every day in large numbers. We think this a most lovely part of the "Great West," but we need more transportation—more railroads, and they are coming. JOT.

PA, New Lebanon, Mercer Co. Feb. 7.—The winter in these parts has been very open and warm. We had a good deal of rain and mud up to February. This month so far has been quite cold. The wheat crop, owing to the start it got in the fall, and the mild winter, looks well and promising thus far. The crops of last year were good, taking them all together. Fruit was plentiful, especially apples. Prices: wheat, $1.10 per bus.; oats, 38 cts.; corn, 28 cts.; apples, 50 cts.; potatoes, 35 cts.; butter, 20 cts. per pound; eggs, 20 cts. per doz. R. C.

TENN., Humboldt, Feb. 3.—Our first snow this winter now covers the ground 12 inches, an unusual phenomenon for this section at this date. Wheat looks well—tillering finely. Owing to wet weather and the cotton "boom" not half the usual area has been sown. B. F. T.

WIS., River Falls, Pierce Co., Feb. 16.—Crops last year were, on an average, pretty fair. Wheat averaged about 15 bushels to the acre; but was not of the best quality; corn, 150 baskets per acre; oats, 64 bushels per acre. The fruit crop was very fair. We had good yield of currants, raspberries, grapes and apples. Our standard apples are the Red Astrachan, Summer Rose, Rawle's Genet, Johnathan, Rhode Island Greening, Rock Russet, Ben Davis, Golden Russet, Early Harvest, Duchess of Oldenburgh, Gen. Grant (?) and Wealthy, and these are all doing well. Our standard Grapes are the Isabella, from which I gathered 200 pounds; Delaware, 156 pounds; California raisin grapes, 15 pounds; Clinton, 75 pounds; These are all doing well and stand the winter admirably. G. W. H.

WIS., Wiota, Lafayette Co., Feb. 10.—We have had a remarkably open winter. The ground is now bare and we have not had a day of passable sleighing yet and probably not six inches of snow in all, and but a very few days of severe cold. Generally we have had freezing of nights and thawing slightly during the day, as is usual in November. A much larger area of wheat than has been sown for many years was put in last fall, and such weather must be very trying to it, especially to the late sown. Mine was sown the first week in September and doesn't appear to have suffered any yet. W. F.

The Querist.

ANSWERS TO CORRESPONDENTS.

When to Thrash Wheat.

C. R., Highland, Ill., asks some information as to the best time for thrashing wheat—either from the field a few weeks after it has been harvested, or from the stack. In that part of the country the majority of the farmers find that thrashing from the field saves a great deal of trouble without causing any injury to the wheat either in weight, soundness, plumpness, or keeping properties of the grain in the granary, which has never heated at all, although the thrashing has sometimes been done within 15 days after harvesting. The cause of the practice of thrashing thus early was the damage done by the weevil to the wheat in the stack and afterwards in the granary, and experience thereabouts proves that wheat thrashed from the field hardly ever suffers from insects, while if stacked its value is often lessened one-fourth by these pests.

ANS—No one is better able than our correspondent to answer for his locality the questions he asks. If the facts are as he states in regard to weevil—and we see no reason to doubt it—and if there is not too great a risk to the wheat from storms, then we should say the best way would be to thrash from the field as soon as the wheat is dry enough not to damage by heating in the bin. The practice, however, of leaving wheat in the shock till thrashing time, has been mostly abandoned in the wheat regions of N. Y., Ohio and Michigan, on account of the uncertainty of the weather. Often in those localities heavy rains after harvest sprout the wheat badly, if left long in the field, no matter how well it may be shocked. The plan of thrashing from the shock often involves delay at thrashing time, too. If the wheat is *in the barn* or even stacked, the thrashing need be interrupted only during the actual continuance of a shower. But if it is in the shock, the machine and man may have to wait a day or more for the wheat to dry. Again, one steam thrasher often thrashes many thousands of bushels in a season. But this would require some of the wheat to be left in the shock several weeks, which is quite unsafe except with a climate, like that of California, free from rain, The general practice, therefore in the States named, is to put the grain in the barn or stack about four or five days after it is cut, and let it remain till the sweating process is over, and hot weather and hurry about plowing and seeding wheat are over too, and then attend to the thrashing. But each locality must decide for itself what is best for its own climate and circumstances.

Brain Bladder Worms in Sheep.

F. E., Fairview, W. Va., asks what is the matter with his lambs. When first attacked they go round and round with the head on one side, as if there were something in the ear. This lasts for one or two days, when they get too sick to walk, and when lying down, their eyes keep rolling rapidly.

ANS—If you open the head of one of the lambs by sawing carefully around the skull and lifting off the bone, so as to expose the brain, you will probably find some parasitic worms. These consist of bladders filled with fluid in which the worms exist. The worms are known as brain bladder worms (Cœnurus cerebralis), and the pressure and irritation on the brain produced by them, cause the sheep or lamb to turn round in one direction, holding the head on one side or downwards meanwhile. They are tape-worms in an embryotic condition, and are introduced into the sheep on hay or grass upon which eggs are adhering; these being dropped by dogs in their excrement. In the sheep these parasites never mature, but arrive at their final growth in the intestines of dogs. The bladders are from the size of a pea up to that of a hickory nut or even a hen's egg. As a relief, (there is no cure) give a dose of two ounces of linseed oil, give some light but nutritious feed, and keep the stomach and bowels free from repletion.

When the head of a sheep containing these bladder worms is devoured by a dog, the larvæ are transformed within him into tape-worms. These worms at maturity, or the eggs, having been voided by the dog on the pasture, are swallowed by the sheep, hatched in the stomach, and penetrate to all parts of the body, perishing everywhere except in the brain, their usual habitation. One dog will void thousands of eggs, some of which attached to the anus are dropped in a multitude of places. Old sheep are seldom attacked. To prevent the spread of the disease, therefore, it is only necessary to prevent dogs from devouring the heads of affected sheep, or to keep them from

pasture. The heads of sheep dying fro m the disease should be burned — not thrown away.

Wool Waste.

O. W. F., Blakestone, Mass., asks how to make manure from the waste of woolen mills, which he can have for drawing it two miles.

ANS.—These are a very valuable fertilizer. Wool contains 17 per cent. of nitrogen or 340 pounds in a ton; nitrogen is valued at 25 cents a pound when in a condition to be made immediately available. Woolen waste decomposes slowly, and while it is not of immediate use, and therefore not so valuable as a material containing active forms of nitrogen, yet it is permanent and of lasting value. If the nitrogen in it is worth half as much as that in guano, the waste should be worth about $40 a ton, at which price it is often sold for a fertilizer. English farmers buy it for $25 to $50 a ton. The samples sent are numbered in about their relative value. If mixed together, they are a very good sample of the waste of a factory in which shoddy and inferior wool are used, and which consists of short fibers of wool with some dirt and other foreign matter. This waste is specially valuable for hops, and is forked in about the roots; it is usually spread upon grass lands before they are broken up for corn or wheat, and is plowed in with a light furrow. This is the best manner of using it, as it is in no way improved by laborious methods of composting. It is equally valuable in whichever way it is got into the soil, the only thing to consider being to get it mixed as evenly and as near the surface as possible, and yet have it covered.

Salt.

C. W. W., Lowville, N. Y., wants to know how our salts are made, and what is the difference between common salt and "factory filled;" 2, is lime used in the manufacture, and 3, are not Ashton and Higgin's salts imported?

1. Salt is principally made from brine pumped from wells which are sunk to the natural salt deposits, and this brine is evaporated in pans. The difference in quality is largely due to the purity and freedom from deleterious matter of the brine; also, to the method of manufacture and the care taken during the process. The term "factory filled" was one adopted many years since in contra-distinction to the term "Liverpool ground," which was the commonest grade of salt made, and which was usually shipped in bulk. The term is now applied more or less indiscriminately to most of the brands of English salt. 2, We are not aware that lime is used in the manufacture of salt, but all brines contain more or less lime, and it is a fault with American brines that they contain a large percentage. 3, Ashton's and Higgin's brands are both imported; the latter is made by a new process for which the English Government has granted a patent, and this, it is claimed, is as great an improvement in the manufacture of salt as the Bessemer process is in that of steel. We are informed that the importations of this brand have increased in four years from six thousand to over ninety thousand sacks per annum.

Dairy Cows and Sheep.

E. H. G., Watertown, Mich., has had some experience with blooded stock, but has generally bought in a high and sold in a low market, and he asks whether sheep and dairy cows go well together—he has some $25 Merino sheep

ANS.—Dairy cows and sheep go very well together, as sheep can go on the pasture and eat off what cows reject. But it will not pay to keep $25 sheep for wool or mutton when a common native ewe will bring as good a lamb and at least half as good a fleece, at a cost of $3 or $4. We have this opinion of blood stock, that it will not pay the ordinary farmer to keep them if he has to purchase at a high price. Let the breeders breed them and let farmers cross them on their best native stock by buying good bulls and so raise grades of gradually improving character. The ambition to possess some costly cattle has frequently injured and sometimes ruined farmers, who cannot make money out of $200 cows or $25 sheep, or $50 pigs which will rarely be more productive than half-bred animals which will not cost more than a fourth of these values We consider dairying as the most certain and substantial branch of agriculture, and it is certainly the least exhaustive of the soil. If there is one farmer better off than another to-day, it is the dairyman who keeps good native or grade cows and feeds them well.

Malignant Anthrax or Black Leg.

J. J. R., Pulaski, O., asks for a preventive and remedy for a disease that is playing sad havoc with cattle in that neighborhood, and wh ch he describes.

ANS.—This is evidently "Malignant Anthrax" and the disease runs such a rapid course that there is little time for remedial measures before death takes place; therefore at once endeavor to secure the balance of the herd from this disorder. Give to each one of the herd a good purge, from one-half to one pound of Epsom salts according to age of animal, follow with two-drachm doses of chlorate of potassa or saturated solution of quinia, or common salt or small doses of turpentine twice a day (dose dessert-spoonful mixed with white of egg or linseed oil). If possible remove the animals to another location and change their manner of feed; quality and quantity must be good and generous. Drain lands and disinfect barns and sheds. Bury all animals that die of the disease, as it is highly contagious, and be careful in handling the carcasses, as human beings are liable to contract the malady if infected by the poisonous principle through wounds in the hands or person.

Cotted Wool.

L. L. L., Northeast, Pa., asks the cause of wool cotting in a sheep's back.

ANS.—Cotted or felty wool is caused by low condition of the sheep; by a natural deficiency of yolk and exposure to wet, or by a constitutional defect. Under some circumstances it is the nature of wool to felt and mat together. These are, moisture, warmth, pressure and the presence of alkaline grease (soap) in the wool. When a sheep is exposed to rain and the fleece is soaked, the yolk (which is a true soap consisting of potash and oil) is dissolved, and when the sheep lies down the wool is warmed and pressed together. The result is precisely the same as when a felt-hat maker takes a handful of wool, dips it in hot, soapy water, and presses it with his roller. The fibers of wool being armed with interlocking scales, these become entangled and the wool is matted together—the matting being assisted by shrinkage. Some sheep inherit the fault, and a thorough wetting of the fleece is followed by shrinking and cotting. Others are deficient in yolk for want of good feeding, and the wool, being insufficiently lubricated with this oil or grease, is felted when the fleece is soaked with water.

Egyptian, or Rice Corn.

A. A. S., Macon City, Mo., asks where Egyptian or Rice Corn can be had; he has seen it recommended as better than corn.

ANS.—It is advertised in our columns and several of the seed catalogues noticed in our columns of late. We have raised this and other varieties of sorghum vulgare, valued either for grain or for fodder. Its value as a grain is not fully determined, though in nutritive qualities it is thought to be inferior to corn. There is one variety that throws up 8 or 10 stalks from a single seed, taking so firm a hold of the soil that it is seldom lodged by high winds. This proved with us last summer one of the most valuable fodder plants we have ever raised. The seeds were marked "Doura," though we find that other seeds, so called, throw up but a single stalk, and are valuable for grain chiefly. We should have added this to our Free Seed Distribution had we been able to procure seeds known to be the tillering sort in sufficient quantity for that purpose.

Flax Culture.

J. R., Outagamie Co., Wis., asks for information about flax culture.

ANS.—Flax requires good soil. Moist, rich meadow land newly plowed, or new prairie land is excellent for this crop. A bushel and a half of seed per acre is sown, and the treatment is much the same as for oats or any other small-grain crop. Thin seeding encourages branching and the formation of seed stalks, although the best fiber is produced from a thickly grown crop cut before the seed is mature. When both seed and fiber are required, moderately thin seeding is practiced. The yield common in the Western States is 12 bushels of seed and one ton of straw per acre, although a good crop should produce 25 bushels of seed per acre. Flax leaves the ground in a good condition for wheat, as it shades and mellows the soil as much as buckwheat or peas.

Cow-peas Again.

G. S., Spring Lake, Mich., asks where can Cow-peas be obtained by the bushel, and whether they are likely to thrive in that latitude.

ANS.—We beg again to call attention to our notices of catalogues in late and future numbers of the RURAL NEW-YORKER. Most of them will be forwarded to subscribers without charge. Some of our acquaintance and exchanges state that the RURAL, in its advocacy of a trial of the Cow-pea, is but bringing up an old failure to be again tried and to be again proven a failure. This may be. It will be tried in a small way during next season by not less than 10,000 farmers of the North, and their reports will determine, as it has never been determined before, whether the Cow-pea for certain purposes is of any value or not.

Planting Doura, etc.

D. T. K., Lebanon, Va., asks, 1, for the best cheap feed cutter; 2, how to plant Doura.

ANS.—1, There are many excellent feed cutters, the relative merits of which we do not feel at liberty to pronounce upon. Our inquirer had best write for catalogues and circulars of those advertising in our columns and judge for himself. 2, As to Doura, we last season, prepared our land as for corn, marking off the rows four feet apart, and dropping one seed every six inches in the row Then at the first hoeing, hoe out the plants so as to leave them 18 inches apart. This is for the Doura that sends up an average of eight stalks. For the drooping kinds that have but one stalk leave six inches.

Miscellaneous.

E. L., Fall Creek, Wis., asks, 1, how long can a ram be used on the same flock of sheep without producing any ill effects on the offspring; 3, is there any benefit in grinding the cob of corn with the grain as cattle feed; 3, is the Big Giant corn mill a good machine; 4, would walnut trees planted among fruit trees keep insects away, as he has seen stated in some papers.

ANS.—1, Although in the hands of skillful and experienced breeders, good results have attended in-and-in breeding, yet general experience shows that while to breed a ram to his own lambs may be permitted, to breed to the second generation of offsprings should be avoided. To change the ram the second year would be to act on the side of safety, and except in rare instances, and for the attainment of definite results, this should be the limit of close breeding. 2, The results of some recent experiments in this connection are fully set forth by Prof. E. W. Stewart in RURAL for Feb. 7, and epitomized in notice of the I-X-L. mill in RURAL of last week, and to these we must refer our inquirer. 3, Yes. 4, If such were the case the entomologists and pomologists of the world would long ago have found it out and been saved a world of trouble.

O. S. B., Burdett, N. Y., asks, 1, what the difference is between potash and pearlash; 2, where can these products be bought at the prices quoted in N. Y. market reports, and which is cheapest to put around trees—potash or pearlash; 3, what are Mapes's fertilizers, and where can they be had; 4, the address of a reliable dealer in commercial fertilizers nearest to his place.

ANS.—1. Pearlash is the name given to potash after it has been heated in a reverberating furnance. It contains more carbonate of potassium, and less sulphur and other impurities than potash. 2. Of wholsale druggists. Potash will be the cheaper. 3. They are what are called "special" fertilizers, containing all the ingredients of plant food needed by the crops they are made for, and which are usually not supplied in sufficient abundance by the soil. They can be had from the manufacturers, 158 Front street, this city. 4. Crocker & Co., Buffalo, N. Y., are as near as any.

W. S. M., Bendersville, Pa., asks information about late kinds of potatoes and especially about certain named varieties, such as the Dunmore, etc.

ANS.—The Dunmore is a fine potato. Send for J. J. H. Gregory's Catalogue (Marblehead, Mass.) Send for Bliss's Potato Catalogue (B. K. Bliss & Sons, 34 Barclay St., N. Y.) Look over the Potato Number of the RURAL NEW-YORKER. The catalogues in general noticed every week in our columns will best answer such questions. Indeed, there is scarcely a point relative to potatoes and their cultivation that has not been treated in the RURAL NEW-YORKER for 1879.

C. H. E., Montgomery, Mich., asks whether the Dhoura or Chinese Corn referred to in a work he has, is the same as the Doura spoken of in the RURAL; 2, if so, should he get the White Dhoura or China corn.

ANS.—We cannot say, not having tried and but little trust can be put in variety names. Our seed was presented to us by R. H. Allen & Co., (box 376, New York City) as Doura and it was from this seed that an average of eight or nine stalks grew. It is the only variety of Sorghum vulgare that we deem of much value as a fodder plant. The others are valuable chiefly for their grain.

J. F. A., Saline, Mich., asks, 1, which are the best varieties of beets and turnips; 2, is there a potato superior to the Early Rose that is as early; 3, which are the best three varieties of potatoes; 4, is this a good time to trim apple trees.

ANS.—1, We have found the Beauty of Hebron as good in quality as the Early Rose and far more prolific. This has been the verdict of a majority of the thousands to whom we sent the potato last year. Whether it will prove of more value to you can be ascertained only by trial. 3, Early Ohio, Alpha, Early Snowflake. 4, Yes, this is a good season of the year for pruning fruit trees.

G. A. C., Queens Co., L. I., sends a little bulb which formed on the stem of a Lily in her greenhouse, and asks whether such bulbs will produce plants like the parent, and what causes them to form on the stem.

ANS.—These are really axillary buds which finally drop off and, if covered by soil, grow and propagate the variety or species. Bud variations are not uncommon, but generally variations occur through seminal or seed reproduction.

R. A. W., Genesee, N. Y., (see page 91, RURAL) can procure the Onondaga Grape of Smiths & Powell, Syracuse, N. Y. It originated at Fayetteville, Onondaga Co., N. Y., and is described as amber-colored, of good size, thick skin, very sweet and fine, the flavor resembling both Delaware and Diana of which it is probably a cross. Personally, I have no knowledge of the value of this grape. It is probably worth a trial. N. R.

P. M. L., Laceyville, Pa, asks whether hen manure and ashes would be as good for potatoes as for corn, and how much should be applied to each hill.

ANS.—Hen manure and ashes are good for any crop. About half a gill will be enough for each hill. Should be mixed with the surface soil and not put together until just before or at the time of application, as otherwise the contact with the ashes would set free much of the ammonia in the hen manure.

W. S. P., Adams Station, N. Y., asks, 1, what kind of artificial manure is best for Raspberries, and 2, which is the cheaper—artificial or stable manure, the latter costing one dollar a load and then to be drawn five miles.

ANS.—1, Bone flour and sulphate of potash are good. 2. Good stable manure is cheap at that price, and if it can be drawn at a time when the team would otherwise be idle and over a passable road, we should consider stable manure the cheaper of the two.

V. B., Phillipsburg, Kan., asks 1, whether beech nuts should be frozen to produce germination; 2, where can he procure the Tulip tree.

ANS.—1. Freezing seeds never increases their germinative powers. The most important consideration is to keep them moist—not wet—and thus prevent their becoming dry and hard. 2. Tulip trees can be procured of any nurseryman.

C. C., Damascus, Pa., bought two trees of Paulownia imperialis a few years ago with the assurance that they were hardy; they were, however, winter-killed, and he now asks if it is worth while to try it again.

ANS.—Our friend's own experience ought to enable him to judge. Paulownia cannot bear hard frosts, and except in very mild winters, will winter-kill in the above latitude if not protected.

A Subscriber asks, what is the difference between white and bronze turkeys.

ANS.—There is no recorded difference between white and bronze turkeys except in color. Some assert that white are more delicate, but experience does not prove it to be so.

O. E. T., Chicago, says that she has used a linseed oil barrel for a window garden for two winters and failed each time, while with the same kind of soil used in jars, she succeeded and she asks whether the fault is in the barrel, and if there is a remedy.

ANS.—We have no experience as to this.

A Reader, Monroeville, N. Y., having plenty water convenient, wishes to try irrigation and asks for the experience, as to the best way of distributing the water, of any RURAL reader who has practiced the plan.

A. J. P., Johnston, N. Y., asks when is the best time to trim a hedge of the Norway Spruce.

ANS.—About the beginning of August. Trim off about three-fourths of last season's growth. Simply disbudding in September or pinching back the spring growth are good plans.

A. Z. B., Guilford, Kan., asks for the best way of starting red cedar seed.

ANS.—Sow in a seed-bed in the fall.

See advertising columns.—W. H. W. for hand seed drill; R. H. and others for fetilizers; W. N. C. for Doura.

L. & W., Marianna, Ark., see Farm Economy.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
78 Duane Street, New York.

SATURDAY, FEB. 28, 1880.

As announced in our late issues, we can no longer supply back numbers of the Rural New-Yorker. Papers will be sent for one year from the date of the receipt of all subscriptions.

COMPETITORS for the book premiums offered by the Farmers' Publishing Co. for the heaviest weight of Blount's Prolific Corn from seed sent out by the RURAL NEW-YORKER, should send us their reports without further delay. We simply want a certified statement of the actual weight of the corn, weighed three months after date of harvesting; the weight per bushel is not required.

NOT long since we received through a Western Newspaper Agency, among others, an advertisement of the Voltaic Belt Company, of Marshall, Mich., amounting to $160 net. Later, and upon reliable information, we learn that the Company is untrustworthy, and hereby warn our readers against sending for any of their goods. Their advertisement has been thrown out, and we hope none of our readers will have been swindled before this warning reaches them.

WE have stated more than once that the RURAL NEW-YORKER'S Plant and Seed Distribution is not only free to our yearly subscribers who apply, but that (in the present instance at all events) we should share a part of the postal charges. Our subscribers will kindly note upon the receipt of their plants and seeds whether or not we have done so. We would also ask them to compute (estimating our circulation as they may) the aggregate cost to us of such postage.

OH, yes; undoubtedly James Gordon Bennett "gave that $100,000 as an advertisement," and the starving poor of Ireland wish there were more just such advertisers.—Boston Post. In this connection we beg permission to make a remark: If *per se* there is nothing disreputable about advertising, why should so many papers sneer at Mr. Bennett's advertisement, which, besides advancing the interests of an enterprising newspaper, puts food into thousands of hungry mouths?

WE hear nothing of Miner's Grapes. We mean the late T. B. Miner, of Linden, N. J. But we venture to predict that some of them will prove more valuable than many of the hybrids now so much talked of, and adapted to a wider range of country. We have six kinds of these seedlings, a majority of which bid fair to fruit next year, that were sent to the "Rural Grounds" by Mr. Miner to be tested about a year previous to his death. They have made a sturdy growth, and no appearance of mildew has presented itself, while one vine of the "Lady" and another of Ricketts's "El Dorado," growing within twenty feet of them, were badly mildewed.

ELKHORN, WIS., Feb. 16th, 1880.

EDITOR OF RURAL NEW-YORKER,—*Dear Sir:*—Wishing to express my gratitude to you for the Silver Cup offered to the Wisconsin Dairymen, I ship you to-day, one 22-pound package of creamery butter, the same as won the Silver Cup. We valu the cup very highly, not on account of its intrinsic value, but for its rare and elegant beauty, as well as because it was honorably won. Trusting that the acceptance of the butter will afford you as much pleasure as is given me in the presentation, I am

Very Respectfully Yours,
SAM'L LYTLE.

[The butter is beautiful—of excellent quality, and we return our best thanks. EDS.]

WE desire to remind our readers who seem to take for granted that our agricultural prosperity has only begun, that they do not attach enough importance to the extreme agricultural depression during the past year in England and other European countries as an essential cause of our prosperity. Such a combination of bad seasons and failure in crops abroad is unlikely to occur this year again, and it may reasonably be feared that our farmers may find it a difficult matter to sell the immense yields of wheat which are promised by its present condition and greatly extended acreage, at remunerative prices. We hazard the prediction that the present wheat craze will have passed its zenith in a rapid decline, ere the crop of 1880 is well harvested.

THE action of the New York State Dairymen's Association in selecting its officers for the current year from among the farmers of the State is worthy of imitation by Agricultural Societies everywhere. Farmers have been much too often represented in nearly all their associations, as well as in the State and National legislatures, by outsiders who have had but little personal concern in agricultural matters, and whose individual interests have sometimes been inimical to those of their constituents. There are among us, the farmers of the country, an abundance of men capable by education, intelligence and probity, of adequately representing their co-workers, and it's about time that these should come or be pushed to the front.

WITH its wonted vim the West is opening war against oleomargarine. Wide-awake Chicago and drowsy St. Louis, and a host of towns between and around them, are insisting that those who use the stuff should know what they swallow. So skilled have the manufacturers of the concoction become that its rivalry is no longer confined to the poorer sorts of genuine butter, but, puffed up by its fraudulent success, it now aims to compete with our choicest grades. The fat factories of Cleveland are turning out every day nearly as much "Western Reserve" butter as the old Reserve itself. From the slumsits use has risen to boarding-houses, thence to small hotels, and it is now making its way, like a "dead-beat" guest, to the tables of our best caravansaries. A prompt exposure of the fraudulent guest for the benefit of mine host! and of the frauduient "butter" for the benefit of his honest guests and the public! Against oleomargarine as oleomargarine, we make no complaint here, but oleomargarine as butter we denounce as a fraud and a pest.

IN planting new orchards, or even single fruit trees, we hope our readers the coming spring will avoid the error of manuring the ground, even though the soil is quite impoverished. The second year, when the trees are well established, they may be manured with advantage. The growth of a newly transplanted tree the first summer is but little and the trees need but little food. To furnish rich food is really to invite disease. A newly transplanted tree may be regarded as an invalid—that is, its growth and vigor have suffered a severe check, and nature at once sets to work to supply all that was lost in the removal, as in the case of an injured person she endeavors to heal the wound. Surely at such times strong food is not to be recommended. The most and best that we can do is to supply mellow earth and to see that the roots and fibers are placed in contact with it, and in case of drought to spread over the earth, a little further than the roots extend, a layer of hay or straw, so that some little moisture may be retained.

"IT is rumored in newspaper circles that negotiations are afoot for the consolidation of the American Cultivator (Boston) and Land and Home with the RURAL NEW-YORKER. 'The survival of the fittest' is the inexorable law as to agricultural journals, however it may have been with our individual ancestors.' So says the New England Homestead. What a strong team that would make! Now will the Homestead please inform us as to the particulars of the combination and the name of the resulting paper?"

We copy the above from a paper recently started in this city, called Land and Home.

During the past eighteen months, it is true, the RURAL NEW-YORKER has received not less than five distinct propositions from certain agricultural journals to the effect that they should be merged into the RURAL NEW-YORKER, we, of course, to control the new combination. Our reply to all has been that our hands, heart and head were all sufficiently engaged fully to satisfy our love of work, our affections and our ambition. We have never, therefore, given the slighest intimation which could have been construed into the rumor to which the New England Homestead alludes. It is but fair to state that we have never received any proposition from the American Cultivator or Land and Home, the former of which we know only as one of our exchanges and the latter only as a fresh, hard-working aspirant for public favor.

WHENEVER any outlay, State or National, is proposed for the benefit of the supreme industry of the country—agriculture—journalists and politicians are ever ready to denounce the project on the ground that other industries receive no Governmental aid, and therefore that agriculture has no right to expect it. But does not every branch of our home manufactures receive a subsidy from the Government to the extent of the import duties levied for its protection upon similar wares made in other countries? Though the farmer suffers from this shutting out of foreign competition on favorable terms with domestic manufactures, by the higher prices he has to pay for his goods, yet he receives no equivalent aid in his own special calling. It is not our object here, however, to discuss "free trade," but to call special attention to what seems to us a flagrant instance of over-protection by which thousands of our friends are injured. The toll for a boat-load of 240 tons of foreign salt over the 345 miles between Troy and Buffalo, is $414, or at the rate of $1.72½ per ton. A boat-load of domestic salt of the same weight over the same distance pays only $82.80, or at the rate of $34½ per ton. In other words, the tolls on foreign salt over the Erie Canal are five times as great as those on domestic salt, on the same weight and for the same distance. The object of this discrimination is to "protect" the Onondaga salt manufacture, and its victims are chiefly the farmers of the West and Northern Middle States who consequently have to pay higher prices for the salt they use in their dairies and for numerous other purposes. It must also be remembered that this extra charge on foreign salt is imposed by New York State in additon to the import duty exacted by the National Government.

ELEVATE THE AGRICULTURAL DEPARTMENT.

A BILL will soon be brought before Congress by the Committee on Agriculture proposing the elevation of the Agricultural Department at Washington to a level with the Departments of Interior, of War, etc., and to place a Secretary at its head, who, like the other heads of Departments, shall have a seat in the Cabinet. A step of great importance is this, and every effort should be made to secure the passage of the bill. This is pre-eminently an agricultural country, and whatever tends to elevate and develop agriculture, tends to elevate and enrich the nation, and from this view the measure should be supported, fostered and cherished by all true patriots. The bill will undoubtedly meet with much opposition. City Representatives and other Congressmen, the majority of whose constituents are engaged in mercantile pursuits, have but little sympathy with affairs directly relating to agriculture. They fail to see how the Government can influence its development, and claim that a Department of Agriculture is of no more importance than would be Departments of mining and engineering, of manufacture, or of any other prominent industry. Let such reflect that one-half the population of the United States live on farms, while the other half subsist by hundreds of distinct occupations. The wealth of the nation lies in her agriculture. If the land and improvements of each of the 4,000,000 farms in the country be valued at $2,500 on the average, the total fixed capital amounts to $10,000,000,000, besides a floating capital of about a quarter of that sum. Viewed in the light of these figures, the importance of agriculture may be more apparent.

Other nations have long found it necessary to have Ministers of Agriculture. Our Canadian cousins furnish us with perhaps the best, certainly the nearest, example of this kind, as their agriculture resembles our own more closely than does that of European countries. If they in their experience find it necessary thus to elevate agriculture, may not we find it equally advantageous?

Efficient as the Department is, its influence for good may be vastly increased. Under its present organization it is merely a Bureau of the Interior Department, and its ability to develop the industry, to promote which was the object of its creation, is limited to the little encouragement that experiments and the distribution of useful seeds and plants may impart. Invested with the dignity and rank proposed by the committe, its influence will be increased in the same ratio. The Secretary will be entitled to a voice and vote in the Cabinet, and in this position will be better able to advocate and execute whatever measures he may find to further the industry. Congress will have a higher respect for the Department, and the farmers throughout the land, feeling that their calling receives just prominence, will gain greater confidence in themselves and their vocation.

BREVITIES.

IT may be well to bear in mind, as to the injury which shrubs and trees may still sustain, that many experienced nurserymen deem February and March the most trying of any season in the year.

FROM Mr. Mechi's (England) balance sheet, it appears that the most profitable item is his culture of peas and the utilization of the leaves and stems, made into hay while green, being in this state far more valuable as fodder than if allowed to ripen.

Mr. J. B. Armstrong, editor of the Daily Republican, of Santa Rosa, Cal., regards the Pacific Rural Press as one of the leading agricultural authorities in this country. We see no reason why the Press should not have a wide circulation in the East as well as in the far West.

Mr. William Hallitt, of Canada, writes us as follows: "I am going to give you some information. In place of hellebore for the currant or gooseberry worm, try plaster-of-Paris. The worm only needs to crawl through it. Recommend it to your readers. If it don't succeed, stop my paper!

SEVERAL subscribers who take the RURAL with the Inter-Ocean have sent us stamps for plants and seeds. We would state that our arrangements with the Inter-Ocean are such that all who forward their subscriptions through that journal are not required to pay postage on our "Free Plant and Seed Distribution."

ATTENTION is called to "Notes from the Rural's Experiment Grounds" on page 134. Instructions — which we cannot repeat at length—are there given relative to the treatment of our seeds and plants. We wish our friends good success with them and hope, when they bloom, that they will forward us specimens of any that are peculiarly striking or pretty.

WE are constantly receiving applications for the seeds of our regular seed distribution of last year. We beg to state that we cannot supply them. Many of them are now sold by seedsmen in general—such, for example, as the Rural Golden Tomato, Rural Bronze Ricinus, Voorhis Watermelon, Blount's corn, Beauty of Hebron potato, etc. We beg further to state that we never *sell seeds or plants* under any circumstances whatever.

MR. Joseph Harris tells us, through his catalogue, of a very original method of testing the purity of an Essex pig. He says: "A large, well filled bed of choice annual flowers is the delight and admiration of all beholders. Even an Essex pig, should he accidentally find his way into the garden, must lack that refinement for which the breed is so preeminently distinguished if he does not, while he is cracking the cherry stones under the trees, stop to admire a beautiful bed of Phlox, Verbenas or Petunias; should he disturb them there would be just grounds for distrusting the purity of his breeding. The roughest man in a village must feel the refining influence of a beautiful flower garden."

THE KIEFFER PEAR.—Mr. William Parry writes us as follows: "I have observed in the RURAL a paragraph, of which I much approve, advising caution to the purchasers of Kieffer Pears. I have myself expressed the same sentiment on other occasions knowing that fruits do not generally succeed equally well in all localities, and when new fruits are introduced, it is prudent to test them gently. Plant half a dozen trees or less, and see how well they are adapted to the soils and climates. Thus experience may be obtained, worth more to the planter than the reports from other sections. I advise parties to try half a dozen first; would much rather they should be thoroughly tested in all parts of the country, than that any one should plant largely of them on the credit of what the original tree has done standing where it grew from seed.

OF the Cuthbert Raspberry, the RURAL NEW-YORKER remarks that "its weak point is not yet discovered." Mr. Roe says he has seen it "killed to the ground."

The above is from the New York Tribune. We cannot suppose that Mr. Roe desires to imply that the Cuthbert is not a very hardy Raspberry—but rather that there is no variety of Red Raspberry that is entirely hardy in this climate. Mr. Roe, in reply to an inquiry of ours, wrote as follows, July 25th of last year:

CORNWALL-ON-HUDSON, Jan. 25, 1880.

EDS. RURAL NEW-YORKER:—I best express my opinion of the Cuthbert by stating that I planted, last spring, five times as many of this variety as of all others together, and that after seeing it in fruit once more, I am so pleased with it that I shall plant few other Raspberries this fall. Such definite, practical action counts for more than a whole dictionary of words. As far as I can now judge, it seems to me the most valuable Raspberry that has been well tested. I have taken pains to observe this Raspberry very closely. It is rather late in maturing, if this is a fault, and it may develop others. I state my opinion only up to the present time. E. P. ROE.

We have tested this Cuthbert at the "Rural Grounds" for two years and have not thus far, known it to be injured in the least by the severities or changes of winter and spring. It will be granted that the RURAL NEW-YORKER has created the present *furore* over this remarkable Raspberry, and we shall feel exceedingly chagrined to find that extended tests do not support the opinions we have so confidently expressed.

For Women.

CONDUCTED BY MISS RAY CLARK.

WHAT AILED THE PUDDING?

BY JOSEPHINE POLLARD.

"WHAT shall we have for dinner to-day?
Said Mrs. Dobbs in her pleasant way:
"For Sally has much to do, and would wish
That we'd get along with an easy dish—
Something that wouldn't take long to prepare,
Or really require much extra care."
Said Mrs. Dobbs: "There isn't a doubt
But what we'd all fancy a stirabout!"

"A hasty pudding! Hurrah! that's nice!"
Exclaimed the girls and boys in a trice.
Then Sally put on the biggest pot,
And soon the water was boiling hot,
And Mrs. Dobbs mixed together some flour
And water, and in less than half an hour
The pudding began to bubble up thick
And dance about with the pudding-stick.

Said Mr. Dobbs, as he made a halt:
"Our Sally is apt to forget the salt;
So I'll put in a pinch ere I leave the house."
And he went on tip-toe, as still as a mouse,
And, dropping a handful in very quick,
Stirred it well about with the pudding-stick,
And said to himself: "Now, isn't this clever?"
At which the pudding laughed louder than ever.

Then Mrs. Dobbs came after a while,
And looked in the pot with a cheery smile,
And thought how much she'd enjoy the treat,
And how much the children would want to eat;
Then said: "Our sally has one great fault—
She's very apt to forget the salt!"
And into the hasty pudding was sent
A handful of this ingredient.

John, George and Jennie, and Bess, in turn,
Gave the stick a twist, lest the pudding burn;
For oh! how empty and wretched they'd feel
If anything ruined the noonday meal!
And each in turn began to reflect,
And make amends for Sally's neglect,
For the girl was good, but she had one fault—
She was very apt to forget the salt!

But Sally herself, it is strange to say,
Was not remiss in her usual way:
But before she went to her up-stairs work
She threw in a handful of salt with a jerk,
And stirred the pudding and stirred the fire,
Which made the bubbles leap higher and higher,
And as soon as the clock struck twelve she took
The great big pot off the great big hook.

It wasn't scorched! Ah! that was nice!
And one little dish would not suffice
Mr. or Mrs. Dobbs, I guess,
John, or George, or Jennie, or Bess;
And as for Sally, I couldn't say
How much of the pudding she'd stow away,
For she was tired and hungry no doubt,
And very fond of this stirabout.

A happier group you'd ne'er be able
To find than sat at the Dobbs's table,
With plates and spoons, and a hungry wish
To eat their fill of the central dish.
But as Dobbs began to taste
The pudding, he dropped his spoon in haste;
And all of the children did likewise,
As big as saucers their staring eyes.

Said Mrs. Dobbs, in a voice not sweet:
"Why, it isn't fit for the pigs to eat!"
And I doubt if an artist would e'er be able
To depict their looks as they left the table.
Said Sally: "I thought it would be so nice!
But I must have salted that pudding twice?"
And none of the family mentioned that they
Had a hand in spoiling the dinner that day.

—*Independent.*

DESCRIPTION OF CUTS.

No. 62:—EVENING-DRESS. The dress is of faded rose-colored muslin, trimmed with insertion, kilted Bretonne lace, and bows of satin ribbon, this is worn over a plain Princess robe of faded rose silk.

No. 63:—Shows a design for neck wear and, also a style of dressing the hair.

No. 64:—Lace Tie. The tie is a combination of lace and mull or other gauzy material.

Nos. 65, 66:—Are designs for crochet or zephyr work.

A DAY AT A QUILTING.

ONE morning Mrs. Raymond called with an invitation for me to a quilting at a neigbor's nearly two miles away. And now I will tell the sisters of the "Rural" about the quilting. It was at the home of our new neighbors, the Neal's, who live in a little log house in the woods, nearly half a mile from any neighbor. Fair sister, used only to a life of affluence, to scenes of grace, and beauty, surrounded by all that a cultured taste can crave, do you turn indifferently from my homely sketch? Would that I could imbue every heart with the glorious, never-dying truth that love may reign as royally and hearts as truly beat within the lowly cottage as in the princely mansion; that the humblest log-cabin of the forest may be hallowed by love as deep and tender as any that ever performed its blessed mission on God's fair earth.

"Grandma Neal" is paying our neighbors her autumnal visit, and not one, from her handsome son down to the wee-toddler, but is remembered in some substantial way—indeed, "Grandma" is the "good fairy of the Neal household;" and though her means are limited, the simple gifts from her humble store bring sincere pleasure to the hearts that love her. "Such apples and pears! such plums and grapes as Grandma brings!" Surely their like was never seen in that little kingdom where she reigns a crowned queen. Love does reach out to clasp its own, the wide world over!

Among the gifts were materials for some bed-quilts, needed for the bitter cold nights of the winter; and wishing to see all completed before her departure, they decided to make "a quilting." One quilt was on the frames when we arrived. We were a company of three, two others having preceded us. We set to work with a right good will: amidst social chat, now and then a burst of song, and many a merry peal of laughter; the work went on, only a pause to obey the call to dinner. This quilt completed, we removed it from the frames, and, after the usual shaking and fun in throwing it over the head of some blushing lass, we hastened to put on another quilt: this was merely covering an old quilt with new calico.

No. 62.

The old lady said, she thought it a good plan, when quilts became worn, to cover them plainly, outside and line with new calico, quilting on the cover (not closely,) instead of tacking; it saves buying new cotton. Of course, the quilts should be perfectly clean before being covered; and after the lining is stretched on the frames and the quilt spread thereon, should there be any much worn places, lay upon them pieces of cotton-batting (this may also be from old quilts,) and then carefully put the cover in place.

I was thereby reminded of Aunt Maria's plan, which is to take new, cheap, unbleached muslin (sheeting,) and color it for covering worn quilts, though her way is to tack the covers on. This is cheaper and more durable than common calico. A very good color for this purpose (as also for cotton stockings, carpet rags, etc.,) may be made as follows:—Make a strong dye by boiling unrossed soft maple bark with water, in an iron kettle; strain through a colander, rinse the kettle and put into it, the clear dye, to every ten or twelve quarts adding a piece of alum nearly as large as a butternut, having first dissolved it in a little hot water; wash the goods in strong soap-suds and put them in; stir often, lifting them into the air occasionally; do not let them be crowded in the dye. This process secures an even color. When of the desired color, hang them in the shade to dry; then wash them in soap-suds and rinse thoroughly. If a different shade be desired, part hemlock bark may be used.

But to return to the quilting. After dinner the talk drifted into other channels, Mrs. Neal, the elder, interesting us with some incidents from her ripe experience, for she is an old lady, with silver, threaded thickly upon her brow, one who has quaffed deeply of life's sorrows and disappointments as well as its joys and sunshine. Some remark touched a tender chord in her memory, and she spoke of the time of the one great affliction of her early womanhood, when the beloved husband was removed from her side by that ineludible messenger—Death. How he was comforted and upheld in a dying hour by a trustful reliance on his Saviour, and with what firm assurance he declared that, though many troubles and dangers might beset, and their feet wander far from the path of right, his children—two little boys scarce more than babies—would eventually become living monuments to Christ. Sublime faith! And its fulfillment, now in their manhood, the aged mother longs and prays (we cannot think in vain) to see.

At supper the canned pears were so nice that I really could not help remarking it.

"The grapes and plums," said she, well pleased, "I canned before I came; the apples and pears I brought with me. You see, Lizzie here has had no experience in canning fruit, and I wanted her to learn." Then she kindly told me her way of canning fruit—a method, she said, by which fruit would keep for years. For the quart cans, about two quarts of fruit is required. To each of these large cans, if of grapes or plums, allow two teacupfuls of sugar, heaping and packed, which she says is a pound. For apples and pears, one teacupful of sugar. Add just a little water to start a steam in canning apples and pears, none for juicy fruit, and cook the fruit with the sugar a few minutes, or until the fruit is done; then take a glass can, wrap it to the very top in a towel wet with cold water, and with the hot fruit immediately fill the can brimming full, and screw the lid down tight. She did not say, but I presume it should be kept in a cool, dark, dry place. I have not tried this way of canning fruit, but certainly it seems a very quick and easy one.

Supper over, we rolled the quilt for the last time, finished marking it, and quilted a short time; then, finding that we could not finish the work—the gathering shadows warning us of approaching night—amidst many thanks for our assistance, we said good-night, and turned our faces homeward.

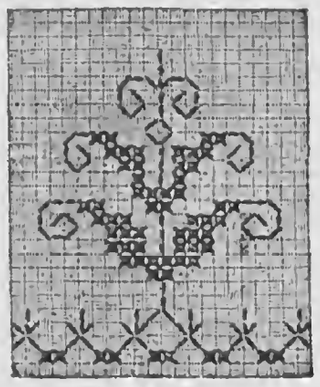
REVIEW OF THE WOMAN'S CLUB.

THE MOTHER-IN-LAW.

I SHALL never fill this position, I therefore rise



No. 65.

to preach a short sermon, from an independent standpoint

You will find my text in Paul's Epistle of the Ephesians, Chap. V. beginning at verse 28th; "So ought men to love their wives as their own bodies. For no man ever yet hated his own flesh, but nourisheth and cherisheth it. For this cause shall a man leave his father and mother, and shall be joined unto his wife, and they two shall be one flesh."

No triune government has ever yet been permanent, save that of the Father, Son and Holy Ghost, and even in this, a sacrifice had to be made to appease the anger of a just God. Therefore, oh! frail man, never attempt to set up a family of three heads, for each will become a Medusa whose very hair has turned to serpents—green-eyed monsters of jealousy. In all such confederations, one must become a mere cipher, and this from natural causes, is likely to be the wife, if her husband remains subservient to "his mother."

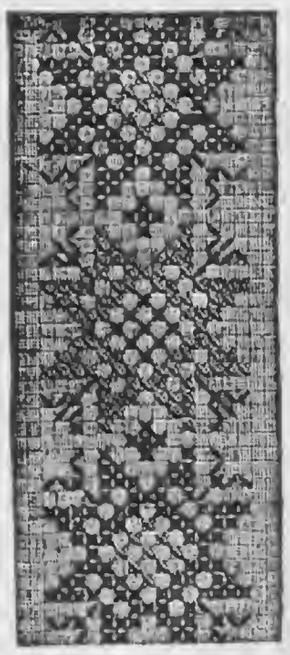
No. 64.

From experience, the mother quite naturally takes precedence in the responsibilities new to the young wife, and by right of this activity, secures the confidence in her superior judgment, and the deference to her will and wishes which she is unwilling to share with that young chit, his wife, who instead of growing self-reliant, becomes daily more dependent, shrinking back within her narrow domains, dissatisfied with herself, and jealous of the precedence of her mother-in-law.

The husband is disappointed in his helpless little wife and begins to regard his mother as a martyr and suggests that she have wifey help under her direction. The wife takes no pride in doing a thing for which, if well done, mother will get the credit, and goes about it with little energy, whereas if she were left to herself encouraged with love and confidence reposed in her, the will would find the way to the accomplishment of difficult tasks. "Experience is the best teacher," and here let the wife take her first lessons. The mother can prove her love, and endear herself not only to the daughter-in-law, but more deeply to that son, through acts of kindness to the daughter, without wrestling the reins of government from the rightful head of this newly established domesticity.

Why should she desire to take upon herself the responsibility of raising another family? She only increases her own cares, and instead of binding, to her, often alienates, by interfering with this twain. If she feel aggrieved, let her remember she has had "her day" in the love of her own husband, the proof of which is this son over whom she is contending with the wife of his bosom.

She belongs to the generation passing away, while there is a prospect for a long life stretching before this couple who must pull together through all its cares. Should the wife then become a cipher in the very outset? The sooner she is fitted for this struggle the better, and every mother will do well to let her son's wife "Paddle her own Canoe" in this voyage of life. Let her take satisfaction in seeing his devotion to that wife who has the brunt to bear, let life go ever so easy with the pair. By her own sufferings, mortifications and disappointments, let her measure



No. 66.

those in store for the young wife, and pity her. She too may have one day become a forgotten mother, or no mother at all (which is worse.) She may never have even the memory of a child-love to cheer her solitude.

MRS. M. L. S.

No. 63.

WINTER GOSSIP.

MRS. E. A. H.

PHILENA called one January morning to borrow a saddle. She had already ridden three miles, on her old, gray nag, with her feet hanging down below the old sheep-skin strapped to his back, the breeze playing about them and her unprotected ankles, as freely as if it had been a warm summer's day instead of the chilly winter's day that it was.

But Philena was not cold; of course not, at least she said so; to have acknowledged that she was would have been as much as to say that she ought to hide those dainty feet in overshoes, a

those slender ankles in leggings, and that would never do—no never.

She put her hand down where the leggings ought to be and gave a sly rub once or twice; that was why I suggested drawing nearer the stove, and that was when I found out that Philena was not cold. Her head was protected by a light, feathery straw-hat, and her ears by flashy jewelry. I saw her give a sly nip at the tip of one, with her thumb and finger as if to pinch back life into the chilled flesh.

To be sure, a gay nubia was thrown carelessly around her shoulders but her ears were not long enough to nestle in its inviting folds, so they had to stand out alone and unpitied, and if they did not literally face the breeze, they had to 'ear it. "Wouldn't you like another wrap? your ride will be a very cold one," I ventured. "O! no, I am not cold at all. I always dress just the same in winter as in summer," she answered with a significant toss of the head. "For pity's sake, child," I said, "don't you wear flannels?" "No, never, they make one look so bungling."

But the horse was at the door, and with a coquettish jerk of the head towards the young man who brought him up, while the tinsel ear ornaments dangled in the breeze, she mounted and was away.

One cold October morning, I sat upon a ferry-boat, crossing the Mississippi, literally buried in wraps. The wind came scurrying down the stream right from the Artic regions. I pulled the robe higher about me, tucked my ears, already covered by a nubia, into the convenient folds of the fur overcoat beside me, and yet thought I should freeze before the uncompromising ferry-boat dragged its slow length across; but there a little to windward of our team was another, and in the buggy sat a lady chatting glibly with a gentleman friend she had discovered; her hat pushed back off her head as if a fungus growth were sprouting from beneath, while a ribbon or two flapped up and down, hither and thither, about the naked ears and neck as their only protection from the blast.

Said a mother to me, "My little girl is getting the rheumatism." Does she wear flannels?" I asked. "Oh, no; she never has," she replied, and when I suggested they might act as a preventative, she replied in a very uncertain tone, "Possibly they might."

I notice in church mothers keep on their cloaks and fathers, if they take off their overcoats, have thick clothes beneath, but the babies are stripped down to their home wear, and with their thin shoes and stockings are allowed to run about the cold floor, where my own well-clothed feet half freeze in sermon time.

Our grandmothers knew nothing of some of our facilities for keeping comfortable, but they wore stout, home-made woolen. In these times there is no excuse for freezing one's blood, only Philena's "It makes one look bungling," to wear clothes for comfort.

THAT GOOD-BYE.

BY MRS. J. E. S.

It is with exceeding regret that the readers of the RURAL learn of Miss Ripley's leaving the department "For Women."

This special part of the paper was just what was needed throughout the whole country in every rural home, and should it cease, or even lessen, it will be a great loss—a loss that cannot well be remedied, and one that the wives, mothers and daughters will feel and mourn for most sincerely.

In looking through the past life of the RURAL, we recall the vacuum felt when Mary Wager said her good-bye (and although her name is seen occasionally, as we trust Faith Ripley's will also be), we know it was a long time before that vacuum was filled. In fact, it was the one just leaving who made us cease our mourning and gave us food such as our hearts longed for.

Farmers' wives and daughters have so much real labor that they require something relaxing brought to them to make their life gleam with sunshine. An intense strain, with no interval of rest, crushes out the strongest life. It is human nature to fret if no change is wrought into the passing days. If nothing specially pleasing or interesting is brought in occasionally, every member of the household feels that something is wanting to make home what it should be, something little now, but which may grow, and in years to come may darken the whole of some-one's life.

MEN go about, see their neighbors, learn what this one is doing and what results follow such and such work. They have their periodicals filled with all kinds of subjects relating to "Farmers and Farming" that are "helps" to enable them to work more intelligently and to better advantage with better results; "helps" to learn what points are most desirable to cultivate, to secure certain qualities; 'helps" to amuse as well as instruct, thus breaking the monotony of a life that otherwise might grow dull and weary and finally ooze into nothingness.

While we see the advantage men derive from such resources we cannot help our cry for equal advantages, especially adapted to women. A part of your paper, Mr. Editor, has been set aside for that purpose. We have tasted its sweetness; profited by its goodness; seen its advantages; and know its value and are not willing to *lose all this* thus obtained.

You cannot afford to do without our good will and we cannot afford to have a whole paper to ourselves. We will be satisfied with a portion of the paper, leaving a large share to our husbands, fathers and sons and another share to "Domestic Economy" (out of which the men ought to give a part of their share for reasons evident), and if Miss Ripley cannot be induced to return, let us have some one else to fill the place. Let us by all means have a department "For Women" *edited by a woman*, and may the dear old RURAL advance without retrograding one single step.

PIANO-FORTE METHOD.

I HAVE waited week after week hoping to see an answer to "Jick's" letter upon music, in the RURAL of November 22nd. As it is a subject which is of great interest to me, I venture to tell you what I know about "Mason's Piano-forte Technics."

A short time before reading that article, while spending a few days with a friend, I noticed the facility and *expression* with which a young girl, a daughter of the family, played scales, arpeggios and pieces of more than moderate difficulty.

I made inquiries in regard to her teacher, and found him to have been formerly a pupil of Dr. Wm. Mason, the author of Piano-forte Technics. His manner of teaching differed from anything I had ever seen, as he used no instruction book only a lesson card, with the scale arpeggio, finger exercise and etude, or piece properly marked.

I found him to be very successful in progressing his scholars rapidly, and his system of teaching was that of "Mason's Piano-forte Technics."

I have since ordered one of the books and although I have not had time to examine it thoroughly, consider it the best and most thorough system of scale, arpeggio, and finger practice I have ever seen.

Great pains are taken to form a good touch, to strengthen the fingers and muscles of the hand, to teach scholars to play with expression and in perfect time, and finally, there is given an admirable way of playing brilliant passages "in velocity."

I hope to hear more upon this subject from lovers of music. Those who have the advantages of city life, cannot begin to imagine how eagerly a few words or hints are received by country people, who rarely hear a good concert, or *any* music, outside the walls of home, and who like myself, earnestly desire improvement. CLAIRE.

AN EXCEPTIONAL LETTER.

I DO not agree with your correspondent's objection to the extract from Professor Smith's article, "The Prospects of a Moral Interregnum." The extract published in the RURAL caused me to get the article and read it very attentively.

While the danger that the Professor suspects may be real, I think I can foresee the benefit to result to Christianity from the infidel teachings of Modern Science.

That it will force upon religionists the gradual elimination of the errors that cause the unreasonable and implacable divisions of Protestantism, and then we will have an exhibit of Christianity in its simplicity, beauty and strength, before which even scoffers will stand abashed.

Therefore I do not think we benefit our children by keeping these questions concealed from them. We should teach them to know that they are to be met and dealt with as living realities. We can assure them that Christianity has already withstood an abuse from its friends under which no human institution could have survived, and we can safely trust it in any attack its enemies can make.

One reflection that consoles me in any impending danger to morality is, that our free land is pre-eminently an agricultural country. My brother farmers do the thinking that gives direction to events and they are independent, conservative and safe. K. J. P.

INFORMATION FOR WOMEN.

EVA EDGARTON.

"In a Horn."

THE articles I am about to describe are pretty and suitable for presents. The charm does not lie *in*, but rather *on* the horn. Procure horns of any size, at tanneries or slaughter houses; boil, to whiten, then scrape, ornament with transfer pictures, edging with gilt or silver paper. Hang in groups for effect, or in a window for some tiny climbing plant. Cheap and very pretty.

Worsted Flowers.

I have learned something new in this line. In making lilies, fuchsias, wild roses or any flower containing pistil and stamen, I found I must manufacture something for the same. So mother and I went to work. Not being successful in finding hog's bristles, we pulled a hemp rope in pieces, cutting the tiny strands the desired length. Melted a little beeswax, dipped the ends of strands in it, then quickly rolled them in flour. Some of them we rolled in colored powder made by crushing bits of water-color paints saved from childhood. They look nearly as nice as any I could buy. If any of the RURAL sisters are at a loss for material, this hint may help them.

To Stiffen Mourning Goods.

Use skimmed milk and water, equal parts; or all skimmed milk and iron on the wrong side.

M. A. H. B.

Please give me the address of Mrs. J. J. Astor or some other person or persons interested in the care of homeless children. I wish to correspond with such parties with a view of obtaining help of that class. S. E. W.

ANS.—By applying to George F. Betts, Secretary; 155 Worth St., New York City, you will obtain the desired information.

Literary Miscellany.

FOUR OLD MAIDS.

W. V. A.

"GIRLS, are you all alone, and is there any danger of our being overheard? for we have business to discuss of a deep and serious nature!"

"Indeed!"

"Utterly impossible in this clan! 'Deep and serious.' Why you really make my head ache!"

"Yes, all alone! not a soul in the house beside ourselves! Come! unburden yourself; I know you are dying to tell us all about it; and as we are quite charitably disposed this afternoon, we will listen to you."

"All right! I'll overlook your extreme pertness this time, my Lady Blanche; but beware of the future! To begin with—and don't you dare to interrupt me until I have finished—"

"Good!"

"Go on! We are resigned to our fate!"

"Tell us some more—anything to keep awake this drowsy day!

"You have often heard me speak of Uncle Tom's lovely little place near M——, and you have heard those Lansing girls talk by the hour of 'Brother Harold's elegant country seat,' where they go every summer and have a gay time. Harold Lansing's place is only a half mile from Uncle Tom's, and they are very sociable and neighborly. Every summer Harold's sisters visit him, and he always has other young company enough to make up four our five couples. Uncle Tom and Aunt Mary are going abroad this summer, and I thought to myself, 'Why can't the "clan" go out there and enjoy themselves while they are gone?" And acting upon the idea I wrote to Uncle Tom, who is just the best and jolliest fellow in the world, and I have his written consent here in my pocket to come out and take possession whenever we like. Uncle Tom lives in L——, and M——. is a small village about thirty miles from there. It will take us a half day to travel there, and if we go before Uncle Tom leaves for Europe, he will join us at L—— and escort us the rest of the way, and see us safely established in our new quarters. Now, young ladies, I shall be pleased to hear your seveval opinions.

"'To be or not to be'—that is the question now open for debate."

The speaker was a girl of medium size, a good figure, and a bright, sparkling brunette. She had a rich, warm complexion; flashing black eyes, and hair of deep intense black. Her cheek bones were a little too prominent, and her nose was rather large, but then her lips were so red, her teeth so white, and her cheeks always wore such a bright, healthy bloom that one never took a second thought of those defects. Her name was Olive Browning; and she was the eldest of Hugh Browning's four daughters. The girls called her "Olive Branch." Her father was wealthy and influential; her mother was something of an invalid, and devoted her time to her two youngest daughters, who were still in the nursery. Olive was nineteen, and her sister Clare was seventeen; and a greater contrast than these two sisters could not readily be found. Clare was the same hight and figure as Olive, but her hair was a rich auburn, and her eyes a rich reddish brown, and she was very fair, with pink cheeks, red lips, and regular features. In manner she was quiet and ladylike, rather retiring, but was quite jealous of her eldest sister. Olive was, by some people, termed "wild," and I suppose she was to a certain degree, for she was full of life and mischief; but she possessed many good qualites, and was a general favorite. There was a general warfare between the two sisters. Clara persisted in holding Olive's language and actions up to the ridicule of their mother who was an exceedingly ladylike person and abhorred the loud hearty laughter and gay witticisms indulged in by her eldest born. The father felt differently, however, and was very proud of Olive and allowed her every indulgence.

The other members of the "clan," as they termed themselves, were two sisters, Blanche and Rose Sheldon and their cousin, Margaret Dean Blanche was tall and well proportioned for her hight, and had bright golden hair, dark brown eyes, a fair complexion and tolerably good features. She was a stylish, vivacious girl, and was in great demand among her companions. Rose was the smallest of the four, and was a brunette, though not of the brilliant style of Olive. She was more sedate and had little gentle ways of her own that made her very lovable. Her features were good and well-defined, and her hair was a dusky brown, but readily passed for black. Her skin was of a rich, creamy color, and the "clan" called her the "Yellow Rose." Blanche was twenty-two and Rose eighteen. Their father was in easy, comfortable circumstances, and quite proud of his two daughters, though he had several younger children.

Margaret Dean, the cousin, was an orphan possessed of a handsome fortune of her own. Her parents having died when she was quite young, and Mr. Sheldon, her uncle, being her legal guardian, her home had always been in his house. She had a married brother, who was many years her senior and who would gladly have had her make her home with him; but she preferred to stay with her uncle, who seemed like her own father. She was about Olive's hight, but was slimmer, though a well-formed girl. She had a clear, pale complexion, blue-black hair, dark bluish gray eyes, that had a peculiar way of darkening with any deep emotion, though at times one would pronounce them a decided blue. Her general expression was calm and quiet, and one to look at the quiet, refined face, would never suspect her of the wild pranks she was guilty of. She and Blanche were of the same age, and the four girls were inseparable, so much so, that their acquaintances called them "the clan." None of them were strikingly beautiful, but they were all bright, healthy, mischievous, good-natured girls.

When Olive had finished her communication, Blanche stretched out her arms and exclaimed, "All honor to our chief!" while Margaret or "Margie," as she was generally called, rose, and placing both hands on Olive's head, exclaimed, with upturned eyes, "Bless thee, my daughter, bless thee!"

"O, girls! do stop your chaff, and talk sensibly for a few minutes, if it is possible. Can you go?"

"Of course we can!" said Blanche in her quick, decided way; and she generally spoke for the rest of the "clan."

"But do you think mamma will let us go, Blanche?" asked Rose.

"Never you mind Aunt Nellie," said Margie, "I'll settle all of her objections!"

"Now for proposition number two," said Olive. "Let us all masquerade for the occasion, it would be such fun! Just think! Rob Lansing, Lance Stedman and his sister, his royal highness, Hugh Enders, and that conceited simpleton, Edgar Farras, are part of the number who are going to Harold Lansing's in about two weeks, and it would be the best joke of the season if the "clan" could fool those Lansing girls. They think they are so exceedingly 'cute' to get four of the most eligible masculines in our set all to themselves for a couple of months."

"Good! good!" cried the girls in chorus when Olive had finished.

"What shall we represent," asked Rose, "witches or fairies?"

"Neither!" said Margie. "Let us be four old maids!"

"That's it!" said Blanche. "We will all have weak eyes and wear goggles to conceal our brilliant orbs!"

"And I will be the youngest sister who affects youthfulness," said Olive.

"I'll be the deaf one," said Margie, "and make everyone repeat his remarks, and imagine him to have said just the opposite of what he really did say."

"O, won't it be fun!" said Rose, clapping her hands. "I'll be the eldest sister and something of an invalid."

"O' dear! You three have monopolized all the characters. Pray, what shall I be?" said Blanche, laughingly. "But stop!" I have it! I will be the strong-minded one. How will that do?"

"O, splendid!" cried the girls in chorus.

"Now comes the usual feminine query," said Olive, "What shall we wear?"

But we will not listen to the many details of the dress and other questions but will wait until a week later when four ladies, well disguised by veils and and linen ulsters, leave the city of C—— on an early train. They are very quiet for the "clan;" in fact they are quite sedate. At L—— they are joined by Uncle Tom, a portly, well-to-do looking gentleman of some fifty odd years.

"Well, young ladies, how are you?" said he, in a brisk, cheery manner. "I don't know which of you is my niece, but I will shake hands with all of you." Which he proceeded to do and thereby found out which was his niece, for she held on his hand and drew down his face and, raising her veil printed a sounding kiss on his lips.

"You blessed old darling of an Uncle!" she whispered. "We won't talk to you now, but we will make up for it when we get to M——."

Arriving there several hours later, they entered the handsome carriage that was waiting for them and were soon driven to "The Retreat," Mr Browning's beautiful summer home.

"Now, Uncle Tom," said Olive, after she had introduced her companions, "call Rachel and Jerry, and let them into the secret and make them "swear eternal secrecy."

Rachel and Jerry, a faithful and elderly couple who had served many years under Mr. Browning, were called, and after Olive had shaken hands with them and they had expressed their pleasure at seeing her, Mr. Browning said:

"Rachel and Jerry, this madcap niece of mine, and her three friends, will spend several months with you, and I put them into your keeping and trust that you will be as faithful in this matter as in other things. They do not wish to be recognized, and for that reason each one of them has chosen a character and will act a part. Now I want you both to promise me that you will keep well the secret of their identity and, if questioned, be very careful how you answer. Will you promise me?"

"Certainly, sir," was their answer, and after a few instructions they were dismissed.

"Now, girls, go up stairs and dress. I would like to see the 'four old maids' before I go, which I must do within an hour."

In a short time, four odd-looking ladies entered the room, led by Blanche Sheldon, who wore an extremely short skirt, very plain and scant, a vest and sacque similar to a gentleman's vest and coat and a high, straight collar and plain cravat. A pair of thick soled shoes were on her feet, and a wig of short, thick, black hair covered her golden locks, and altogether she looked strong-minded and masculine.

Rose wore a heavy black silk dress made with a loose sacque that quite concealed her figure. Gray "puffs" concealed her front hair, and the back of her head was covered with an elaborate cap of black silk and lace and a collar of rich lace encircled her neck. She made a nice looking old lady, and her dress, though old-fashioned, was rich in all its details, and her quiet, gentle ways were well suited to the character she had assumed.

Margie wore a dress of gray silk that had evidently been fashioned after a pattern that had been in vogue many years previous. On her head she wore a front of iron gray hair that was slightly waved and combed down quite low on her forehead and temples, and the back of her head was entirely covered with a cap that was twin to the one Rose wore.—[To be continued.

THE EYE-OPENER.

THE Post Office Department at Washington issued an order on the 18th, to Postmasters prohibiting the delivery of registered letters and money orders to the following named persons represented as being engaged in conducting fraudulent schemes: R. C. Wintersmith, 3 Mozart Building Louisville, Ky., supervisor of the Frankfort School Fund Lottery; W. Scott Glore, Louisville, Ky, new agent for the Commonwealth Distribution Co.; M. V. Wagner, Marshall, Mich., who advertises to send patent recipes; Bermo & Bro., New Orleans, La., representing the Royal Havana Lottery Co.; and D. P. Herrick, 43 New street, New York, who solicits money to invest in railroad and other

stocks. On the 19th Smalley & Gale, No. 23 Broadway, N. Y., were added to the above crowd of tricksters on the ground that they are engaged in fraudulent operations. It has been ordered that all persons receiving mail matter under fictitious names shall be identified at the P. O. before the mail is delivered. . . Three or four weeks ago the Robbin's Washer sold by the Bissel Co. was described as a humbug in a prominent Western paper, and the fact was stated here in our issue of Jan. 31. The Bissel Co. protested against the correctness of the description, and invited us to examine the washer. We've done so, and find the charge not proved. . . The "North American Lightning Rod Company" seems to deserve an advertisement here. Its *modus operandi* is stated by a contributor to a Cincinnati paper to be as follows:—As strangers they profess to wish to do a model job for a mere trifle, say, $3 to $6. For example, a house 24 feet high would require two rods, making 48 feet with three points. The usual price of the rod is 67 1-2 cents per foot, which would make a total of $32.40 for the job. It is to be completed however, for $3. The agent produces a printed contract (that few men other than lawyers would understand) and writes on the margin a credit of $29.40, and the paper is then signed by the farmer. When the house is rodded it contains 125 feet instead of 48 feet as contracted for, and as the farmer understood it. The cost then is:—three points, $10.50; one ball, $2.50; 125 feet of rods, $84.37 1-2. Total, $97.37 1-2, minus $29.40. Balance, $67.97 1-2, which the farmer has to pay. One of the writer's neighbors had to pay $128 for what he contracted to pay, as he understood it, $6.

RECENT LITERATURE.

The Workshop Companion: A Collection of useful and Reliable Recipes, Rules, Processes, Methods, Wrinkles and Practical Hints for the Household and Shop. Price, 35 cents. New York: The Industrial Publication Company.

There is probably not a single reader of this notice that has not at some time or other felt the want of some item of information contained in this book, and would gladly have given the price of the volume for one of the recipes. The book covers a very wide range of subjects, there being no less than 90 main articles, some of which contain as many as 60 sub-headings. The pages are of good size and closely printed in very clear type, so that 164 of them contain an unusual amount of matter. The subjects are arranged alphabetically the work thus forming an almost complete encyclopedia of practical, everyday information.

NEW PUBLICATIONS.

The Vagabonds, By J. T. Trowbridge with illustrations by F. C. C. Darley, Boston; Lee and Shepard, New York. C. T. Dillingham. Price $1.50.

The Breaking Waves Dashed High, By Felicia Hemans. Illustrated by Miss L. B. Humphrey, Boston. Lee and Shepard. Price $1.50.

MAGAZINES FOR FEBRUARY.

With the January number, The National Quarterly Review enters upon a new career of prosperity and vigor. It is permanently enlarged by thirty-two pages and hereafter the names of the contributors will be given in each number. The engagements of the Review for the present year include contributors from many of the most eminent leaders in thought and politics, both of this country and Europe.

The National Quarterly Review for January, presents the following list of essays and authors: Rise and Fall of the Bonapartes, by William Dowe; The Management of the Indians, by Rev. W. E. Copeland; English Classics, by May F. Miller; The Hygiene of Water, by David A. Gorton, M. D., the editor; The Working-Classes of Europe, by David Ker; The Nebular Hypothesis, by David Trowbridge, A. M.; Interstate Extradition, by J. Manford Kerr; The New Eastern Question, by David Ker; A Southerner's Estimate of the Life and Character of Stephen A. Douglas, by Hon. James D. Waddell; and a very full department of Reviews and Criticisms.

Phrenological Journal.—Contents.—Rev. Elijah D. Murphy, Pastor of the New York Port Society. With portrait; Entheasm; Studies in Comparative Phrenology, Continued; Sayings, and who First Said Them; William M. Lowe, Senator from Alabama. Portrait; Agreeableness; Ancient Populations of North America; An Old Custom which ought to be Revived; The Young Folks of Cherry Avenue; Remarks on House Drains, and a Plan for Ventilating Them; Chill-and-Fever South, with Criticism; Clean Beds; Notes in Science and Agriculture; Answers to Correspondents.

Ancient Populations of North America.—From an essay read before the State Archæological Association of Ohio, by Rev. Stephen D. Peet, we make the following eloquent and instructive extract:

"It is proper to observe that there are traces of a numerous prehistoric population scattered over nearly every part of the broad continent. No one who has not made a point of observing, would understand how numerous these vestiges are, or understand their design or purpose; yet they are here to present their evidence, to invite our study and we ourselves are at fault if by comparing and analyzing and attending to their testimony we do not understand the tale.

"Let any one go forth into the fields and the meadows, into the hills and valleys, and search for these records of the past, and he can not fail to trace out an alphabet, more striking than the hieroglyphics of Egypt, or the inscription upon the buried palaces of the East. These works are replete with a varied story; everywhere the decaying skeletons and the silent skull remind us mournfully of the death that has swept over the land; but the remains of fires, the debris of camps, as well as the running stream and sparkling spring from which they drank, all remind us how recently the living have passed away.

'As we go through the silent earthworks, and see all the preparations they made, the walls and ditches for defense, the inclosures they erected for worship, and the monuments or mounds they erected for tombs, we are astonished at the great variety and the wonderful significance.

"If there are modes of life which we do not understand, and structures which are still mysterious in their design, yet they are very expressive of the strange, unknown life of the mysterious religion, the wild aboriginal state. It may not compare with our later civilized condition and modern ideas, for they are only expressive of another condition than that to which we are accustomed.

"But the picture of the prehistoric condition can not be excelled.

"Let any one visit one of the renowned defenses situated so beautifully on the lofty hill-top, and commanding the distant view of stream and valley, of hill and forest, and then look about him and behold the wonderful adaptation for defense and protection, and he will appreciate what were the dangers from the secret foe, and how the war-whoop must have startled the peaceful inmates.

"Let him visit again the quiet village inclosure, and see the surrounding wall, and trace the palisades, or tread the path to the unfailing stream, and walk over the happy hunting-ground and the delightful valleys, and he has a picture of peace which nothing else can give.

"Let him then enter the corn-fields or the garden-beds, or surmount the elevated platform, or enter the ancient courts and court-yards of the agricultural people, and he again has a view of another state of life which he did not know. Again, let him enter one of the sacred inclosures and look about him and see the altars and the temple platforms, and all the complicated structures, wherever the social fires were lit and the victims of a sacrifice were offered, and even if he knows not the worship that then prevailed, it is not difficult to imagine something of the religious customs of the people.

"The grand pageant of the assembled multitudes passes before him as they gather at their religious ceremonies, or their great burials, or for their war expeditions. In imagination he sees in one place the merry-making and the dance, he hears the music and the laughter; but at another he looks upon the smoke and the slaughter and the many mysterious rites. Here he beholds the 'very great burning,' the solemn mourning, the sacred burial; there he sees the plumed warriors, armed with their stone axes and flint spears and maces, either in fleets of canoes, navigating the waters, or in long lines traversing the forests. Everywhere the scene is suggestive of a life that has passed away. Whether one stands on the lofty pyramids of Mexico, which once reeked with the gore of human victims taken in battle and slaughtered as sacrifice, or among the extensive dwellings of the Pueblos' where such multitudes gathered for defense or for residence, or among the sacred inclosures of the Mound Builders, where a still stranger people once lived and toiled and worshipped—yet each structure is suggestive of a life which once prevailed, but which has passed away, and of the prehistoric condition of this continent.—*Phrenological Journal for Feb.*

The American Almanac and Treasury of Facts, 1880. Statistical, Financial, and Political; Edited by A. R. Spofford, Librarian of Congress: Published by American News Company. Price, 25c. The title aptly indicates its contents, being a "treasury of facts," and its author should be the necessary criterion of reliability. Twenty-five cents would be profitably spent in its purchase.

Scribner's Monthly; St. Nicholas; Demarest's Monthly; Domestic Monthly; Delineator, E. Butterick and Co. The above have been received, but further notice is unavoidably crowded out.

The American Antiquarian also received,

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN-THOUGHTS FROM EVERY-DAY HOUSE.

MRS. ANNIE L. JACK.

"There now!" I said. "Why not practice what we preach?" The family gave a questioning look all round. It was only papa's boots that had been wet through by accident, and now when dry, were found too tight for his feet. "I *knew* better," said I. "They ought to have been filled with dry oats, which grain is fond of dampness and would have absorbed it, and formed a sort of "last," keeping the boots in good shape, and drying without hardening. But, then, one cannot think of everything."

I have found a very good way to take out indelible ink, which is to cover the spots with strong salt-and-water. After soaking a few hours wring out, lay on a shallow plate and cover with ammonia. In this way I obliterated some names from table linen, when the markings of a family name needed the change. I do not say it will apply to all kinds of marking ink, but in my case it proved successful.

We were making cake the other day and our pound weight was missing so I hunted out an old book in which in the early years of my housekeeping, I had jotted down useful notes, and found this list, that may be of value to some who have no scales and cannot always guess: 10 eggs weigh a pound; a quart of powdered sugar is equal to a pound and seven ounces; a quart of granulated sugar is equal to a pound and nine ounces; a pint of closely packed butter equals a pound; as does a quart of sifted flour. Butter the size of an ordinary hen's egg, is about two ounces. These seem "trifles light as air" but they help to make up items of domestic economy.

AT THE DOOR.

M. G. RAND.

Some visitors, when about to leave a house, are so thoughtless as to stop to talk, unnecessarily, with the hostess at the outside door.

Hall's Journal of Health calls such a habit "hanging to the door-handle," which is certainly a very comprehensive way of expressing it.

When a lady is so polite as to accompany a friend to the hall-door, it is in bad taste for the visitor to linger, particularly in winter.

The lady of the house may have been sitting in a comfortably-heated room, or perhaps she is warm from working in the kitchen. Not expecting to be kept in the cold, she does not put on extra wraps when she goes out with her caller to the door. The latter, in her heavy cloak and furs, does not mind the cold—it is rather agreeable to her than otherwise. The hostess is the one who suffers from the sudden change from a warm room to a cold atmosphere. The shock often leaves her with a cough, chills, or neuralgia. These evils are not imaginary, but hard facts, as many a victim of *door-handle* talk could testify. A lady who is liable to have calls from persons who are so forgetful of the comfort of others, would do well to remind her friends of the danger of being kept *shivering* at the door.

Surely no one would give offense for so reasonable a suggestion, unless it be the minister's wife, who, for some unaccountable reason, is expected, as a rule, to endure all things. Perhaps the best way for *her* would be to keep a shawl near the door, and make use of it should she have occasion.

There is another thing of common occurrence that ought to be changed. It is the habit that some people have of asking to see a friend at the door, for "*just a minute.*" If the call should not extend beyond the specified time, it might be well enough, in most instances. Generally, the call of a minute is lengthened to one of five, ten or twenty minutes. When a lady receives such a peremptory summons to the door, she answers it as quickly as possible, naturally thinking that her friend is "in a hurry." She fails to discover any reason for undue haste, and secretly wishes she had waited to finish her half-made cake, or the garment that lacked but five stitches of being done. It may be that she is tired, and would like to rest in an easy chair while talking, as she could, if the caller *would* only come into the house. "She don't want to go, and she don't want to stay," as Josiah Allen's wife said of the "Widow Doodle," so what can the hostess do?

These things happen every day, and will continue to, until ladies reflect a little upon the evil of what at first seems of little consequence. Visitors should finish talking while indoors, and when they make a move to leave, they should *go* without delay.

Clinton Co., Iowa.

WASHING BLACK CALICO. GINGER CAKE. DOUGHNUT POTATOES.

If H. M. S. will starch her mourning or any dark calico in skimmed milk and iron on the wrong side, she will find it almost equal to new. Should there be an aroma of scorched milk about it when ironed, thorough airing will entirely dispel it. Calicos soaked for half an hour in cold salt water before washing, are less liable to fade. I called on a neighbor last week, who is a practical housekeeper. While there she treated me to a generous piece of hot ginger cake, which was so nice that I asked for the recipe, which she gave me. It is as follows: One and one-half cup sorghum molasses; one cup sour milk, one-half cup lard, or frying; one egg; two teaspoonsful ginger; two even teaspoonsful soda; a little salt and flour to make a batter not too stiff.

For a change we have, occasionally, what we call "Doughnut Potatoes." Peel them, leaving the small ones whole and cutting the larger ones lenghthwise so that they will be all about the same thickness. Wash sufficiently, wipe dry and fry in hot fat as you do doughnuts. I allow fifteen minutes for cooking. When done a nice brown take out and over each layer sprinkle a little salt. Serve hot.

I heartily agree with the decision of the Kitchen Club in regard to dressing girls. I have three to dress, aged 11, eight and six years, and I am particular that their lower limbs shall be protected from the cold. I wish to have them grow up strong and healthy and think this one of the first requisites.

Mrs. E. R. F.

DOMESTIC RECIPES.

Graham Gems.

One pint of sour milk; one egg; one spoonful of sugar, and one spoonful of soda. Graham flour to make a stiff batter. To be baked in iron gem-pans with a quick, hot fire.

Soft Molasses Cake.

One cup of sugar; one cup of molasses; three cups of flour; one-half cup of butter; one-half cup of buttermilk; two eggs; one teaspoonful of soda; a pinch of salt; half a teaspoonful each of cloves, cinnamon and ginger. Bake very slowly.

Baking Powder Cake.

One cup of sugar; two eggs; one-third cup butter; one-half cup milk or water; one cup of flour; two and a half teaspoonsful of baking powder.

Hickory-Nut Cake.

Two cups sugar; three-fourths of a cup butter; whites of six eggs; three-fourths of a cup sweet milk; three teaspoonsful of baking powder; one pint rolled hickory-nut meats.

Jelly Cake.

One cup sugar; two eggs; one-half cup of milk; four tablespoons butter; two teaspoons baking powder; one and a half cup flour.

Hamlets.

Two eggs; one and a half cup of sugar; one cup of raisins chopped fine, two-thirds of a cup of butter; one teaspoon each of cloves, cinnamon and nutmeg; one teaspoon soda dissolved in two tablespoonsful of sour milk. Mix stiff and cut out like cookies.

Tapioca Pudding.

Four tablespoons of tapioca, soaked for several hours in a little water; one quart of milk; four eggs (leaving out the whites of two for frosting); three tablespoons of sugar. Boil the milk and turn over the tapioca; add when it is blood warm, the sugar and eggs well beaten; bake about an hour and after it has cooled a little add the whites of the eggs, well beaten with half a pound of sugar.

Mrs. T. S. Aldrich.

Railroad Cake.

One teacup of sugar; three eggs; two tablespoonsful of new milk; one teacupful of flour; one teaspoonful of cream-of-tartar and one-half teaspoonful of soda. Bake 10 minutes.

Soda Biscuit.

One quart of flour; one teaspoonful of soda; two teaspoonsful cream-of-tartar; a little salt, and new milk enough to mix soft. Dissolve the soda in the milk and mix the cream-of-tartar in the flour.

Clarissa K.

Hard Soap.

I would like to send a recipe for hard soap, which I found in your paper several years ago and have used it for three years.

One pound of concentrated lye dissolved in two quarts of soft water; pour into a large pitcher to cool. Melt five pounds grease of any kind, have it milk-warm and pour in the lye slowly, stirring rapidly until it begins to thicken. Add one or one-half ounce oil of sassafras. Pour into a box one foot square and cover it, leaving it in a warm place for three or four days. Cut into squares and it is ready for use. Try it.

Mrs. W. W. Hunt.

Bread and Butter Custard Pudding.

Three pints of rich milk; eight eggs; one good sized loaf of baker's bread; one cup of sugar; one cup of molasses; one cup of stoned raisins; one teaspoonful of ground cloves; one teaspoonful of ground cinnamon and a teaspoonful of salt. Cut the bread into rather thin slices and butter thickly. Butter a deep, earthen, pudding dish; put in a layer of bread, neatly fitting it to fill the bottom of the pan. Scatter a few raisins over, then put in alternate layers of bread and raisins until all are in. Bring the milk to a boil; add the sugar, molasses and salt; then turn gradually on to the beaten eggs and spice. Pour the custard over the sliced bread until covered; let soak in; then add more—stirring the custard that the spices may not settle. Do this until all is in. Cover with a plate a little smaller than the dish, press down and let stand an hour before putting in the oven. Bake covered, very slowly, one hour. Remove the cover at the last to let the top brown. Eat with a hard sauce.

Mary B.

QUESTIONS ANSWERED.

Buffalo Robes and Furs Infested with Moths.

Please inform me how to destroy moths in buffalo robes and in any kind of furs?

A Subscriber.

Ans.—They may be subjected to a heat sufficiently strong to kill the larvæ without materially injuring the fur; or, sprinkle liberally with rectified spirits of benzine and roll up tightly for a day or so. It may be that exposing them to the fumes of sulphur may have the desired effect. We merely offer this suggestion.

Furniture Polish—A Correction.

Mrs. M. J. Galpin desires to change her recipe for polishing furniture as published in Rural of Feb. 7, as follows: The proportions are one ounce spirits of turpentine to two of raw linseed oil.

News of the Week.

MISCELLANEOUS.

Monday, February 23, 1880.

A Washington dispatch says of the White House reception, Tuesday night: No wine was served with the collation. The wife of a foreign minister was heard to remark at the table: "What an air of purity it gives to Mr. Hayes's parties, this absence of all that can intoxicate."....Mrs. Conkling is said to be really heart-broken because her husband will not be reconciled to their only daughter, who had the audacity to marry an excellent but poor man because she loved him ....Southern States are trying to keep emigration agents from enticing their colored help away by requiring such agents to pay a big license fee. Georgia has recently enforced such a law on its statute books, and Mississippi and Louisiana are proposing to copy it. Louisiana will make the fee $500 for every parish visited..... .Bismarck has bought 40,000 seedling American maples to plant in his forests in the Sachzeswald.....The German republicans of New York state are preparing to hold an anti-third term convention at Syracuse on the 24th.... ....It is a general principle of law, with which a number of decisions have made the public familiar, that a passenger has a right to a seat on a railroad car before paying his fare, but an Illinois court has recently ruled that when an "excessive number" of passengers apply for seats, the company cannot be required to provide seats and is not liable for any injury which may be incurred by passengers while riding in the aisles or on the platforms.... ....Fires have burned the State normal school at San Jose, Cal., loss over $250,000, insurance $50,000; the Lehman cotton factory, near Prattville, Ala., loss $100,000; the Albany (N. Y.) city hall building, loss $50,000, and one man killed; the Theater Royal at Dublin, the manager, property man and four assistants perishing in the flames, loss on the property $200,000.....Both the applications for patents and the patents granted were less in 1879 than in 1878, and in 1878 than in 1877. Up to 1874 both applications and grants steadily increased from 1861.... ...

THE Republican State convention of Michigan will be held at Detroit, May 12th, for the election of delegates to the national convention.....A boiler in Babcock & Barton's distillery, Peoria, Ill, blew up on the evening of the 18th, killing Benjamin Babcock, one of the proprietors, James Richardson, helper; John H. Sill, fireman, and an unknown man, probably a tramp. Oscar Mills, Louis Langdenburg and Michael Burns, employes, are probably fatally scalded.....Circulars were issued on the 19th, by the Philadelphia and Reading Coal and Iron Company increasing the price of lump and steamboat coal on board vessels at Elizabeth, N. J., to $4 75 from $4, as announced on the 16th inst., and to $4 25 from $3 75 for Port Richmond.....A woolen mill belonging to Verlender Brothers, Chester, Pa., burned on the 19th; loss $75,000. A spoon factory in Waterbury, Conn. burned same day, loss $150,000.

THE CONNECTICUT MUTUAL.—Close following upon the correspondence between Colonel Greene, president of the Connecticut Mutual, and the Hon. John W. Stedman, commissioner of Connecticut, the stalwart company prints its annual statement. A careful perusal of it by the policy-holders and the public will show the gain in net assets, in interest received and in amount of surplus. It will also show the decrease in amount of interest due and accrued, and in the expense account. As usual with this company's report, against the item of net premiums in course of collection is written the word *none*. The ratio of expense of management to receipts is $6 54, the smallest percentage shown by any corporation. The market value of stocks and bonds shows steady gain. The critics will, if they choose, comment, as has been their custom, upon the increase of real-estate ownership, and the company will point to its ability to hold it all, and its determination to sell only when the entire amount of cost is realized. The statement is before all who are interested, and all who hope to be. It will meet with heartiest welcome by sensible men.—*Boston Daily Advertiser.*

AGRICULTURAL NEWS.

THE Cincinnati Millers' Exhibition has been deferred from May 3d to June 26th, owing to the large amount of machinery expected.....Jim Keene, the grain speculator, is said to have lost two and a half millions by the late drop in grain—Such reports are very likely to be foundationless; and then how much did he make by the previous rise?....In 1869 Great Britain imported 400,000,000 lbs. of wool and exported 259,000,000 leaving 144,000,000 lbs. which added to the home production of 155,000,000 made a net supply of 396,000,000 pounds. Included in the imports are 4,250,000 pounds of Alpaca and 9,750,000 pounds of Mohair, besides 75,000,000 pounds of woolen rags intended to be torn up and used again. This is familiarly known as shoddy, and the trade in it has increased from 5,250,000 pounds in 1855 to the above large amount. ... .The three great glucose factories are in New York, Buffalo, and Chicago, but there are a host of smaller ones scattered all over the country, and the trade is rapidly increasing.....The "put" and "call" and "straddle," grain gamblers and swindlers of Chicago seem to be doing a "booming" business, much to the sorrow of their dupes .....S. C., has 17 cotton factories in full operation, besides a Clement attachment one at Westminister, all run mostly by water power in the upper part of the State .....There has been such a demand for flowers at New York this winter that fine Gen. Jacqueminot roses have sold for 50 cents apiece by the hundred; while primroses, pansies and the commoner kinds of flowers have been called for so fast that the florists enter Lent with their conservatories cleared out.....J. J. Mechi, the well known English farmer, keeps 300 head of poultry and finds them profitable Last year New Jersey spent $23,431.81 in enforcing the laws for the suppression of pleuro-pneumonia. Of this vetinary surgeons received $14,924 and other sources of expense gobbled up the balance; $954 were paid for the 80 head of affected cattle killed..... French farmers are now said to be in arms against importations of American cattle, 6,000 of which are reported to have been sold in the markets of that country in the last six months.....Oliver Dalrympe the great Minn., farmer intends to have, next harvest, a wheat patch of 30,000 acres, 20 steam thrashers, 135 reapers and 700 workmen.....Of cattle of all sorts 1,862,265 were assessed in Ill last year 22 per cent. of which were marketed—the average gross weight was 1,163 pounds; average price per 100 pounds $3.50; aggregate value $16,751,450..... That Australian meat sold in London, mutton at 11 and 12c. per pound and beef at 10c.—a trifle higher than American meat, due most likely to the novelty in part.....Upwards of 10,000 sheep were imported into Neb. in '79—How many exported?. ..... The exports of butter from this country are only four per cent of the production; those of cheese forty-one per cent. English people eat far more cheese than butter....The total value of the exports of provisions and tallow from the United States in January last was $9,498,957, against $10,436,359 in January 1879,...The merchant steel manufacturers of the U. S. convened here on the 17th and decided to advance prices only a little—afraid of foreign competition ....The English government will donate seed potatoes and grain to the famine-stricken Irish peasantry, but refuse to supply fertilizers....The steamer Canopus from Boston to Liverpool, arriving on the 17th, lost 247 head of cattle from rough weather.....Large supplies of Australian wheat are said to be *en route* for England via the Suez canal. ....An Indianapolis pork-packer is said to have invented a machine that will scrape 7,000 hogs a day....While railroads charge 40c per 100 pounds of grain from Chicago to this city vessels are taking it hence to Liverpool for twelve cents..... Waterville, N. Y., raised last year 1,163 acres of hops, yielding 4,800 bales, averaging 175 pounds each; only 13 farms in the town didn't raise any. Some raise 60 to 70 acres. One man raised 76,500 lbs. on 60 acres....About Sweetwater, Tenn., the army worm is reported to be playing havoc with growing wheat.....La. sugar costs $40 per hogshead; from 1 1-2 to 2 hogsheads can be got from an acre and sold for from $120 to $160.... ...The silk crop of 1879, as compared with that of the previous year, is thus estimated by the Lyons Society of silk merchants:

		1878. Kilogrammes.	1879. Kilogrammes.
France		7,718,200	3,200,000
Italy		29,751,003	17,421,000
Spain		830,000	500,000
The Levant	Brousa	1,125,000	600,000
	Salonichi	850,000	850,000
	Syria		2,382,797

.....A kilogramm is somewhat over 2 1-2 pounds. Now set that smart son of yours to work, or better still, that cute daughter,.....Statistics just published in Prussia show that the number of pigs infested with trichinosis in 1877 was 162,000 against 172,000 the year before.....A large batch of new Italian Senators has just been created to overcome a majority in the Senate opposed to the repeal of the odious grist tax imposed in the financial stress of some years since and bitterly denounced ever since by the people. Free milling henceforth.....The emancipated serfs of Russia are giving a world of trouble here and there from a forty-acre-and-a-mule sort of belief of what the government has done for them. They are seizing estates and dividing the property of the wealthy among themselves.....A Congressional Committee recently reported that all the public lands in Nebraska west of the 100th parallel should be withdrawn from sale and pre-emption and leased for grazing purposes, on the plea that 1,000,000 acres thus cut off is not fit for farming—just indignation among Nebraskans who have often proved the fallacy of such assertions with regard to other parts of their State .....The Pennsylvania Board of Agriculture at its late meeting passed a resolution that it is high time that the fence laws of that State, made to suit the circumstances of nearly half a century ago, should be made to conform to the altered conditions of today.....Shipments of cattle are much heavier now than at this time ever before.....The value of our fruit crop is put down by the Government statistician at $140,000,000, nearly half of the value of our wheat crop .....In 10 years only 38 cheese factories, we are told, have been started here, while 83 have been founded in Russia in the same time. ....New England has 230 farmers' clubs, with 27,000 active members.....Last year's cotton crop was the largest ever raised....It is officially stated that 106,000 persons are in absolute destitution in Silesia, Prussia. Government aid is necessary, not only to feed the people, but to furnish them with seeds for next crop and to supply fodder for 20,000 cattle "that they lose not all their beasts."....There is a very severe famine in Turkistan, owing to the whole or partial failure of three harvests in succession....The maple sugar season is unusually early this year....Hudson River farmers, milkmen and fruit-growers are thinking of starting a line of steamers of their own to this city to lessen the outrageous charges on their goods... Palatine Bridge, Montgomery Co., N. Y., is to have a new cheese factory....It is said that two-thirds of the Michigan wheat crop are still in that State.

Americans Traveling Abroad

will find all of Dr. Pierce's Family Medicines on sale in all principal drug stores and at the London branch of the World's Dispensary, Great Russell Street Buildings. Golden Medical Discovery is a most potent alterative or blood-cleansing elixir. It dispels all humors and cures blotches, pimples, eruptions, king's evils, or scrofula, enlarged glands, swellings, internal soreness, ulcers, and virulent blood poisons that, unremoved, rot out the vital machinery. Dr. Pierce's Pellets (little sugar-coated pills) are an agreeable and most cleansing cathartic; remove offensive and acrid accumulations, thereby preventing fevers and kindred affections. World's Dispensary Medical Association, proprietors, Buffalo and London.

THE THROAT.—"*Brown's Bronchial Troches*" act directly on the organs of the voice. They have an extraordinary effect in all disorders of the Throat and Larynx, restoring a healthy tone when relaxed, either from cold or over-exertion of the voice, and produce a clear and distinct enunciation. *Speakers* and *Singers* find the Troches useful.

Burnett's Flavoring Extracts are used and endorsed by the best Hotels, Confectioners, Grocers, and the first families in the country.

The Markets.

THE GIST OF THE MARKETS.

London, Feburary 10.

THE BRITISH GRAIN TRADE.—The Mark Lane express, in its review of the British grain trade for the past week says: "some little progress has been made with field work, which is still behindhand in some districts. The land, however, is now in good workable condition. Reports relative to winter-sown wheat are favorable in those districts where it has appeared above the surface. The damp weather is unfavorable to threshing. Really dry samples are practically unobtainable. Even fair average lots are rare. Trade both at Mark Lane and in the country has been exceedingly dull. In consequence of this and bad condition millers would scarcely look at English wheat last Monday, and a decline of 1s. to 2s. per quarter was quoted even on best parcels, the provincial markets following suit. Dense fogs also seriously interfered with business in London. The imports of foreign wheat into London have been moderate, but at Liverpool the arrivals were more liberal. Last Monday's decline of 1s. per qr. has not been recovered, as the consumptive demand was very small, but there has been no further reduction. Oats were depressed in consequence of large imports. Maize was steady, owing chiefly to its scarcity on the spot.

SPCIALS FROM ALL CENTERS.

Until Saturday, Feb. 21.

Baltimore.—WHEAT: southern red at $1 40@1 50: do amber at $1 50@1 55; No. 1, at $1 56; No. 2 western winter red, spot and February, $1 49; CORN: southern white at 61c; do yellow, 58c; western mixed at 45@46c; Penn at 47@48c. RYE dull at 90@91c. HAY steady; prime to choice Penn. and Md. at $11@12. FRUIT we quote apples at 5@6c. for quarters, 6½@7c. for sliced and 9@10½c. for fancy; peaches 6@8c. for unpeeled and 10@13c. for peeled: Blackberries 8½@9c; whortleberries 9@10c; pitted cherries 14@17c. and raspberries 25 cents per pound. MILL FEED.—City Mills stock is quoted at $20 per ton for middlings, $22 for brownstuff and Western at $18 75 per ton. POTATOES: Rose at 55@65c, and Peerless at 50@55c. per bushel the latter for lots from warehouse cellars. POULTRY undrawn Turkeys at 10@11c. and chickens at 7@8c. per lb., and drawn stock 1@2c. higher. SEEDS. Clover, Western car lots at 8@8½c. per lb, and jobbing lots ¼@½c. higher. Timothy is quoted at $2 90@3 per bushel jobbing. TOBACCO Maryland—Inferior and frosted at $1@2; sound to good common $4@5 50, middling $5 50@7 50; good to fine red $8 50@12; fancy $12@14; up-country $13@15; Ohio—Inferior to good common $3 50@5 50; greenish and brown $5 50@7; medium to fine red $7 50@10; common to medium spangled $6 50@12; fine spangled to yellow $10@20.

Boston.—CORN quiet but steady sales of mixed and yellow at 59@62c. OATS selling at 50@23c. for No. 1 and extra white: 45½@49c. for No. 2 white; 47@48c. for No 3 white and No. 2 mixed. RYE small sales at 95c. Shorts selling at $22@22 50; feed and middlings $23@24 50. ASHES steady with sales of Pots at 4½@5c. and of Pearls at 6½@6¾ ₱ lb. BEESWAX. We quote white at 40@60c., and yellow at 24@28c. ₱ lb. HAY AND STRAW—Rye Straw continues rather quiet. PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 21, 1880.

BEANS AND PEAS.—The bean market has suffered a rather long period of dullness for this part of the year and sellers have been forced to shave prices. With the new figures trade has revived in marrows and there is a more active outlook for other sorts. California is sending samples of pea beans. They are good looking stock for quality, though their greenish tint make them unattractive as yet. No settled quotations. There has been a good movement in turtle soup beans during the week. Green peas in higher demand and prices are firmer. $1.80@1.85. Other peas almost nominal. Southern B. E., $2.25 per 2 bush. bag; marrow beans, prime, $1.70; fair to good, $1.60@1.60; medium, prime, $1.45@1.47½; medium, fair to good, $1.35@1.40; pea, choice, 1.65@$1.70; fair to good, $1.45@1.55; white, kidney, choice $1.75@1.80; fair to good, $1.60@1.70; red kidney, prime, $1.70; fair to good, $1.55@1.60, turtle soup, good to prime; $1.75@1.80.

Receipts of beans, 3,789; exports, 1,000 pckgs.

BROOM CORN—Demand is moderate and prices steady. Quotations are for choice brush at 9c.; choice hurl at 8c.; stalk braid at 6@7c.; mixed red and green at 5@6c.

BUTTER.—There has been quite a sharp demand for butter, and more stock would have gone into use, if desirable high grades were more abundant. As it is, the little spurt is a welcome one, inasmuch as it helps to keep the later line of speculators from losing heart. Those who have had top styles to offer, have made about their first profit. There are full indications that all fine table stock will go out high or at least well. The export trade has been in fair proportion to the receipts 5,500 pkgs. for the week; shippers have paid as high as 20@21½c. for their best wants. Western dairy is in moderate supply, and fortunately there are marks of factory that furnish those who run upon Western. All fresh butter sells upon arrival when it has quality merit—if it has not, it has to take its chance with other undergrade.

Creamery, fresh, best invoices, 38@39c.; good to prime, 34@36c.; fair to good, 30@34c.; poor to fair, 27@30c.; fall made, 25@30c.; early made, 20@25c.; pails and tubs, fall, choice, 30c.; good to prime, 26@28c.; fair to good, 24@25c.; poor to fair, 20@24c.; single dairy, fresh choice, 30@32c.; good to prime, 26@28c.; fair to good, 23@25c.; entire dairies, choice, 26@27c.; good to prime, 24@26c.; fair to good, 22@24c.; poor to fair, 20@22c.; bodies of dairies, choice, 17@26c.; Western imitation creamery, 22@26c.; dairy fresh, extra, 24@26c.; good to prime, 22@24c.; fair to good, 20@22c.; poor to fair, 18@20c.; fancy, 24@26c.; prime, 21@22c.; fair to good, 19@20c.; poor to fair, 17@19c.; very poor, 14@15c.; roll butter, prime, 17@22c.

Receipts for week, 22,425 packages.

CHEESE.—Expor's for the week, 8,700 boxes, showing a continued moderate degree of interest among exporters. Home demand is without much activity. Prices are steadily held and State factory are as follows; Strictly fancy, 14¾@15c.; choice at 14¼c.; good to prime, at 14@14¼c; fair to good, at 13¾@14c. State farm dairy: Good to prime at 14¼@14¾c.; fair to good at 13¾@14c. Wisconsin factory: Fine, 14¾@15c.; good to prime 13¾@14¼c. Ohio factory: Cheddar, fine, 14¾@14¾c.; do., fair to good, 13@14c.; flat, fine, 14¾@15c. flat, good to prime, 14@14¼c.; flat, fair to good, 13@14c.

Receipts for week, 8,975 boxes; exports, 8,600 do.

Liverpool cable, 73s.

Steam, 25s.

COTTON.—Has been fairly active and closed strong at for February, 13.10c.; March, 13.12c.; April, 13.03@13.34c.; May, 13.54c.; June, 13.72@13.73c.; July, 13.82@13.83c.; August, 13.90@13.92c.; September, 13.40@13.44c.; October, 12.59@12.62c.; November, 12.29@12.32.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

NEW BOOKS.

KINGS IN EXILE. Translated from the French of Alphonse Daudet, by Virginia Champlin. 12mo, cloth, $1.00; paper, 50 cents.

"The superiority of this story to even the best of merely clever, even if supremely clever, stories, is most marked. One is pleasing in just the way that paper is pleasing, the other is something taken from human life. As to the way in which the characters are drawn, too much cannot be said in praise. They are all set vividly before us by their position, while the pathetic story is one that is every day repeated before our eyes in other circles of society.—[Atlantic Monthly.]

ABOUT GRANT. By John L. Swift. Red cloth, price $1.00.

"It runs through the war with brief, meaty chapters; setting forth all the great captain's glories; his snatching victory from defeats, his comprehensive view of every situation and his conquering persistence from Belmont to Appomattox. All these are excellently presented, and they furnish the indestructible ground of Grant's popularity, his hold on the regard of the nation, his title to historic fame; thence also, all the arguments for him as the needed 'strong man' are drawn."—[Springfield Republican.

ARITHMETIC FOR YOUNG CHILDREN. By Horace Grant. American edition, edited by Willard Small. Cloth, 35 cents.

This book was originally published under the superintendence of the "Society for the Diffusion of Useful Knowledge." The author adopted as a primary rule that no illustrative lesson should be inserted which had not been variously tried and found to sustain attention by its own interest in the minds of the pupils. Children, he says, in his instructions to teachers, ought not to be perpetually harrassed with dry questions. *The grand object is to cause them to exert their minds with pleasure;* and for this a lively conversation is the most effectual means.

AUTHORIZED FOR USE IN BOSTON SCHOOLS.

Reading for the Young.

REMINISCENCES OF A LITTLE GIRL.

MRS. M. J. GALPIN.

CHAPTER II.

ABOUT this time young Father Silk commenced reading the bible and gradually found that there was another light in which to view it, besides that of Romanism; but his progression was slow, as he was held by shackles as of iron. His vows, his early training and everything else combined to keep him still within the fold. But there was a "reserved power" in our friend Tommy, that only needed circumstances to develop. The bishop and priests commenced to sniff something wrong, and Tommy was called upon to explain how matters stood. After a general confession, and receiving the threats of the "Anathema" of the church, he was awarded enough pennance for his derelictions to wear out a dozen pair of knees. Likewise was he to live on bread and water, till he had subdued his mortal, sinful flesh, but the iron had entered Tommy's soul, and light and love could not be driven out so easily. The image of the charming woman who had ensnared his young heart could not be forgotten. Using his position as priest to better advance his cause, he called at the home of his unknown darling and found that she was the young widow of an East India officer and the mother of three children. But even these overwhelming obstacles did not efface his regard. Her father, a Scotchman, and a member of one of her Majesty's Highland Regiments was a fierce man, one who was addicted to his "cups," and when under the influence of liquor it was safest to keep out of his reach. Roy McGregor was a "caution" to all around. Several times, according to the rules of the British army, had he been sentenced to be flogged for drunkenness and misdemeanors but his gentle little wife always interceded for him so pathetically, that she succeeded in having his punishment extend no further than the guard house. Roy McGregor was almost gigantic in size, and a perfect Hercules in strength, while his wife was a dove-like gentle creature who hardly dared say her soul was her own. They had a family of ten handsome children, who almost worshipped their mother and dreaded their ungovernable father. Tommy's "inamorata" was the eldest of the girls who had only a short time previously come back a widow with her husband's regiment. Now when McGregor was in his cups, he would send all the priests and churches to hades, but when sober he was the most abject of sinners. He did not at first notice Father Silk's frequent visits to his house, as he supposed they were caused by the concern the holy father had about his own unregenerate soul, so that "Cupid" had a fine chance to do all the mischief he could, quite unsuspected by all parties. Hour after hour and day after day the bonds that held their souls in thrall grew stronger, till it became evident to both, that they were drifting to the edge of a dangerous precipice, over which they might fall at any time.

Months rolled on, till at last matters were brought to a crisis by McGregor himself, who had found eyesight to see what was going on around him. He arose in his wrath, threatened to kill his daughter and that turncoat priest, if he should ever enter his house again But love laughs at all dangers and will have his own, even if it be in the face of death. Tommy concluded to give up the church, his faith, and all else, to marry the woman he adored, come what might. So one night when one of those terrible wild storms, that rage so often in Ireland, was blowing, he quietly left the bishop's house, and through wind and rain, found his way to McGregor's, where his dear Katie was already expecting him, the giant Roy lay asleep from the effects of his pot of "potheen," and all else being quiet, she left the house and joined Tommy in the garden. The wild wind blew and shrieked through the mountains; the rain poured in torrents, as if determined to drown out that ostracized unfortunate couple, but hand in hand they breasted the storm, until they came to the edge of a bog. Here lived a discarded priest, commonly called a "couple beggar," and standing before this outcast from the priesthood, the ceremony was gone through with, that bound them as man and wife. The bride's heart was almost broken with the fear that her angry father, in a fit of drunken passion, would kill her helpless little ones, as he had often threatened to do, and Father Tommy dreaded the curses and anathemas of the church. I tell you, dear children, it was a dear bought love, and through years of toil and privation, this love was the only sunbeam that brightened their pathway.

If any of my little readers are Catholics, don't think for a moment that I have anything against Romanists personally, although I do not believe in their creed. Some of my dearest friends are Catholics, and I have a score of relatives that are Catholics also. There has been more persecution done in the name of religion, than in any other cause, and before I get through with Father Tom and his little girl, you will see that those of the "orthodox" faith can persecute about as well as those of Catholicism. I do not say that Tommy did right in deviating from the priesthood, but his course is to some extent excusable. I will tell you in another chapter of the wanderings of this fugitive pair, who had thus risked all for the privilege of loving each other. Your heart will be touched by their misfortunes ere I am through. So good-bye, till we meet again.

THAT BROTHER OF MINE.

Or Horticulture in Doors—Spiced.

MRS. M. L. SAYERS.

"BLISS, how do you reckon Tradescantia got to be called Wandering Jew?" said Will, as he stood trying to float a light shell on the surface of the crystal water in a clear glass jar. (It would float whenever the opening was turned down.)

"Oh! because it travels so mysteriously and gets all over one's little world of a window garden before one is aware of it," and Bliss reached up to pluck out a streamer which had stretched across and invaded a pot of Geraniums to its discomfort.

"But Bliss, isn't it strange that such a traveler should be so green looking? Why, that cornucopia fellow is a regular *greenhorn*," and Will's black eyes twinkled with satisfaction at his fun.

Bliss laughed as she was expected to, and said. "while the Wandering Jew is said to go wandering about the world, he never holds any communication with man, and may be ignorant and green as you say; we are apt to respect mystery more than it deserves, and also travelers or sight seers, but see there! your shell has sunk, and see how it is magnified! it is just beautiful. Hold the jar up."

"Oh! yes," replied Will, an "aquarium! Give me that sprig of Wandering Jew, Bliss. Now, old fellow, you must be a sort of amphibious animal, or you couldn't cross seas, and rivers, and bogs, and gulfs; I'll try you in water awhile," and Will put the sprig in the jar.

Bliss watched the rootlets spread out thread-like and delicate, and as she noticed a thousand little hairs bristling along these threads, (being magnified in the water), she exclaimed, "Oh! Will," but Will was gone, and she resumed her investigations.

"Hallo, Bliss! Now for the study of *e-k-e*—ich—oh!—what is it Icabody?" said Will, bursting in with an old bucket in his hand.

"Oh! yes, I see you have some fish—you mean ichthyology," said Bliss.

"Yes, I mean *ichthyology*. Get in there, you little *scaly*-wags," and Will dropped two tiny minnows into the jar. They darted and whisked through the water, and when held in the sun, reflected all the colors of the rainbow. Bliss absorbed in watching their graceful movements had forgotten Will, till he bounded in again. "Now we must feed these little *flirts*," said he, and dropped in an angle-worm which began stretching, drawing up and squirming in every direction. Bliss recoiled, for it was magnified till it looked like a baby snake. It at first frightened the fish. "Now study him Bliss. What sort of *ology* do you call that? He's on a *bender* and stretcher, too. Strange, without any feet he can exhibit so many *feats*," and Will was again delighted.

"But the fish can't eat that great worm, Will, let's try something reasonable," said Bliss, as she got some cracker crumbs and made them quite fine. One of these was soon inhaled, blown out and inhaled again, and she could see quite distinctly the fish masticating it. In the afternoon Will called her attention to the fish gasping at the surface of the water. The jar had set in the sun and the heat had helped dispel the oxygen. Bliss emptied the contents in a basin, wiped the jar and returned the shell, Tradescantia and fish, and added a sprig of coral and some moss-like evergreen (feathery and beautiful), and fresh water. This she repeated once a day, and learned, after three weeks' experience, that warmth was detrimental to keep the water fresh and charged with oxygen, that the fishing-worm went to sleep every night in the little couch-shell, that cracker crumbs, stiff cream and tiny worms from the flower pots, were good food for the fishes, that the Wandering Jew threw out roots readily in the water, and that an aquarium even made of a glass fruit jar afforded her a vast amount of pleasure and some instruction.

Letter from "Will."

LOPEZ ISLAND, Wash. Ter., Jan. 15, 1880.

UNCLE MARK:—What witchery is this that you carry on, in the department for the young? Here is *myself*, portrayed, and my sayings and doings brought to light, in "That Brother of Mine." Ah! those happy days of my boyhood in "Old Virginia!" I was surprised to see I had got into print, and your readers will be more surprised to learn that happy, careless unthinking Will is a great big man with the responsibilities of the best little wife and the *cunningest* little babe in the world, and cut off from that sister and all other kindred, by thousands of miles, away and away off here upon an Island of the Pacific. Here, I brought my bonnie bride two years ago, to try my fortune in a strange land. We found friends among the Indians, and settled upon this Island first, and began life in primitive style. Thanks to the skill acquired in making those flower fixings I could use tools right dexterously, and soon had our humble abode furnished with chairs, bedstead and other necessary articles, of my own manufacture; while Pink cooked our frugal meals and "astonished the natives" with gay quilts of brilliant colors. However, not being accustomed to "dig for a living," I soon got tired of toil, and looked about for a place where it would spring up spontaneously from the ground. We moved to San Juan Island. We move here in boats, and by the time we were well installed, a new joy came to our home.

That cunning little babe brightened the very walls of our rude home. What if we should loose this incentive to new endeavor in a strange land! I thought of my mother then, the pain it had cost her to part with her boy and feel she would never look upon him again, all for a foolish freak. We named our baby Jane for that mother who had been so kind and forbearing, but in honor of the isle of birth, called her Juaneta which is the Spanish for Jane and is pronounced Wa-neta, just as San Juan is pronounced San Wan, which means St. John. I had now a new spur to urge me on, and by dint of hard work, I finally had sufficient money ahead to pay for a "claim" on Lopez Island, to which I returned, built me a house, and am now ready to begin life in earnest. As one help, comes the RURAL NEW-YORKER, sent by *That Sister of Mine*, I know, that I may reap the benefit of its harvest of good things. Is it well though that she inspired me with the love of the beautiful when I have no means of gratifying that love? Ah! yes, it is well—"*All* is well that ends well," and I hope one day to be able to place my Spanish maiden in a bower of beauty. At present, I must be thankful for such opportunities as your free seed distribution, gives one in my situation, and for the room which you give little Juaneta in the Horticultural Club. We shall look after her plants till she is old enough to take pleasure in the flowers which spring up in her path, even in the winter of adversity; just as these fair daisies clothe the ground here now, while thousands can look only upon snow and ice. But my letter grows too long. More another time.

"THAT BROTHER" WILL.

The Puzzler.

HIDDEN DRUGS.

1. In the month of May apple trees bloom.
2. Her hub, (arbutus wood) soon split.
3. In camp hornets stung us.
4. This pig Eli attempted to drive.
5. The nit, Rica, cidar will kill.
6. Lenux vom! I care not.
7. Mr. Frenchy said wiz tremur I at Ica, cidar drank.
8. We ran through intricate church-yard paths.
9. 'Twas a cub Ebenezer shot.
10. Lecopa, I vaccinated baby.
11. In so tan in dyeing woolen.
12. Miss Ella, vender of fruit.
13. If you nip Peca, Charley shall punish you.
14. To hear music Hamo, miles I would run.
15. Ask in Otis' store.

☞ Answer in two weeks. L. O.

OUR WEEK'S GROCERIES.

1. The soldiers were so daring that the enemy were conquered.
2. The state ardently welcomed the president.
3. Sir: up yonder is a farm for sale.

PERSONAL ITEMS.

Senator Edmunds has saved between $200,000 and $3000,000 in fees from his law office.

The daughter of Ex-Secretary McCulloch is reported to be the best amateur banjo player in New York. She has made it fashionable for young ladies to play the banjo.

Beecher has coined a new phrase—"heavenly drunkenness"—which he applies to a person who has "too much religion." Mr. Beecher himself is not that kind of a drunkard.

PROFESSOR FREDERICK PECK, a scientist, formerly connected with the Agricultural Department as botanist, died at the Washington Almshouse on Wednesday last and was buried on Thursday by some of his personal friends, the interment being made in the Congressional Cemetery. He was 73 years of age.

THE two new ladies-in-waiting who have this year come out with the Princess Louise to Canada are both of them fair widows. One, Lady Pelly, a daughter of Lord Elcho, the originator of the great English volunteer movement, is the widow of Sir Henry Carstairs Pelly, Bart., who died in 1877, and the other, the Hon. Mrs. Langham, a daughter of Lord MacDonald, of Antrim, and a sister of the Vicountess Tarbat, is the widow of Captain Algernon Langham, of the Guards, who died in 1873.

KIDNEY-WORT
The Only Remedy
That Acts at the Same Time on
The Liver, The Bowels and The Kidneys
This combined action gives it wonderful power to cure all diseases.
Why Are We Sick?
Because we allow these great organs to become clogged or torpid, and poisonous humors are therefore forced into the blood that should be expelled naturally.
KIDNEY-WORT WILL CURE
Biliousness, Piles, Constipation, Kidney Complaints and Diseases, Weaknesses and Nervous Disorders.
by causing free action of these organs and restoring their power to throw off disease.
Why Suffer Bilious pains and aches?
Why tormented with Piles, Constipation?
Why frightened over disordered Kidneys?
Why endure nervous or sick headaches?
Why have sleepless nights?
Use **KIDNEY WORT** *and rejoice in health. It is a dry, vegetable compound and* **One package will make six qts of Medicine.**
Get it of your Druggist, he will order it for you. Price, $1.00.

Humorous.

Not Settled Which.

I TELL yon, you brute, one of us two has got to give in.

From Fliegende Blatter.

Various.

BRIEFLETS.

RENDERING a loose or dry soil firm after seeds are sown, by a roller or by the feet is an aid to their germination. But if the soil is moist when seeds are sown, the use of a roller or of the feet is to be avoided. . . If tender seeds —egg-plants, tomatoes, &c.,—are sown in the same hot-bed with cabbages &c., one or the other class must suffer as the one needs air, the other heat. . . The World says to Mr. Parnell, "Go East, young man; go East!" . . Mr. Beecher says that the man who can learn to love tobacco can learn to love anything under heaven. There are harder things to learn to love, Mr. Beecher, than tobacco. . . And now A. B. Allen makes a plea for polled cattle. . . Some of the farmers of Canada "in convention assembled" expressed the belief that the soil lives to eat and as well as the farmer ought to be fed; that every farm should own a good farmer; that the fertilizer of any soil is a spirit of industry, enterprise, and intelligence; without which, lime, gypsum and guano would be of little use. . . In speaking of the new "American Banner Rose" a month or more since we said it resembled a sick Bon Silene. It seems it *is* a sport of Bon Silene. We trust Bon Silene will amuse herself more creditably in the future. . . The very soul of market gardening is manure. . . Farmer Mechi's (England) balance sheet for 1879 shows a balance on the wrong side—the first in 15 years. . . Mr. Read tells Englishmen that we say that the difference between protection in England and America is that here it is a protection for the back—there protection for the belly. . . Mr. Read concludes, as a result of his visit here, that there is no country like England. . . He further concludes that nowhere in the world has the almighty dollar such an influence as in the United States. . . There is a most powerful aristocracy here as well as in England—the aristocracy of money. . . Our whole country is addicted to gigantic speculations. . . Rich men in America do not retire from business and take to farming, but they continue on in business and die in harness. . . Americans take grog, says Mr. Read, as Englishmen take physic. They walk up to the bar and, taking a small glass of whisky, toss it off and follow it up with a glass of iced water—just as children in England take castor oil. . . We hope that Mr. Read's agricultural observations have been as careful as his *other* observations. He found that although the barrooms were ostensibly closed on Sundays, there was a "back entrance" always open. . . He did not find this out until he had been obliged, one Sunday night, to retire thirsty. . . Mr. Ritter says he likes this world the best of any world he has ever lived in and dislikes the idea of leaving it, . . It is stated that the wholesale oyster trade of New York amounts to $25,000,000 a year and that of the Chesapeake to about the same. . . Americans may be said to have been the first to recognize the general utility of the oyster, and to have turned it to account in cooking, by stewing, roasting, broiling and frying. . . To avoid miscarriage, raise your abilities, or lower your aims. . . Thoughts and Events remarks:—"Ah, liberty is a fine thing,—but not liberty to steal, say. So, it is a fine thing to be able to throw off restraint, but it must be an improper restraint. Leading-strings are inconvenient, but they are good things for the infant unable to walk without them. The lunatic does not know his own business, but the physician who orders a straight-jacket for him does." . . A throne is a very imposing thing till you come to see how small a man sits upon it. . . Among onions, White Globe, Yellow Danvers and Large Red Wetherfield are the best sorts for main crops. . White Portugal is one of the best onions for pickles. . . . It is economy to bear in mind that few novelties are essentially better than the best old sorts. . . Now is the time to select Roses —the Hybrid Perpetuals and Mosses for hardiness—the Ever-blooming Roses for flowers. The last bloom more continuously than the former and for the Southern Middle States and further South are more desirable. The first and second classes are better for the North. . . The quite common practice among our farmers of hiring new help every season is, in our judgment a bad one. . . After a hand has become accustomed to a place and has learned the ways of the family and the methods of his employer he is much more likely to take an interest in his work, than does one who understands that he has but a short time to remain. Maine Farmer. . . Oat meal is a wholesome and cheap article of diet. It ought to be the staple of the supplies given in charity to the poor. . . NON-POISONOUS FLY-PAPER: Quassia chips, two ounces; water, one pint; molasses, two ounces; boil the quassia in the water, strain add the molasses, and in the liquid soak bibulous paper, which is then hung up to dry. Chemical Gazette. . . . . Beurré Giffard, one of the best of early pears; medium in size; juicy, melting flesh—excellent flavor. Must be gathered a week before fully ripe. . . Rosticzer and Tyson are popular sorts; the first for excellent quality and great productiveness, the second for its larger size and the equal excellence of the fruit. Rather a tardy bearer. Both ripen in late August. . . Petite Marguerite is an excellent little fruit, also ripening in late August; very productive. . . Manning's Elizabeth is fine. Osband's Summer is good. Dearborn's Seedling and Bloodgood are fine old pears. Brandywine is variable but usually a good late summer sort; and Ott, though small, is very good. The above pear notes we have condensed from an article in the Country Gentleman. . . In Minnesota 123 gallons of sirup were obtained from half an acre of Amber cane. The yield in other cases was from 150 to 176 gallons per acre, which of itself pays very well. . . Crystals of Copperas, it is said, put in their holes, will effectually drive rats and mice away. It does not cost much to try it. . . In the new Catalogue of Cole and Brother (Pella, Iowa) we find many of the most desirable of the seeds of our Free Seed Distribution offered, which is a gratifying proof of their value. Among them we note the Voorhis Watermelon which Mr. Cole finds to ripen through a longer season than any other sort; the Golden Rural tomato; Blount's corn; Beauty of Hebron potato; the Rural Bronze Ricinus; Hibiscus Moscheutos etc., etc.

Results Tell the Tale.

What may we reasonably infer from the success of a medicine which is sent far and wide, not only in the land of its discovery, but in foreign countries, which has met with the indorsement of medical men, the annual preparation and shipment of which employs a small army of employes, and the outlay upon which, in various ways, is simply enormous. We must, if candid, award to such a remedy, the meed of well deserved success. Such a medicine is Hostetter's Stomach Bitters, the leading American remedy for fever and ague, liver complaint, dyspepsia, debility, nervousness, rheumatism, and various other physical troubles. It early took precedence among tonics and alteratives, and has steadily maintained it. Persons of a weakly physique state its recuperative properties to be remarkable, both in degree and the matter of promptitude, and the billous give a particularly good account of its effects.

DREER'S GARDEN CALENDAR

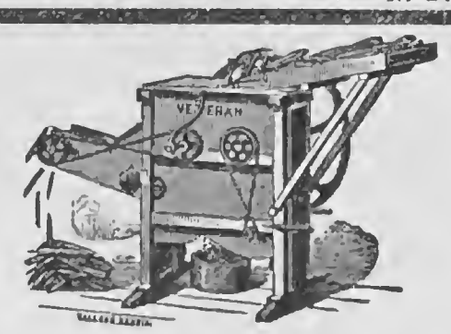
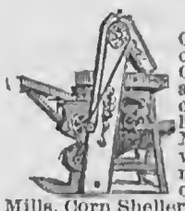
NEW CATALOGUES

The following Catalogues have just been published and will be sent to all applicants as follows:
No. 1—**Fruits,** 64 pages, plain, 10c., with colored plate of "Waterloo" peach, 15c.
No. 3—**Green & Hot-House & Bedding Plants,** FREE.
No. 4—**Wholesale,** FREE.]
No. 7—**Catalogue of Strawberries,** with colored plate, free.
A **List** of **New Roses** for 1880, 12 pages, free. With colored plate of five rare and beautiful Roses, 10c.
Our handsomely illustrated Catalogue of **Ornamental Trees, etc.,** (No. 2,) will be ready about March 1st. Plain, 15c., with colored plate, 25c.
Address,
ELLWANGER & BARRY, Rochester, N. Y.



Veteran Corn Sheller
FOR HAND OR POWER.
Just the Thing for Mill, Farm or Plantation.
Power and Hand Corn Shellers of all sizes and to suit all wants.
HORSE POWERS, JACKS, &c.
Write for Descriptive Circulars and prices. Address SANDWICH MANUF'G CO., Sandwich, Illinois.

I. X. L.
Feed Mill
ALL IRON BUT THE HOPPER.
Cheap, Effective and Durable.
CAN BE RUN BY ANY POWER.
Capacity from 6 to 30 bushels per hour, according to size. Send for Catalogue "B," &c.
U. S. WIND ENGINE & PUMP CO.,
Batavia, Kane Co., Ill.



CHALLENGE FEED MILLS.
Grinds three times as fast as any other mills. Always successful. Over 500 First Premiums and Medals. Over 15,000 in use. They do not clog or heat; grinds 60 bushels per hour. All successful Iron Feed Mills *infringing our patents.* Beware: Buy none but the best. Remember the Courts have sustained our Patents. Also, the best Wind Mills, Corn Shellers, Horse Power Wood Saws, Fanning Mills and Pumps. Address
CHALLENGE MILL CO., Batavia, Ill.

COOLEY CREAMER.

Awarded Gold Medal at Paris Agricultural Exhibition, 1879.

Butter made by this process, awarded Sweepstakes at International Dairy Fair, 1878, and Two Gold Medals and First Premium at same fair, 1879. First Premium at Royal Agricultural Exhibition, London, 1879.

It requires no milk-room.
It raises all of cream between milkings.
It affords better ventilation.
It requires less labor.
It is more thoroughly made.
It is cheaper,

and gives better satisfaction than any other way of setting milk.
Send for "Dairymen" giving full particulars and testimonials.
VERMONT FARM MACH. CO.,
Bellows Falls, Vt.

Mill Manufactory
Established 1851.
CRIST MILLS,
Of FRENCH BUHR STONE
Portable Mills for Farmers, Saw Mills etc.; 16 sizes; over 2,000 in use. Price from $30 up. Complete Mill and Sheller, $95. A boy can grind and keep in order. Adapted to any kind of suitable power. Complete Flouring and Corn Mills.
NORDYKE & MARMON CO.,
Indianapolis, Ind.

THE GREAT AMERICAN TEA COMPANY
31 & 33 Vesey St.
P. O. Box 4235, NEW YORK.
Stores, Hotels, Restaurants, Club consumers will find to send Postal Card dress, and get the
Boarding Houses Agents, and larg it to their interes to the above ad latest terms.
N. B.—Beware of imitators.
NO HUMBUG.

STRAW BERRIES Grapes AND Currants.
RASP
BLACK
GOOSE
A superior stock of PLANTS of all the *good old* and *choice new* varieties—including the CUTHBERT Raspberry, Glendale Strawberry and Duchess Grape. My catalogue (free to all) gives instructions for culture, *honest* descriptions and *fair* prices. J. T. LOVETT,
Little Silver, Monmouth Co., N. J.

THE STRAWBERRY.

INSTRUCTIONS AND SUGGESTIONS FOR ALL.

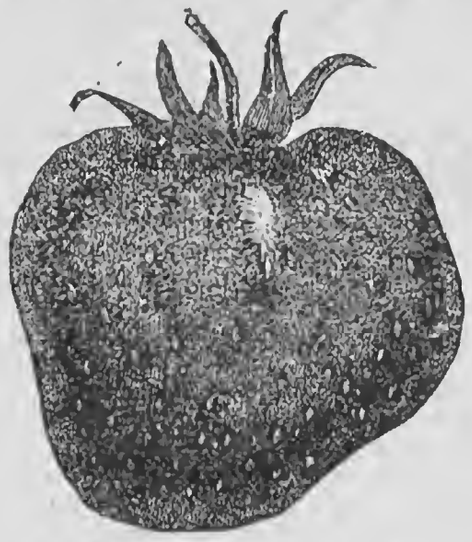
Seasonable Hints.

NOTES FROM THE RURAL GROUNDS.

As Nature is about awakening from her winter's slumber and putting on her spring attire, our readers in town and country will begin to lay plans or prepare to develop and execute those already laid for the coming campaign. Among these plans a bountiful family supply of the earliest, most welcome and delicious of all our summer fruits—the strawberry—should not be neglected. We have heretofore devoted considerable space to this subject in various ways, but for the benefit of our new readers, as well as for those of our old ones who require a frequent reminder before they can make a "new departure," we present the subject again—thus early; with such practical, and seasonable hints as may be needed for their direction.

Preparation of the Ground and Setting the Plants.

Experience has taught us that the Strawberry responds to high and liberal culture as readily



MONARCH OF THE WEST.—FIG. 67.

as any other crop. The soil should be good and free from weed and grass seeds, for the profit of a strawberry crop in field or garden is largely due to the amount of labor bestowed upon it. If the vines are allowed to take care of themselves and dispute their right of possession with white clover, sorrel and weeds of every description, there will be little profit or satisfaction in the attempt. If limited to a small garden where all the work is to be done by hand, select the cleanest piece of ground; that is, one that has been hoed and kept clean all through the past season, where no weeds have been allowed to ripen their seeds. We will suppose such a piece to be a rod wide. Spade it up and work it until mellow, incorporating a good supply of fine rotted manure, if attainable; otherwise sprinkle a dressing of fine bone on the surface and rake it in.

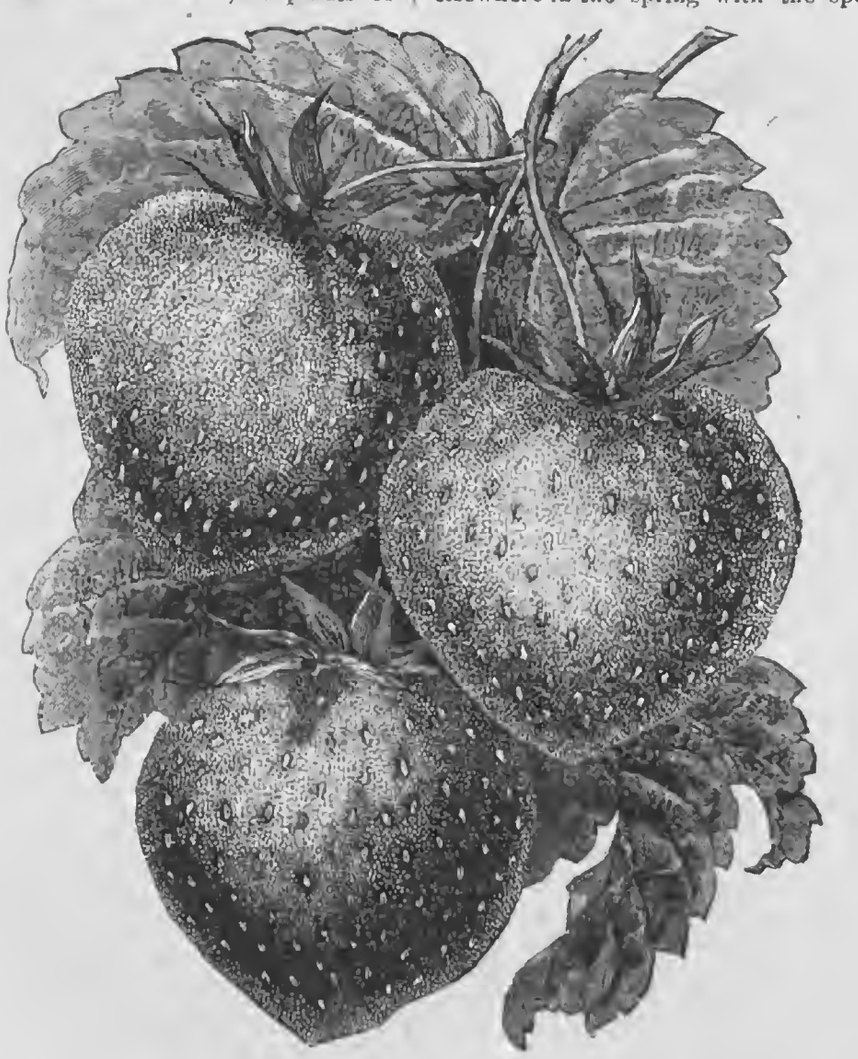
Having received your plants, unpack them—one kind at a time—remove all runners and dead leaf-stalks, and set them in a pail of water. Then proceed as follows:—Let this column represent your ground, make three marks across it 18 inches apart. Then plunge the trowel straight down across the line one foot from the end, drawing out the earth towards you. Take a plant, straightening out the roots *fan-shaped*, and set it against the *back* of the hole which should be *deep* enough to allow the roots to extend *their whole length*. Our experience is that when the roots are *spread out* near the surface, the berries do not grow so large and the plants suffer more readily from drought. Then fill in the earth and press it and the plant against the back of the hole with the hand or foot. Instead of a trowel, the spade may be used forcing it down, face to the workman, square across the line and bringing it forward, thus making an opening for the plant. Remove the spade, again pushing it down in front of the opening. Set in the plant and press the earth back against it with the spade. Set the plants two feet apart in the rows as shown, pinching out any fruit stems that appear.

* * * * * *
* * * * *
* * * * * *

Three feet from this bed start another in the same way, which is equivalent to omitting every fourth row for a path which will be very convenient for picking the fruit without getting on the bed, especially if the good housewife or the girls of the family have to do it, which duty they will gladly assume, while often willing to include the care of the bed for the sake of the fruit.

Care and Cultivation.

Two such beds will require 50 plants; ten beds 250 plants on a little less than four square rods of ground. Five varieties, 50 plants of



CUMBERLAND TRIUMPH.—FIG. 69.

a kind early and late set this spring and well cared for, would give the family a table supply next year worth ten times their cost. By setting the plants this distance apart, it gives an opportunity to hoe and destroy a half dozen crops of weeds that spring up before the plants begin to run. As the runners appear, let but one, or at most, two

CHARLES DOWNING.—FIG. 68.

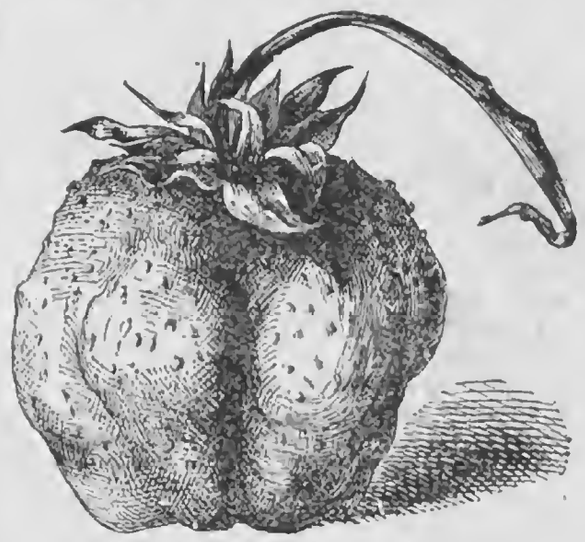
grow from a plant, leading them *in the row* allowing them to root equi-distant from each other. Remove all others as fast as they appear. Thus by fall there will be 500 or 750 strong plants that ought next year—accidents excepted—to produce from five to 10 bushels of fruit. Have some fine well rotted manure prepared, with which to give them a good dressing. Late in the fall when the ground freezes up, cover the vines lightly with leaves, salt hay, straw, corn-stalks, cedar or other evergreen boughs, as may be most convenient. Next spring in due time uncover the plants, leaving the covering between the rows. After the fruit is gathered if desirable the bed can be renewed on the same ground by removing the mulching and allowing sufficient runners to start and take root *midway between the rows*. When these are firmly established the old plants can be turned under, but this course tends to weakness and degeneration. A better plan would be to set a few plants elsewhere in the spring with the special design of producing plants for this purpose, and as soon as the fruit is gathered dig the old plants under and reset with new ones. This is easily done, in a small way, with a ball of earth attached, if the plants are handy, and they will hardly know they have been moved. This is better than potted plants. Where

Horse Culture

is available, it is of course much the cheaper method. For this, the rows should be four or five feet apart and the plants two or three feet apart in the rows; the greater distance is none too much for the strong-growing varieties, and if the matted-row system is to be adopted and no runners removed, six-feet between rows are little enough. The cultivator should be run frequently to destroy all germinating weed seeds as fast they appear, and with a little care and practice it can be run very close to the row, so that but little hand work will be required till the runners begin to root. Then the ground in the rows should be finely pulverized and the young plants distributed over the ground about six inches apart, gradually narrowing the cultivator and widening the row of plants, as they grow, to about three feet wide and clipping off all runners beyond enough to cover the bed evenly, as above. The same treatment as to manuring, covering etc., as given above for the beds described will give nearly or quite as large berries at much less expense for labor.

Soil and Situation.

The best soils for some varieties would not be the best for others. The Jucunda that grew to such perfection in the stiff clay soil of Mr.



SHARPLESS.—FIG. 70.

Knox at Pittsburg, is utterly worthless in the sandy or even stiff clay loams of New Jersey, with the same treatment given to others. Again, some varieties are worthless if allowed to run, exhausting themselves in making plants at the expense of fruitfulness. The Triomphe de Gand is a notable instance of this kind. Our readers will perceive therefore that the *best* Strawberry depends largely on the soil, treatment and culture given it, the taste of the individual, and the purposes for which it is wanted. For family use only, some people would not have Triomphe de Gand if ever so nice, on account of its musky flavor; others would reject the Green Prolific and Wilson on account of their acidity, while others think them about perfection. Tastes differ in the matter of strawberries as well as in any other fruit. To our taste we should eat and grow fewer strawberries than we now do if confined to either of the two last named, so that when we come to speak of quality our readers will understand we do not presume to speak for others. Situations sometimes have quite a desirable influence in lengthening the strawberry season. We have seen a difference of a week in the ripening of the same variety when grown on the south and north side of a wood, which no doubt was wholly due to different exposures.

The Best Manures

and the best time to apply are mooted questions. Probably, all things considered, well rotted barnyard manure composed of about equal parts of horse and cow droppings, is as

good as any. Wood ashes are also excellent; either of these can be applied with safety. The chief objection to the former is the seeds that abound in it. Were it not for these strawberry growing would lose half its terrors. We think the time of the application of any manure has its effect in a greater or less degree on the growth of the plant or the development of the fruit. We do not know to what extent this may apply, and it will require a good deal of experiment and careful observation to determine. We incline to the opinion, however, that any manure not needed to secure a strong and vigorous growth of plant, is best applied when the plant is dormant; then the fertilizing material becomes soluble; is carried down and stored in immediate proximity to the roots to be taken up and appropriated by the plant in developing and maturing a crop of fruit when awakened to life in the spring. The action and benefits of special fertilizers on the Strawberry are subjects on which little is yet positively known, and afford a good field for careful investigation. We urge our readers to make trials of these alongside of stable manure for comparison, and carefully note the results. The great advantage in the use of special concentrated manures, such as guano, phosphate, ashes, etc., is their freedom from seeds of any kind, and ease of application.

Tools, Etc.

The Hexamer and similar pronged hoes are the best implements we have ever found for working among the plants. Owing to their narrow tines they can be thrust down close to the plants at random without injury, loosening and pulverizing the ground thoroughly. Two tines of a broken potato fork, with a short handle, make a capital one-handed tool for weeding purposes and laying in the young plants. Such broken implements, instead of being thrown away, may thus be utilized.

The Best Varieties.

Here again opinions will differ. No one berry will suit all individual tastes, any more than one berry will succeed equally well in every locality and soil.

The Duncan and Duchess, of the older and well tested standard sorts, are of fair size and quality, very early and quite productive.

Downer's Prolific is also early and immensely productive, but not large enough to suit the popular demand, especially when allowed to run at will, but a dish of them well ripened, with a little sugar, is good enough even without cream. We used to think, before the advent of its offspring, the Charles Downing, that if confined to one variety it would be this.

The Charles Downing would be our choice now, however, as it is a berry of very good quality and large size, which is maintained to a great degree to the close of the season. The plant is vigorous and productive and succeeds generally over a large portion of the country.

Boyden's 30 is in some sections, as it certainly is here, very highly prized for its fine size, beauty and sweetness; though in other places after two or three pickings the berries run small and deformed. Nevertheless many good cultivators regard it as their best.

Crescent Seedling, though not an old sort has been before the public long enough to enable us to judge fairly of its merits. It is a pistillate variety of vigorous growth and very productive. The fruit, which is at first of medium size, runs small at the close. The quality is rather acid, though less so than that of the Wilson, which is, singularly enough, the standard of a great many people, and where quantity instead of quality is the object, it will be found in certain sections to answer remarkably well.

Monarch of the West has also attained a good reputation over a wide extent of country. It is a large, handsome light-colored berry of very good quality. The plant is a strong, vigorous grower, but, like the Boyden, the later portion of the crop is often small and deformed.

There are many others, such as Jucunda, Kentucky, Great American, Beauty, Centennial Favorite, and others of Durand's Seedlings which are successful in some localities and as complete failures in others. In regard to the latter it may be well to remember that they have been bred, born and reared under high culture, and the changed condition of things when transplanted to new homes is often so great that it may not be unreasonable to suppose that their failure is sometimes due to this cause; in fact, it would be folly to expect them to retain their good name with "slip-shod" care and culture. Large crops of large berries of any kind are not generally produced in that way. Of the

Newer Varieties.

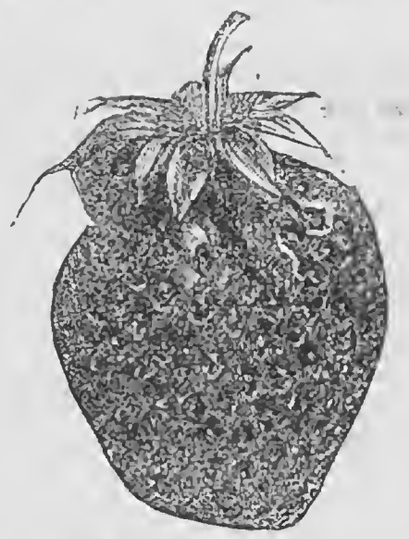
The Sharpless and Miner's Prolific stand at the very front for strong and vigorous growth and luxuriant foliage. In these respects they seem to distance all competitors. The latter bids fair to rival the Charles Downing in size and productiveness; but we think it hardly its equal in quality. Of the former, reports from our Everywhere Department confirm our experience as to its vigor and growth, while there is little question as to its fruitfulness; but another season or two are needed to determine *fully* the position to which it is entitled.

Forest Rose is another new one of excellent quality—a large, late, handsome berry, with a strong erect fruit stalk. The foliage is liable to injury during our hot weather, as was the case two years ago, but last year we saw nothing of the kind. It is considered worthless by some; but where it will succeed we think it will give much satisfaction.

Cumberland Triumph is a very large berry of excellent quality, though more desirable for the amateur than the general cultivator.

There are numerous others constantly being introduced which, if all that is claimed for them be true, must prove decided acquisitions—but as we look back a few years and see the fate of the great bulk of their predecessors, we are admonished not to be over-sanguine, and our advice to our readers is to make haste slowly and *to touch all new things lightly*. Thus may be avoided the vexation, losses and discouragements attending the opposite course.

The disease known as "Strawberry Blight," in some of its various forms sometimes appears when least expected and injures some varieties more than others, though few, if any, are exempt. Late frost and excessive drought may also sometimes injure the crop to some extent, but these notes are written without regard to such contingencies. They are among the risks to which all cultivators and crops are liable, but we think the strawberry crop is quite as certain to reward the husbandman as any other. This reward, however, we regard as accruing from an increased supply and consumption at home, and it is this feature we desire to encourage. *Strawberries should be on the table of the grower at every meal during their season.* Some peculiar people may shake their heads and object to this. "It might be good advice for grown people," they say, "but the children would stuff themselves and sicken in consequence, and the doctor's services would surely be required." Such opinions arise from the effects sometimes resulting from the use of the stale fruits and vegetables of our markets. Thousands of bushels of strawberries are annually consumed that are so far advanced in decay as to be fit *only for chicken and pig feed*, and yet people, otherwise intelligent, will and do buy such trash in preference to a really fresh article because it is cheap—though at the risk of introducing sickness into their families.



SETH BOYDEN.—FIG. 71.

Growers often complain at the low prices returned by the commission men for their berries and sometimes justly, no doubt, but in many instances if they could see their berries when they reached the market or when sold, they would place the blame elsewhere. The fact is *good, ripe, fresh* strawberries or fruit of any kind were not made by our Creator to injure any of his creatures and they seldom, if ever, do. Of all our fruits there is none more tender or delicate and susceptible to injury by handling than the strawberry, and for this reason it is ill-adapted to the rough handling and jarring incident to long transportation. It is a fruit that should be consumed within 24 hours after picking. Our large cities are overstocked every season with fruit 36 to 48 hours old, that ought to be condemned by competent health officers. We therefore would encourage a home supply and increased consumption in home markets of home-grown fruit.

Those who only know strawberries as they find them in our city markets, do not know the healthful luxury of a fresh and perfect article. With many growers their estimate of a strawberry is founded upon its carrying and shipping qualities; its merits as a table fruit being entirely ignored. It is due to the shipping quality of the Wilson that it is in such large supply in our large cities and the enormous consumption shows the appetite of the community for strawberries, even if of poor quality; and the fact that other and better varieties meet with a ready sale at better prices shows a discrimination in tastes, which should be met by an ample supply of better-quality berries of home growth.

Much might be said on the subject of markets and marketing, but a few brief hints at this time will suffice. If one has a surplus of fruit above his family wants, he should not go by a local market to a distant one that is already amply supplied. The nearer home, the better and fresher the berries, the quicker consumed, at the less expense for freight and commissions, and the fewer packages required, as they are more quickly returned. Let the fruit make a nice appearance, let it be uniform in size, clean, nicely arranged in the baskets, either pints or quarts, with no long stems or unripe berries visible, and, above all, have clean packages. The *very best fruit*, offered in dull, dirty and dingy baskets or crates, would be subject to discount. Remember that an important factor in this as well as any other enterprise is the pleasing of the eye. *An attractive appearance is essential to success.* In conclusion, we repeat the advice with which we started, to grow strawberries for home use, to grow plenty of them, and to *use them freely*. The profits of this course cannot be estimated in dollars and cents.

We shall continue, as heretofore—life spared—to test all new and promising sorts and to publish the results in these columns for the guidance of our readers.

The Colonel Cheney Strawberry.

Doubtless this is one of the varieties of Strawberries that succeed *very* well in *certain* localities. It certainly does not seem to be a popular sort with strawberry growers generally; but judging from the way it has produced on our grounds, it seems to me that it has not received the attention that it deserves. The plant is a vigorous grower and very productive. The berries are uniformly large and of a bright and attractive color. The fruit, although too soft for distant markets, is firm enough for home use or for a near market, and the large size and attractive appearance of the berries give them a ready sale. The past season it brought us, in Elmira, from one to two cents more per quart than any other variety we had. We have fruited this variety for market for three years, and with a market within two miles, we consider it the most profitable sort we have tried.

One great advantage which it has over most other varieties of Strawberries, is its ability to stand late spring frosts, and yet produce a good crop of fine fruit. It will be remembered by many that we had a series of severe frosts last May, which almost completely destroyed the apple crop in this locality and greatly injured all other fruit crops. In spite of these frosts which came while the vines were in blossom, the Col. Cheney yielded at the rate of 75 bushels per acre, while the Monarch of the West growing in the same field, was almost completely cut off, so that it was hardly possible to find a berry, and the Wilson and Cumberland Triumph were also nearly destroyed. The Col. Cheney is a pistillate variety, and should be planted within 15 feet of some other late sort having perfect blossoms. It seems to thrive best on a deep, rich, clay loam soil.

Chemung Co., N. Y. G. A. Goff, Jr.

Field Crops.

LEGUMINOUS FORAGE PLANTS.—NO. II.

PROFESSOR W. J. BEAL.

Pea-vine Clover.—Trifolium medium.(?) I have received from several sources, a clover much like the red clover. It is raised in some parts of Western Michigan and in other Western States. It is known as pea-vine clover. The stalk is stout and zigzag and the flowers later than those of red clover. Farmers usually pasture it for a while in spring, and then let it grow for one crop of hay or seed. It seems to be Trifolium medium, though I am not fully satisfied in regard to the species. One of my patches has lasted for three years. It is said to be perennial.

Italian or Crimson Clover.—Trifolium incarnatum—Our seeds were obtained from the Kew Gardens. I have sown a few on sandy loam every year for the last six years. It flowers quite late, and in our climate (Central Michigan) barely ripens a few seeds. These have not germinated very freely. Every year the winter has killed it entirely. Mr. Sutton, of England, writes, "Where a single crop is required, either alone or with Italian rye grass, this is undoubtedly the very best clover that can be grown. It is exceedingly productive, and cattle are very fond of it when young and green. The growth is very rapid, and on this account it is valuable for sowing on clover lays." The long heads or short spikes of crimson flowers are quite ornamental. The leaves are quite soft.

White Clover, or Dutch Clover.—Trifolium repens. This is a very prominent plant and probably well known by most readers of the Rural. It spreads very rapidly under favorable circumstances, so much so that some people think that plants spring up spontaneously, without seed, or that some other plant turns to clover. It is a low creeper, the leaf and flower stems rising from a few inches to a foot above the ground. It springs up and is usually very thick the first and second seasons on a lawn newly seeded on a heavy soil. It comes in on old roads where the soil is well packed. It is a fickle plant. It makes its appearance on sandy land when there is an abundance of rain early in the season. The hot weather comes, and the sun scorches the leaves and the flowers. The plants seem to vanish from sight and others take their places. It is perennial and one of our best honey-producing plants, but apiarists are unable to seed whole fields to the plant and keep others out. One by one the flowers, as they ripen, turn downwards at the top of the stem. There is a difference of opinion as to its real merits as food for cows, sheep and horses. Most farmers esteem it highly for permanent pastures. It is very nice for a lawn in damp weather, but the sun of summer kills the leaves and flowers.

Alsike Clover.—Trifolium hybridum. The specific name hybridum was applied because the species appeared to be intermediate between white clover and red clover. Botanists do not consider it a hybrid. I have twice tried to make crosses with this and white clover, but without success. I have never seen any plants which were intermediate between Alsike and white clover, though I have seen bees working on the flowers of each species where the plants were well mixed. If the plants can be crossed, we shall expect to see new hybrids. The stalks sometimes grow four to six feet in length, but they fall down and the leaves decay towards the base of the stems. The stems recline but do not take root like white clover. It is valuable for pasture and makes good hay, though its habit is not well adapted for meadows. Alsike clover is valuable for bees. In England, it is said to have been introduced from Sweden.

Yellow or Red Suckling Clover.—Trifolium minus. This is a small plant possessing some beauty, and is interesting on account of its near relationship to valuable clovers. In our garden it dies every winter.

Black Medick, Nonsuch.—Medicago lupulina. This is much like small yellow trefoil, and so far as leaves and stems are concerned, resembles white clover. The flowers are yellow; the fruit or pods are black and spirally curved. On good soil the plants furnish a great amount of pasture. It creeps along the ground and is not tall enough for mowing for hay.

Lucerne, Alfalfa, Purple Medick.—Medicago sativa. This somewhat resembles the red clover, only the stems branch less and are more erect. The leaflets are three, obovate-oblong and toothed. The flowers are purple and racemed. When young the herbage is succulent and relished by stock, but if left too long, it becomes woody and of little value. Lucerne can be cut two or three times a year, if grown on good land. It has become famous as a forage plant in California, Buenos Ayres and similar warm, dry climates where it is usually called Alfalfa. The roots become very strong and woody and run down to a great depth, thus accounting for the fact that the plant stands dry weather better than red clover. It is a perennial and in this respect better for permanent pasture than red clover. It has been cultivated in southern Europe for almost 2500 years, where it was introduced from Asia. It does not stand frost so well as clover. A deep, mellow subsoil is essential for the success of Lucerne. As the plant tillers less than red clover, about twice as much seed should be sown to the acre to produce the same effect as seeds of red clover. It should be cut as soon as the plant begins to flower.

THE WHITE PROLIFIC CORN.

PROFESSOR A. E. BLOUNT.

Now that a thorough test has been made of the White Prolific Corn, I mention a few items that may be of interest to the Rural readers—especially to those who gave it a trial. I am not at all surprised to see so many failures; but, as you intimated in the "Brevities" some weeks since, I am *indeed surprised* at the wonderful results that have been attained by some who have given it a trial. When you offered those liberal premiums I was fearful that most of the competitors would overdo, surfeit, and even destroy their crops by too liberal a supply of improper plant food, and unscientific culture. And has this not been the case in a number of instances? I notice many attribute their failure to make a premium crop, to that "old cow" and others to the naughty "wind;" while most adverse reports say, "the season is too short."

It could hardly be expected that seed raised on the 36th parallel and planted in May and June, would mature as high up as the 40th. I have many testimonials, however, stating that it fully matured in as high a latitude as the 42d. Judge Fullerton, of N. Y. City, writes "It fully ripened at Newburg—60 miles above this city;" and G. W. Bradly, of New Haven, Conn., states the same there. These men, as well as many others, whose letters I have on file, planted their seed early. I do not claim that it will ripen everywhere. When I com-

menced improving this corn, it required 156 days to mature it. It now ripens in 120, and some seasons in less. I am indeed glad that Dr. Chamberlin and the other prize-takers of the RURAL have made such large yields. They are much larger than I myself have ever been able to make. The fact is, the point I have had constantly in view was, not to make large yields on a given space with a certain quantity of seed, but the largest quantity on the single stalk and from the general crop, to improve the grain in quality, to lessen the cob, to make the stover less in proportion to the grain, and finer, to shorten the time of its maturity and adapt it to any climate and soil as well as to all localities.

In my endeavors to accomplish these things, I have made many notes, among which I find that in 1874 I shelled from the ears that grew on 631 of the best stalks selected from a measured acre, 784 pounds, or 14 bushels. In 1875, from picked stalks taken from an acre, I shelled 176 pounds, or 3 1-7 bushels. The largest yield of grain, the same year, from a single stalk, was 60⅛ ounces. All these experiments were made on upland clay soil without a single pound of any commercial fertilizer whatever. On each acre I put 20 two-horse loads of home-made compost, two years old, and nothing more. My general crop of 10 acres after 1874, never yielded less, on an average, than 70 bushels, and more than 96, at a cost of only 13 cents per bushel. My experimental grain cost 22 cents during four successive years.

I have no suggestions to make about fertilizers further than that composts made up of material to which corn—both grain and fodder—can be reduced in various ways, are best for it and will effect better results than the *intensive forcing system* many adopt in the use of highly concentrated fertilizers. Those soils that contain large deposits of alluvial matter—such as are found on river bottoms and prairie lands—have a tendency to make corn sucker. The fact is, such soils give corn an overdose of stalk food and sacrifice the grain. Upland soils are better for wheat as well as corn so far as the making of grain is concerned, unless the farmer can apply some neutralizing elements to reduce the alluvial. Dr. Chamberlin was right in removing the suckers, and I hope he and all corn raisers will do the same until they are able to dilute their fertilizers sufficiently so that the suckers will not appear. I have been improving this corn for over nine years, and it has never borne a sucker over a foot high until this season, when I planted on prairie soil. I have been planting it on upland soils with clay subsoil in hills 3x4 feet, leaving but one stalk in the hill, and always using level culture. I hope those who wish to keep this corn for their field crop will take a little pains to keep up its standard. Like all corn and other improved seed, it will degenerate or relapse and in a few years the fodder will be as coarse, the stalks as sterile or infertile and the period of its maturity as long as when I commenced improving it.

The top ear only of those stalks that ripen first and are most uniform, should be used for seed. These should always be selected in the field before the crop is ripe, and cut and shocked alone, when the husk is fairly dead and the grain well glazed. To keep my seed genuine and free from being impregnated by the pollen of foreign varieties and sterile stalks, I cover with muslin 200 or 300 ears, just before they silk, and when the tassel and silks are ready, I remove the muslin, put the pollen of the selected stalks upon the silks and re-cover them. This insures genuine seed, a fully developed ear in every case and much better grain.

Agricultural College, Fort Collins, Col.

THE COW PEA IN TENNESSEE.

THIS is a valuable crop for hogs and all other kinds of stock, also for hay or soiling and enriching worn lands. I heartily indorse what our North Carolina friends say of it. For years it has been called "the clover of the South." In West Tennessee it grows to perfection. We could not well get along without it. Nothing else that causes so little trouble or expense is so profitable. All our best farmers plant at least as many hills of peas as of corn. Sown broadcast after wheat harvest—with us from 1st to middle of June—tons of pea-vine hay are made, equal if not superior to clover hay. Cow peas will grow where no other crop can be raised to profit, and they are one of the best fertilizers and the cheapest we know of. They may be grown with corn—they generally are with us—planted in the drill, or about the last plowing, between the rows, and they are often sown broadcast when laying by the corn. On good land and in a favorable season the peas are almost equal in value to the corn crop. Stock are turned on the land as soon as the corn is gathered—very frequently before we have frost to damage the vines. Enough seed for planting is picked when ripe—say one bushel for six acres in the hill, or about two to three bushels per acre if sown broadcast. In this cotton region farmers neglect saving seed sometimes, and the demand is greater than the supply. Seed is generally worth in the market here from $1 to $2 per bushel. We grow mainly the Black Running, a late and profitable variety which keeps well, but is objectionable as it pulls down the corn, running to the top of the stalks and down again, completely matting the ground. We also have a black pea, like the "Claybank," which runs very little in ordinary seasons and on thin land. The speckled, or Whip-Poor-Will, is the earliest. Two crops may be raised in one season if planted in May or June. The above are all valuable varieties and will keep until eaten up by stock. Hogs generally are fattened on peas, with very little corn for a few weeks to improve the pork before killing time.

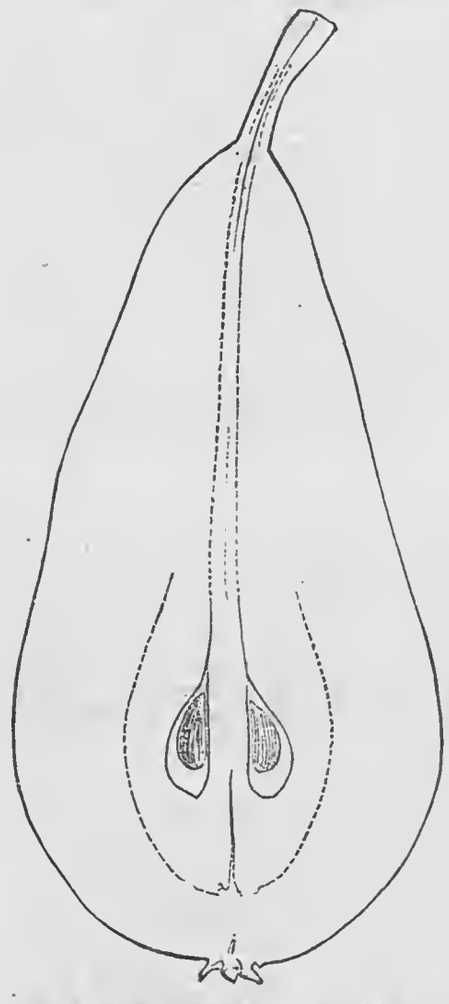
Pomological.

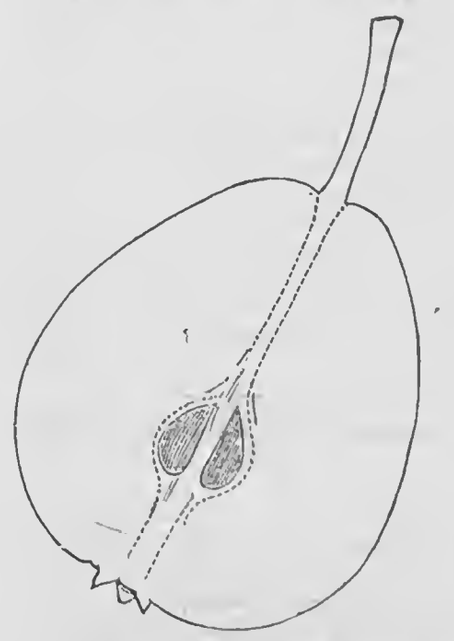
INFLUENCE OF THE STOCK UPON THE GRAFT.

ALL pomologists are agreed that frequently the stock exerts an influence upon the graft, which tends to vary its habit of growth, as well as the size, color and quality of the fruit. It is, indeed, upon this principle of variation that the Paradise stock is chosen for the Apple, and the Quince stock for the Pear when these are desired to produce a dwarfed growth.



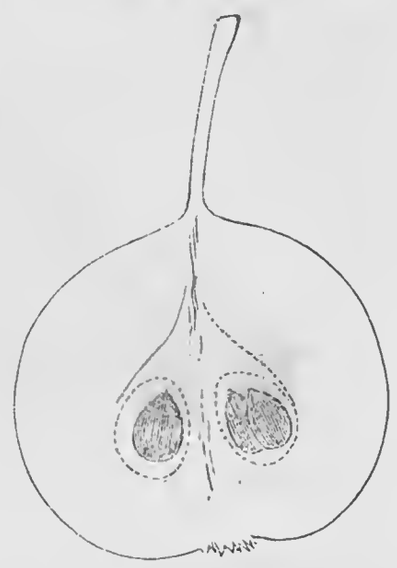
BEURRE CLAIRGEAU.—FIG. 73.

The limits of this influence are undetermined, at least as far as the quality of the fruit is concerned. Nor is it known with certainty what is the real cause or why some stocks influence the graft more than others, or what causes this influence to be more strongly marked in some cases than in others in the same varieties. But it is supposed that plants to a certain extent conform to the same laws that govern progeniture in the breeding of animals; the more fixed a species or variety has become by being propagated in a direct line for a long time, the greater will be its power to stamp its characteristics upon other and less fixed varieties when united with them, whether



GRAFT HYBRID.—FIG. 74.

the union takes place by grafting or through the more intimate connection of fertilization. We present here a very marked and curious instance of the influence of the stock upon the graft, the illustrations of which have been redrawn from the Gardeners' Chronicle. A young tree of the Aston Town Pear which proved unproductive, was cut back and grafted with clons from Beurrè Clairgeau. In due time the graft fruited, but the fruit was neither like Aston Town nor Beurré Clairgeau but intermediate between the two, as shown in figure 74. A twig of the Aston Town stock bore fruit the outline of which is seen in figure 75 a Beurre Clairgeau of the tree from which the



ASTON TOWN.—FIG. 75.

cion was taken is represented in figure 73. The graft hybrid possesses as much of the characteristics belonging to the stock as those of peculiar to the graft, or more, and the variation extends even to the form of the seeds.

Entomological.

BARK LICE AND KEROSENE.

G. H. FRENCH.

As the expediency of using kerosene to destroy insects on growing plants is by many a doubtful one, I wish to give here some of my experience and the conclusions I would draw from that experience. Among my house plants, I have had for several years a semi-shrubby plant known here as Ladder Fern, but which, I think, is a species of Phyllodium. During the summer of 1878 it was, with others, set out in the yard where it became covered with bark lice—a species of either Lecanium or Coccus. When taken into the house, soap suds and carbolic acid solution and hand picking were resorted to, but the only effect was to lessen the numbers, coming far short of extermination. Last summer the plant was again transferred to the yard, so weakened by the lice that but few leaves remained, the principal office of the leaves being performed by the broad green stems. While in this condition, I sprinkled it on an average of twice a week for a few weeks with water into which I had poured a teaspoonful or more of kerosene. As a result of this I noticed that all the lice on the tops of the stems and leaves, or wherever the kerosene touched them, were dead, and the plant putting out new leaves. Where the mixture had not touched, there were yet plenty of lice and upon stopping the application they began to spread. I next took a small brush, such as is used in marking freight, and painted the under side of several of the broad stems and one of the several main stalks with clear kerosene. I did not know but this would kill the plant, but it only killed the bugs, leaving the plant after a few days to grow more vigorously. By these applications I succeeded, as I thought, in killing all the lice before it was time to transfer the plant to the house in the fall, but after a few weeks I noticed there were still a few left. My next experiment was to fill a vessel with water and pour on kerosene enough to make a complete covering over the top. Taking the part containing the plant, I turned it bottom-side-up and completely immersed the top in this preparation, leaving, when I took it out, a film of kerosene over the whole plant as well as much running down the stalks upon the upper part of the roots. This checked the growth of the plant for several weeks, indeed was a severe test of the effects of kerosene on vegetation, but it killed all the lice and the plant is now growing again.

At the same time that I treated the Phyllodium to the kerosene bath, I had a Cape Ivy, a variety of the German Ivy, that had a few green aphides on the growing end. I immersed the end of this, far enough down to include all the part covered with lice. It checked the growth for a couple of weeks perhaps, but did not kill the young leaves that were just coming out, as they expanded with others when the plant resumed its growth. In making the above experiments I had two objects in view—to kill the lice and to see just how the kerosene affected the plants. That it will kill plant lice wherever it can be applied to them, there is no doubt, whether it be the bark lice or the aphides or those that make galls in the leaves. I think from my experiments I am safe in assuming that a moderate application, such as sprinkling with a mixture of kerosene and water, will not kill even our tender house plants, though I would not recommend in such cases the heroic treatment I gave my Phyllodium. In the case of bark lice on trees, such as infest our fruit trees and perhaps our Maples, I think the application of kerosene would be of great advantage, but the mode of application should depend upon where it is to be applied. If to the tender leaves, then it should be mixed with water and some form of sprinkler be used; for covering the surface of a growing leaf checks for a time the growth of that part of the plant, probably because of stopping the pores and thereby stopping respiration. If, however, the wish is to destroy bark lice on the limbs or body, I believe it will do to take a brush and paint the parts with the kerosene, and my experience leads me to conclude that it will penetrate the hard case of the females and kill all eggs and young underneath. I am aware that to old, large apple trees it would be difficult to follow my suggestions on any part but the trunks, and there little if any damage will be done, but I have seen a great many young trees killed by bark lice, which I think would have made fine, thrifty trees if some such remedy as this had been applied, something that would not take the farmer as long to apply as it did to set out the trees.

Jackson Co., Ill.

Trapping the Codling-Moth.

Last season I used bands upon my apple trees to trap the codling-moth, and the result was nineteen larvæ were caught from 75 trees, in the course of the summer. Cotton flannel was used—strips about four inches wide folded once, making them two inches wide when on the trees, with the rough edges downward, and the soft side next to the bark, put on rather loose. Will some one tell me what was the cause of my failure? The apples were usually wormy, but my loss in this direction has never been very severe. These bands are so often recommended, and by eminent orchardists, that my failure was a surprise as well as a great disappointment,

I had about one hundred hens running in my orchard during the season, and am confident that they destroyed more codling-moths than were captured by the bands. My trees have been thoroughly "scraped" every winter for several years, and, in my opinion, with beneficial results. NELSON RITTER.

[We are far from wishing to throw cold water upon any method of detroying insects, that promises to be practicable. But as remarked in these columns before, we believe that it will be found that the above method of destroying the codling-moth will never prove effectual and that in any case it costs more, in time and trouble than it is worth.—EDS.]

Farm Economy.

DEVICES FOR EVAPORATING FRUIT.

VARIOUS methods and devices for evaporating fruit have been employed, all having one common object—to remove the natural juices in the shortest possible time, so as to prevent surface decomposition and consequent decolorization, which can be removed only by the use of sulphurous acid or chlorine. To effect this object, all the principal evaporators have adopted one or other of the following four principles:—

1. The first method introduces the fruit into a humid atmosphere at the top of a vertical hot-air chamber, and, as it becomes heated, causes it to descend by machinery a few inches at a time, until it reaches the heating apparatus at the bottom of the trunk or chamber. Every time one hurdle is lowered, another is introduced above it, and so on until it comes out at the bottom dried. This is not philosophical evaporation.

2. A second method is to lay the fruit on endless, horizontal or inclined carriers. The heat is applied when the fruit is introduced, while a blower is stationed at the other or "wrong" end. This device, as might have been expected by a philosophical mind, has not been a great success, nor has it become a favorite.

3. The third device starts philosophically, but ends in an unphilosophical manner. The fruit is introduced, immediately over the heating apparatus, into a vertical hot-air chamber from twelve to thirty feet high, and going up one side of the chamber returns on the other back to the place where it was introduced, the trays all the time maintaining their horizontal position on the principle of the revolving swing. This is convenient.

4. In the fourth and last device, the fruit is introduced, immediately over the heat, into a vertical hot-air chamber of greater or less hight, and is taken out at the top. While this device is not as convenient as the last to operate, it is more philosophical and if neither used sulphur or chlorine for bleaching, it would make lighter-colored fruit in the same

time, with far less attention and less risk o scorching. Having no interests but truth and the best welfare of fruit growers in general to subserve, I wish to give each contrivance its exact due. Any device for fruit evaporation needs to keep in view several important points: 1. The shortest possible time in removing natural juices to prevent surface oxidation or decay. 2. The absolute necessity that the fruit be kept in a moist atmosphere until the natural juices are expelled, or until only about twelve per cent. of the natural juices remains. The fruit should be kept in this moist atmosphere until it is removed from the evaporating chamber. 3. A strong current of air entering at the bottom of the chamber and passing off at the top, being forced through the fruit as it lies on the hurdles or trays. Hot air in motion in a moist atmosphere, is the true secret of philosophical evaporation. Wherever this is secured, there is a philosophical evaporator, and no where else. An oven or kiln simply dries fruit, but does not evaporate it. In drying fruit the surface is dried, while the interior remains moist, and as soon as the surface is dried, the chemical action of converting the starchy into saccharine matter ceases, while so long as the surface is kept moist and the natural moisture is being rapidly removed, this chemical change goes on the more rapidly as the heat and the moisture increase, so that philosophically evaporated fruit contains from five to fifteen per cent more glucose and often chrystalized grape sugar, than sun or oven-dried fruit, where no sulphurous acid is used in bleaching. When bleached with sulphur, the amount of sugar is somewhat lessened.

The perfection of an evaporator, as regards its philosophy and convenience in operating, would be a sort of endless chain, like the third device alluded to in this article. The fruit should be carried up in the hot-air chamber filled with moisture, fanned by a strong current of air which passes out at an opening in the top, saturated with the moisture extracted from the fruit. The latter, when the natural juices are expelled, should return in a tight cold-air chamber so as to be taken out at the bottom, and immediately put up in hermetically sealed packages. All danger of scorching is thus avoided, as fruit can never be scorched in moisture-saturated, heated air, unless the temperature is raised beyond any probable limits. The danger of over-drying is also avoided by removing the natural juices in moist air. The fruit is taken out when it feels quite moist to the hand, but before it can be removed from the hurdles it rattles from dryness. And yet, as has been repeatedly proved by analysis, there remains only about 12 per cent. of moisture; whereas, sun-dried or kiln-dried fruit may appear hard and dry, yet the analysis shows from 16 to 24 per cent. of water in it, the outside being hard, but the inside soft. Evaporated fruit is of uniform moisture. S.

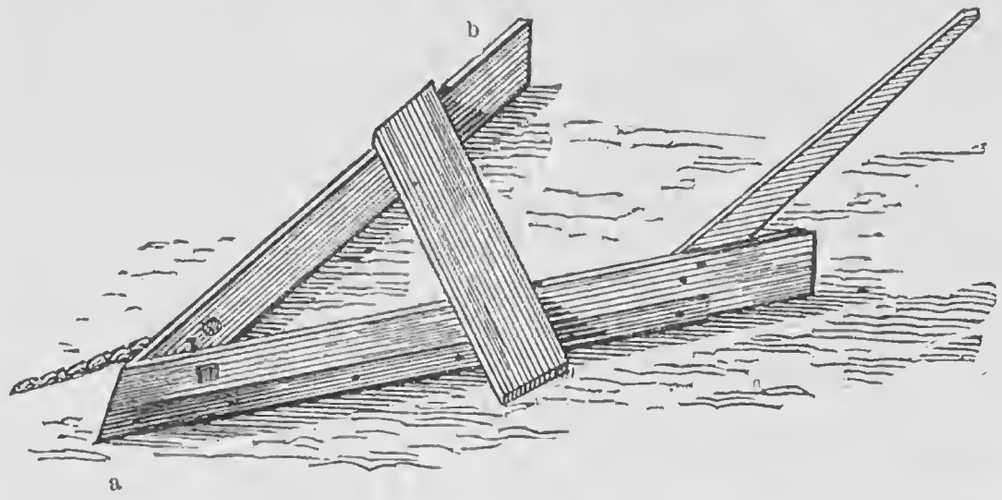
ROAD AND DITCH SCRAPER.

The cut shows an implement used for leveling roads and scraping out ditches. The team being hitched to the chain, the side—a—is drawn straight ahead and holds the scraper in place, while the side—b—in hard ground, cuts off the high places, fills the holes and throws some dirt away from the scraper.

In leveling roads the scraper is drawn down one side of the road with the plank—a—next to the gutter, and back on the opposite side, leveling a strip on either side five feet in width, leaving a ridge of earth at the inner side of each strip. It is then drawn around again so that the point will run just outside of the ridge left the first time, and so on till the whole road is gone over and the earth gathered and thrown to the center, when the road will be left highest at the middle, causing water to run off quickly. This scraper does excellent work in filling up ruts and holes, and would pay for its cost in one year in any road district.

The graveled roads or drives on the college grounds, nearly two miles in length, are kept in order almost entirely with one of these scrapers. It is run over the drives after a rain or whenever the weeds start, and keeps these down and the roads hard and smooth. For ditching, from where the ditch is wanted three or four furrows are turned out each way with a plow; then running the scraper through and back will throw out the loose dirt down to the bottom of the furrows. By repeatedly plowing and scraping, a ditch two or three feet deep may be worked out without any hand-digging, and the dirt may be thrown back a rod on either side, if desired, so that a wagon or a mowing machine will run over anywhere. In putting in tile drains, I have done more than half the excavating, and all the filling after the tiles were laid, except the first five or six inches, with a plow and this scraper.

The sides are of 2x12-inch plank, eight and ten feet in length, the front ends beveled and bolted together, and the back ends spread to cover five feet. The bottoms of both sides should be shod with a steel band 3-16x3 or four inches in width as shown in the cut, fastened on with rivet-headed bolts, counter-sunk, to prevent catching or holding dirt. Where they can be procured, old saw-mill saws are very good for this purpose. The steel bands should project half an inch lower than the planks to prevent slipping. The chain is fastened about 18 inches from the point. The driver stands



ROAD AND DITCH SCRAPER.—FIG. 76.

on the cross-piece and by shifting his position, can change the angle of draft. For nice work, trimming borders, etc., it needs another man to guide the scraper by the handle behind.

Agr'l. Coll., Lansing, Mich.

Dairy Husbandry.

THE CENTRIFUGAL CREAMER.

RICHARD GOODMAN, JR.

This machine promises to improve our butter in two ways: the separation of the cream in twenty minutes from the milking reduces to a minimum the danger of injury from outside odors and internal decomposition, and the necessary cost of the machine and of the power to run it being too great for small dairies, will increase the number of factories.

It would be difficult to over-estimate the immense value of this escape from all systems of "setting." We save the expense of a milk-room, pan-room, stove to heat and ice and water to cool, and have all at once become nearly independent of heat, cold, dryness, dampness, dust, odors, insects and decay.

But the cream and skim-milk obtained by this machine are not only better, because nothing foul has got into them, but in every case, and from the milk of the most carefully kept dairies this separator is sure to remove a considerable quantity of offensive greenish matter, which even the healthiest cow deposits in her milk while yet in the body and bag. We have, then, from this separator, cream which may be said to be both negatively and positively purer than that obtained by the methods of setting.

It would also seem to be true that a larger quantity of butter is made from "separated" cream than from "set" cream. The Germans, Mr. Burnett says, have, with their repeated experiments, invariably found a gain of from three to six per cent. The cream from the separator churned in 17 minutes, while that from deep, cold setting required 53 minutes. This was in Mr. Burnett's dairy, and it is in Mr. Burnett's address before the American Dairymen's Association that we have the most valuable contribution to the literature of this subject, which has yet been made. Dr. Sturtevant reports that the butter made from the "machine" cream is distinguished for its absolute purity and its firm grain. Contrary to expectation, it appeared that the great centrifugal pressure had not ruptured any of the globules.

This outward pressure, when the machine is revolving rapidly, is very great. At 2,000 revolutions to the minute the pressure is over 200 pounds to the square inch. Hence it would seem probable that the expense of making a machine which will endure such rapidity of motion and intensity of outward pressure will, always be very considerable. The motive power will also be a large item. From this it would seem probable that this centrifugal creamer will not be available for small dairies, but just in the same ratio will it become the most desirable mode of cream raising in the larger dairies and in butter factories. And just as fast as butter-making is taken out of the hands of the farmers' wives and out of the farmers' dwellings, and put into the hands of men and women and into buildings devoted entirely to this one purpose, just so rapidly will the quality and uniformity of the butter product of the country improve.

I do not mean to say that "the best butter" cannot be made by the farmer's wife in the intervals of her other domestic labors, and in the old-fashioned milk-room or spring-house, and by the old-fashioned methods of setting; but there is little profit in butter so produced, little certainty of its being uniformly good, and much anxiety all the time. For the profitable and regular production of the best butter, it would seem that the centrifugal creamer is already one of the prime necessities. The sweetness and purity of the cream and skim-milk produced by this machine add largely to the value of this method of separation for factories and dairies situated near cities, where sweet cream and sweet skim-milk are in demand; the consumption of these two articles is large to-day and is steadily increasing, and may, at no distant day, be in itself sufficient for the employment of many creamers.

Yokun Farm, Lenox, Mass.

WHITMAN AND BURRELL'S CENTRIFUGAL CREAMER.

While on a late visit to the central part of the State, I took particular pains to look into the success or failure, whichever it might be, of the Messrs. Whitman and Burrell's experience with the machine they took with them from the International Dairy Fair to experiment with. I found these gentlemen quite sanguine of its ultimate success, but they thought they had suggested some improvements that could be made in the machine. The owner, therefore, took it back East with him, and it is supposed he is now embodying in it the suggestions of Messrs. Whitman & Burrell. The present machine costs $500 and only separates at the rate of one hundred gallons an hour. This work is hardly rapid enough for a paying basis, so Mr. Burrell has suggested that a deeper cylinder be made for holding the milk.

There is also a very serious objection in the difficulty of cleaning the present machine, owing to its elaborate and covered mechanism. This it is proposed to remedy by removing the cover altogether, which can be done by raising the sides of the cylinder so high that the milk will not fly out. All parts of the machine can then be easily reached for cleaning. It was also thought that the price, owing to the simplifying of the machine, could be lowered, so that more than one machine could be used in a factory. I could not find that any elaborate experiments or extended use of the machine had been made, though it was run for a while in the city of Syracuse while the American Dairymen's Convention was held there, for the purpose of showing visitors this new method of separating cream from milk.

In this connection it may be well to add that in a note received from Mr. F. B. Thurber, the other day, he called my attention to the necessity of warning the dairymen to be on their guard as to the quality of the cream from these centrifugal machines for butter making, and inclosed a letter to him from Mr. Thomas Nuttall, of London, concerning the test trial made at the last London Dairy Show between this machine and shallow setting. I quote from Mr. Nuttall's letter:

"The exact figures of the analyses by Prof. Voelcker I have mislaid, but I have written for them again, and will let you have them. But the milk that had passed through the separator contained the most fatty matter, and proved that the cream globules had been so broken into the watery part that they would not again collect by standing, and so were practically lost for butter purposes."

This is simply put forth as a warning, and may be a fault confined solely to the machine tested in England, but the matter should be carefully investigated in this country before all doubts of the practicability of the machine are removed. L. S. HARDIN.

THE FAIRLAMB SYSTEM OF GATHERING CREAM.

In the RURAL of January 24th G. E. N. asks, "Of two patrons of a creamery, if one brings richer milk than the other, does he get a larger proportion of the butter made?" In your answer you say, "No; all patrons of a creamery or cheese factory share in the aggregate product in proportion to the quantity and not the quality of their milk. It isn't exactly just, but where is the remedy?"

It is of the remedy that I wish to speak; for there is a remedy, and so far as it has been tried, it works entirely satisfactorily. There has been more or less grumbling and faultfinding among patrons of creameries, and in many cases very justly, too, because one patron took better care of his cows, fed them better and on richer food, and, as a result, produced richer milk, but received no more per hundred than his neighbors whose cows were poor and half-fed. There is no question but the one who produces the best milk contributes to the share of the patron whose cows are half-fed and poorly taken care of. The question how all this could be remedied and every one get just what belongs to him and no more, has perplexed many a wise head for years.

The system which is known in Illinois and Wisconsin as the "Fairlamb System of Gathering Cream" has solved this whole question, and it is so simple it is the wonder that some one never thought of it before. The can which is used is made smaller at the bottom than at the top; is about twenty inches high, with a tube in the center for cooling the milk. The air-tight cover is put on after the milk is cool. The glass gauge on the side of the can shows the number of inches of cream to be taken off. The milk is set at home, and the team from the creamery calls every day for the cream. The graduated glass gauge on the side of the can shows the number of inches of cream to be taken off, and this is set down in the patron's book. At the end of every month the number of inches of cream is figured up, and the patron paid so much per inch, or he allows the factory so much per pound for making, each inch of cream making a pound of butter. For half a day or more, cream is gathered from the patrons before the team returns to the creamery, each one getting just what he produces and no more.

This plan of running creameries has been tried the past year, and many more will follow the coming season. So far it has worked well, giving the best satisfaction. Cream has been carried twenty and thirty miles without ice during the hot weather, and the butter sold in New York at a price equal to that of the best creamery. D. W. C.

Sheep Husbandry.

CARPET WOOLS—THE SHEEP REQUIRED.

COL. F. D. CURTIS.

In former articles we have pointed out the profits which might be expected from a flock of combing-wooled sheep, and suggested to dairymen the advantage of exchanging cows for sheep of this kind in order to relieve one industry over-worked and to build up one scarcely begun. Combing wools are almost entirely imported, and this fact leaves a field open for occupation for all those who are willing to comple with a small investment for stock, painstaking and skill in the management of a flock of such sheep. When this shall be done, there is no class of sheep which will afford more income than they. They will require housing in this climate during all severe and inclement weather, to preserve the rich luster which is essential with a fine class of combing wool, and also liberal feeding to make the length of staple as well as luster. Housing, or protection, does not make the luster but preserves it.

There is another class of wool of long staple which can be produced without so much extra feeding and trouble, to wit, the carpet wools. The Mexican sheep of the Southwest are the basis of this staple, and from the pastoral regions of the Southwest the home supply of carpet wools is mostly derived. These native sheep roam in large flocks over the plains of southern Colorado, New Mexico and Texas. The cost of producing this wool is very small, and the freighting is also light, as it is done by Mexicans with ox teams, several wagons being hitched together and the whole drawn by several yoke which subsist on the grass found along the way, the drivers camping alongside. Fifty cents a hundred is the usual price for hauling freight in this way for a hundred miles or more. So little developed and utilized is this vast region that it is able to furnish but a small portion of the wool required for manufacture into carpets in this country. The millions of pounds which might be produced are now brought from South America and Australia, but principally from Africa. The Cape of Good Hope is the chief competitor with the Southwest in the production of carpet wools. These wools are so low-priced that the protective duties on them are the least of any wools brought into this country. They can be produced in the United States cheaper than any other wools. A long, tough staple is required for carpets. Harshness and coarseness of texture are not objectionable in carpet work, but such wools are scarcely adapted for anything else except rough blankets.

In order to get the long staple required for their work, our carpet manufacturers are obliged to select their wool from almost every wool-producing country in the world. Russia furnishes considerable and so does Asia Minor.

Every pound of carpet wool could be produced in our own country. There are vast districts in the Southern States not now utilized which are capable of feeding millions of sheep. The yield of wool per head may be increased by crossing the Mexican sheep with the Cotswold. The former are light shearers, not averaging more than three pounds, probably less. Each cross is good for an extra pound of wool, and the cross-bred sheep are said to adapt themselves to the fare and habits of the natives without much detriment. We would not advise more than two crosses, which would change the natives to three-quarters Cotswold. The Cotswold is a sheep of very different form from the Mexican, as the latter are more leggy and much lighter in the quarters, thinner on the backs and not generally so muscular or inclined to fat. The natives live a nomadic life, and their form of body is the outgrowth of it, while the Cotswold shape or coulour is a form molded by quiet. These opposites cannot be blended to the extinction of either extreme without changing the nature and characteristics of one or the other breed. Where the new animal must follow the same habits of life as one of the originals, it must conform to the type of the one it supplants, or it will be a failure A Merino sheep graded up to a Cotswold will be ill adapted to follow the nomadic and uncertain life which seems so natural to the semi-wild sheep of the Southwest. Crossing with the Mexican would thicken the fleeces of these long and loose-wooled sheep, but it would at the same time change its character from coarse to medium, and it would no longer be carpet wool, as it would lack the length of staple which adapts it to the purpose. We should like to see every carpet-loom in America supplied with wool of our own raising. This would cover the plains with flocks and give employment to thousands who are now idle, and place our manufacturers beyond the risks of foreign contingencies. Unpeopled regions would be busy with the evidences of life and thrift, and the income of the country would be largely augmented.

These coarse and light-wooled sheep are not suited to the changing and severe climate of the North; but are the best adapted to regions where the seasons vary but little, and extremes of heat and cold do not occur. They will do better on coarser feed than the Merinos or their grades, and on this account are better fitted for the wild grasses of the prairie and all uncultivated lands. For such pasturage they should be graded with the Cotswolds, as they too will bear coarser feed than the fine-wooled breeds. The lambs will be stronger, and the loss much less than with the latter. They are larger milkers and will nourish their young better under rough treatment. The raising of the young is as important in the year's income as the wool. Where the winters are trying and the herbage is finer and shorter, grading with Merinos is the best, as they will be less liable to disease, their close fleeces shutting out both wind and storm in a much more effectual manner. Merinos never do well in low, damp lands; but have a natural fitness for upland and mountains, while Cotswolds do best in valleys.

SHEEP NOTES.

I HAVE just looked over Mr. Blackwell's article, page 87, of the RURAL. It is a good one on the whole, but it is not exactly the thing to recommend South Downs to be crossed on Oxfords. I fancy he does not know how the Oxfords were made. It was chiefly by crossing Cotswold rams on various Down sheep, then selecting the best of these, and breeding them together till they assumed a fixed type. It took 30 years or more of great care and pains to do this. Our people seem to know little of the formation and history of this splendid breed. When in England in 1841, I traveled all over the South Down country, sometimes in a carriage, but more often on a horseback and on foot, mingling among the farmers and most celebrated of the sheep masters. I there saw thousands of such crosses, from which subsequent selections were made to form the Oxfords. These at that time were merely bred for early lambs and wethers for mutton, etc.

Sheep farming on the English Downs is the most beautiful, and at the same time one of the most profitable systems of farming in England. It is the best system for growing wheat on the four-course shift practiced there; also other grain, etc., etc.

Mr. Blackwell speaks of Leicesters, etc. Now, all such, except the hind legs of their carcasses, are too fat for eating—great masses of *mutton tallow*—and in England they are salted down as hogs are here, and the mutton is called the "*the poor man's pork*," in derision, and the poor only eat it, because they cannot afford anything better. These Leicester rams, etc., produce a fair quality of mutton by crossing on our thin grade Merino and other native ewes. But the first cross is the best; a second, or, at least, a third, gives too fat and coarse an animal. Very few of our farmers understand this. I began to ship these long wooled rams to the South nearly 40 years ago, and have kept it up ever since, to fill orders from my friends there to cross on their poor, thin, native ewes. They like the first cross much; also, that of South Down rams which I have sent. A SUBSCRIBER.

Miscellaneous.

WHAT OTHERS SAY.

ARTIFICIAL FERTILIZERS.—A writer in the N. Y. Times gives his experience as follows: "A second year's experience with artificial fertilizers confirms my previous opinion of their value. As a help to fill out the supply of manure, of which no good farmer ever yet had enough, they are invaluable and indispensable. The great advantage is their quick action; 300 pounds per acre of Mapes's Complete Manures, A brand, spread over a field of oats, was rained upon at night when the work was but half finished. Before the next evening the part first covered was conspicuously greener than the other part, showing that in 24 hours the effect of the fertilizer was already in action. The permanence of these fertilizers has been much questioned; but there seems to be no doubt of it. One of my fields of fodder rye, which was in potatoes in 1878, and was then dressed with no manure but the potato fertilizer at the rate of 600 pounds per acre, was put in rye the same fall; the rye was cut for fodder the next spring, and the land was sown to Hungarian grass. Both these crops were unusually good. A part of the rye was cut twice, and a part, left for seed produced good plump grain. The field is sown to rye again, without any manure or fertilizer, and looks remarkably well, and quite equal to another field on which 20 loads per acre of rich cow manure were spread. The effects of the fertilizer are clearly not exhausted by three crops, and show favorably on the fourth.

LIBERAL FERTILIZING.

"The liberal soul shall be fat." This applies in a remarkable degree to the fertilizing of one's fields. Up to a certain point, each additional dollar's worth of manure is returned with profit varying from 100 to 200 per cent. But while there is a point beyond which manuring will not pay, there is also one below which it is equally unprofitable. Each one must find this limit for himself. On my soil, which is a light sandy loam, deep, mellow, and warm, and one that does not readily dry out, 200 pounds of artificial fertilizer, or 10 loads of manure per acre, make but very little show; but 600 pounds of fertilizer per acre has paid for itself three times over. A friend who farms a clay soil in Western New York writes me that 500 pounds per acre is the most profitable quantity he can use; more than that is in excess of the capacity of the crop to use, and less is not enough. This is an important point, and is akin to the feeding of an animal; overfeeding is waste, and under-feeding does not supply the actual natural wants of the animal growth.

EARLY AMBER CANE.—Seeing so much on the cane-growing industry in your paper, I send you the following notes from this section: The farmers here are fast finding out that it pays to raise their own "sweetening," and that the "Early Amber" is the best variety of cane for that purpose, as it makes a sirup equal in taste and looks to the best "sugar drips," and has the advantage of known purity. It finds a ready market at 75 cents per gallon, while common sorghum is a drug at 40 cents. It also matures early, and thus need not be planted as soon, and also gets out of the way of the early frosts; and even now, where they have the machinery, they are making a No. 1 article of sugar from its sirup. If any of the readers of the Inter-Ocean should wish to investigate its merits, and will send stamps to pay return postage and expense of mailing, remembering that postage is one cent an ounce, I will send them seed, warranted pure. Address F. Wilkinson, Avon, Fulton County, Ill. —Chicago Inter-Ocean.

[If Mr. Wilkinson proposes to send these seeds, as his offer implies, "at *cost* of postage and expense of mailing," we fear he will have occasion a hundred times over to regret it. Inexperienced persons can have no idea of the avalanche of applications such offers to widely circulated journals will bring upon them, and the Inter-Ocean ranks, in point of circulation, among the first journals of this country.—EDS.]

ABOUT SEEDS.—Mr. Joseph Harris in his catalogue just received, says: "Last year and the year previous I selected the largest, finest, and best heads of cabbage for seed. The cabbages that I saved for seed would have sold for more money than the seed raised from them would sell for at wholesale. And such really splendid and exceedingly costly and reliable seed will not be as plump and bright and probably not germinate as freely as the seed raised from inferior cabbage of the same variety. You can raise common scrub cattle more abundantly than you can Duchess Short-horns, and you can raise more plants from an ounce of *poor* cabbage, onion, lettuce, carrot, parsnip and beet seed than you can from an ounce of the best and choicest and really *most valuable seed*. If you buy *good* seed, sow it thicker than you would common seed. The cost of seeds is so slight compared with the pleasure and profit of having a good garden, and also as compared with the cost of preparing and enriching the land and the cost of cultivation, that it is poor policy not only to sow poor, cheap seeds, but to sow them so sparingly as to run the risk of not having plants enough to fully occupy the ground."

"WOMAN CAN DO a great many things and do them better than can a man," says Mr. Hyde, in the N. Y. Times; "but she never was made to run a farm. She has various and increasing rights, but following the plow, driving oxen, managing bulls and breaking colts are not among them. She is an indispensable helpmeet to the farmer, but her sphere is a domestic one, literally domestic, that is, belonging to the house. When she takes upon herself the prerogative of mingling with the men in the field, loading hay and moving it away, directing about the breeding of stock, and displaying her equestrian skill on the road or race-course, she unsexes herself and becomes a man in petticoats. . . . When we find that a young farmer has secured a wife, and treats her as a partner in his business, we feel far more confidence in his success than when he is backed up by a rich father or a large capital, and we are confident that many of the mistakes which we have known farmers to make would have been avoided if they had taken their wives into their counsels. There is no henpecking in this; it is the part of wisdom, and whatever is wisdom's part is true manhood."

THE VALUE OF MILK.—"All things considered" says Professor Sheldon in "Dairy Farming," "good milk is the cheapest kind of food that we have; for 3 pints of it, weighing 3¾ pounds, and costing 4½d., contain as much nutriment as 1 pound of beef, which costs 9d. There is no loss in cooking the milk, as there is in cooking beef, and there is no bone in it that cannot be eaten; it is simple, palatable, nutritious, healthful, cheap and always ready for use with or without preparation. . This is to say that, chemically, 3.7 pounds of milk is the equivalent of 1 pound of beef in flesh-forming or nitrogenous constituents; and 3.17 pounds of milk is the equivalent of 1 pound of beef in heat-producing elements or carbo-hydrates. . . . We must, therefore, assume, from the data offered, that the relative values of beef and milk as human food are as 3½ to 11½, or as (in round numbers) 1 to 3½."

COW PEAS.—"The yield this way (Tennessee) is from 15 to 30 bushels per acre, according to land," says a writer in the Country Gentleman. "The yield in hay is from 3 to 4 tons, also according to land. A neighbor has raised five wheat crops one year after another on seven acres of what was poor land when he began with it, and the two last crops made 16 to 20 bushels per acre. The first crop on this land was 5 bushels to the acre. When he cuts his wheat he places his shocks in a line, then immediately plows his land and plants the peas. He cuts them in August or turns them under, and in October re-plows and plants wheat. The work stock needs corn while being fed the hay, but idle horses or mules need no other food during winter."

UPLAND WATER CRESSES.—E. B. H., gives his experience in Vick's Monthly as follows:—"Seed sown early in spring, 1876; ground four feet by eight; north side of brick wall; came up thick, grew well; watered well in dry, hot weather; used early in the fall following; continued until August, 1879, thrifty and good; then it was neglected for watering, and partly died out. It was pronounced, when growing, by an Englishman used to it, as quite equal to that grown in water. I used it myself all the time, morning, noon and night, and say that it ought to be cultivated by all who like such stuff. I recommend to all persons wanting a good stomach, to try its cultivation."

"BLACK MEXICAN" SWEET CORN.—Mr. J. A. Woodward, the experienced agricultural editor of the Center Democrat (Bellefonte, Pa.), thus supports our opinion of this corn: "In the RURAL NEW-YORKER for January 24, we find a high opinion of this most delicious of all the varieties of sweet corn with which we are acquainted. Like the RURAL, we have tested all the leading varieties, but for ten years past we have not failed to have a small lot of "Black Mexican" for our own table use. In point of productiveness we do not think it equals some others, but in quality we do not hesitate to second our valued contemporary in placing it at the head of the list."

EX-GOV. FURNAS.—The Nebraska Farmer which, by the way, is a credit to that State, says: "THE RURAL NEW-YORKER, in its issue of January 10th, has a very fine portrait of ex-Gov. Furnas, followed by quite a lengthy biography. As Gov. Furnas is noted for his modesty, we refer to the matter in the editorial department. No man in this country is so deserving of public favor as Gov. Furnas; no one has spent half, or a quarter, as much time and money as he for the good of us all."

TAKE YOUR CHOICE. Crossing the Atlantic, says the London Standard, we have the United States, with a rapidly increasing population, already numbering fifty millions, but exhausting their fertile soil with the rapidity that a spendthrift squanders his income; and it is within the range of probability that before many years are past she may cease to be an exporting country, unless more expensive systems of agriculture are adopted.

WHERE FARMERS AND MECHANICS intermarry, says J. B. Olcott in the Christian Union, in the old way, as the wiser ones continually do, keeping up an intimacy with the soil and an interchange of employments and implements through the garden, farm and workshop, mutations of fortune find them versatile, and as ready to fall upon their feet with every change in affairs as a cat.

"EVAPORATORS are a God-send to the farmers" says Mr. King in Rural Home. "Consider the millions of people who never see an apple; they can be supplied by evaporated apples. Some consider the evaporated fruit as good for cooking as green fruit. We can pick the best of our apples for barreling and shake the remainder off for evaporators."

CORN.—A writer in the Michigan Farmer advocates late planting, especially in heavy soils. He favors planting deep, or in a deep mark, so that the earth would naturally fall toward the hill. The error of many he thinks is ceasing to cultivate at the time when the crop needs the most attention—viz., when the tassels appear.

CATALOGUES, ETC., RECEIVED.

NOTE.—Readers are referred to our advertising columns for any particulars omitted in the following necessarily brief notices:

F. R. PIERSON, Tarrytown, N. Y. Illustrated Catalogue of Seeds, Fruits, Trees for the greenhouse, garden and farm, with descriptions and plain directions for their cultivation. We are indebted to Mr. Pierson for the original from which our engraving of the "Cumberland Triumph" Strawberry was made. An engraving from fruit raised at the Rural Grounds was published in our Strawberry number, Sept. 7, 1878. Our report of this excellent berry at that time was as follows: "Rather soft for market. Ripens in every part at the same time. Uniformly of large size. Vines very healthy and strong. Perfect shape—flavor good. The acute lobes of the calyx, from three to five, are so constant as to aid in determining the variety. Pale red or pink in color." Later experience not only confirms our first report, but makes us think more highly of it for home use. Mr. Pierson's catalogue is sent to applicants without charge.

JOSEPH HARRIS, "Moreton Farm," Rochester, N. Y. This well-known farmer sends us a four-line advertisement and his catalogue; the latter presumably for notice. As it is worth a good deal more to us than his advertisement, we presume it will likewise prove helpful to our readers. We have tried to speak of catalogues according to our estimate of their value to our readers and not according to the value of the advertisements to us. Many catalogues publish lists of garden, flower and field seeds comprising almost every variety known, whether possessed of any especial merits or not. Mr. Harris selects those kinds only which from his own experience he believes to be the best of their kinds. The catalogue is full of useful hints, the cream of his life's experience. He will send it free to those of our readers who apply.

HOVEY & CO., 16 South Market street, Boston, Mass. Illustrated Guide and Seed Catalogue for 1880. Sixteen of its ninety pages are given to novelties among flower, vegetable and field seeds. Among potatoes "Mammoth Pearl," which originated in Ohio, is spoken of as having produced 1,042 pounds from a half-peck of seed under ordinary cultivation—the largest potato of the yield weighing two pounds and ten ounces.

PRICE & KNICKERBOCKER, 80 State St., Albany, N. Y. This work of 80 pages and 450 illustrations—mailed free to applicants—is a catalogue of garden, field and flower seeds, with cultural directions, and of agricultural implements, farm and horticultural goods in general. This establishment, now in its 49th year, is better known, perhaps, as the "Albany Seed Store."

JAMES VEITCH & SONS, Chelsea, England Catalogue of Plants, including Novelties for 1879. One of the largest Horticultural establishments in England.

TUISCO GREINER, Naples, N. Y. Catalogue of warranted vegetable and flower seeds, plants, seed potatoes, nursery stock, etc. Free.

Everywhere.

RURAL SPECIAL REPORTS.

CAL., Carpenteria, Santa Barbara Co., Feb. 18.—We have had more frost and cold in this vicinity the present winter than for many years. The former, however, has done little or no injury, except cutting down some of the early potatoes. Roses and other flowers are bright and sweet. Early grain and grass are a good growth. The farming prospects were never brighter at this season. O. N. C.

CAL., Norwalk, Los Angeles Co., Feb. 2.—We are putting in a good deal of wheat in this section this year of the Odessa variety, which is said to be rust proof. We are also organizing an amber cane association for the manufacture of sugar. Corn has been so low we are obliged to try something else to help us out. J. K.

ILLINOIS, Baldwin, Randolph Co., Feb. 18.—Until the 13th inst., we had an unusually mild winter. On that day we had a severe snow storm, the first heavy snow this winter, but at this time the snow is about all gone, and we have indications of rain. The roads are well-nigh impassable from the rain that came before the snow, and afterwards the melting snow made them worse. Wheat looks well on an average; but in some places it is turning yellow from too much water; it does not look as well as it did some time back. The rise in the price of pork to five dollars per 100 pounds induced most farmers to fatten and sell all their pigs they could prepare for market. We hear less complaint of hard times among farmers, and there seems a general desire to improve not only their stock but their farms and houses. Wheat is selling at $1 05 per bushel; corn, 35 cents; potatoes, 50c.; oats, 30c.; eggs, 9c. per dozen. N. J. S.

ILL., Canton, Fulton Co., Feb. 27.—The past season here has been the driest since I came here, 22 years ago. Still we had a big crop of winter wheat, 35 bushels per acre in my neighborhood. Of corn we had per acre over 40 bushels; hay was half a crop; potatoes nearly a total failure. S. J. E.

ILL., Buckeye Center, Stephenson Co., Feb. 19.—Winter is going out, I suppose, without snow. Fall grain looks fine. Our market prices are: wheat, $1; corn, 28c.; oats, 30c.; rye, 70c.; barley, 60c.; eggs, 12½c.; butter, 18c. with a prospect of lower price; hops, $3.75. S. F. B.

IOWA, Viola, Linn Co., Feb. 18.—We are having an exceedingly mild winter. On Christmas eve, however, the thermometer marked 28 degrees below zero. Crops are good. Hardly any wheat is raised here. Last year oats yielded about 40 bushels to the acre—a fair crop; corn gave us from 50 to 60 bushels, and hay two tons to the acre. Oats are worth 30c.; corn, 28@30c.; hay, $7. We do not raise many kinds of grain. Dairies and cheese factories are all around us, and dairying is the chief industry among farmers in this part of the world. Raising fat cattle and hogs is no small item, also, in farm economy, as our country furnishes about forty thousand hogs for market, generally of the best sorts, ranging from 150 to 600 pounds per head. They are worth at present about $4.20 per 100 lbs. Of clover seed there are about two bushels to the acre and it is worth about $4 40 per bush. Eggs are selling for 12c. per doz.; roll butter, 18c.; milk is sold to the factories at $1 per 100 lbs. at present; last summer it was down to 45c. per hundred. D. C. W.

IOWA, Fredonia, Louisa Co., Feb. 20.—I raised what were called Kentucky beans in Mason County, Ill., and brought the seed with me and raised them several seasons in Muscatine County, Iowa. The cut and description of Cow peas in the RURAL, answer for my Kentucky bean. They were a grayish-brown. I planted them three beans in a hill; hills six feet apart each way. The vines completely covered the ground. I had about half a bushel too old to eat; these I boiled and fed to my pigs; the old ones would not eat them, but the small ones eat them greedily. H. I. N.

IOWA, Davenport, Feb, 16.—We are having a remarkable winter here. The thermometer has not registered zero since Christmas eve; roads are very bad, and farmers cannot market their last year's crops, so that it is going to make it lively for them when roads get good. G. W. T.

KANSAS, Black Jack, Douglas Co., Feb. 20.—The winter here has been open, and the fruit prospects are promising. We had large crops last season. Corn sells for 20c. now, but has been as high as 25c. A great deal of it is converted into beef and pork. E. O. P.

MICHIGAN, Watson, Allegan Co., Feb. 22.—We have had a very open winter thus far, in this part of the State—between two and three weeks of sleighing in December and the ground almost entirely bare the balance of the time. At the commencement of winter while the sleighing lasted, the business "boom" increased; but since then the roads have been so bad that the times have been rather dull; and as a consequence the prices of farm products have been depressed. They rule about as follows:—wheat, $1.15 to $1 20; buckwheat, 70 to 75c; corn, 38 to 40c; oats, 35 to 37c; barley 100 pounds $1.30; clover seed $4 25 to $4 50; timothy seed $2 00; beans 75c to $1.00; potatoes 25 to 35c; onions 75c to $1 00; butter 12 to 16c per pound; cheese 12 to 14c; eggs 10 to 15c; apples per bushel 75c to $1.00; cranberries per bushel $4 00 to $5.00; beef dressed, 4 to 5c; pork, 4½ to 5c; chickens dressed per pound 6 to 8c; turkeys 6 to 8c. Wheat looks well and a large amount has been sown.—H. E.

MICH., Three Rivers, St. Joseph Co., Feb. 20.—We have had a very open winter here—only very little snow, but lots of rain. Wheat was looking nice last month, but the top is looking yellow now. Wheat is worth $1.15 per bushel; corn runs from 30c. to 40c., according to demands for feed; potatoes, 25c. to 30c. per bushel; eggs, 12½c. per dozen; wood is scarce, and the price varies with the condition of the roads—it has been as high as $4 per cord. S. M. S.

MISS , Okolona, Chickasaw Co., Feb. 20—We are nearly through sowing here, having put in a larger acreage under crops than usual. The country generally is feeling good over the price for cotton, but this very fact is likely to prove fatal to the farming interest by stimulating our people too much to the planting of cotton to the exclusion of other crops A. M.

MO., Oregon, Feb., 12.—Fruit prospect not very promising, but I do hope there are fruit buds enough alive to give a good crop during 1880. We have no snow here this winter and sleighing has been at a discount. Winter wheat of late sowing is killed; that of early sowing looks well, but somewhat injured. Prices of all kinds of grain are down, but most farmers took advantage of good prices some time ago. J. W. M.

NEB., Purple Cane, Dodge, Co., Feb. 19.—Our weather is quite cold even for this time of the year; roads in grand order, stock in fine shape, and farm business going straight on without hindrance. Corn, 16c.; butter, 15c.; eggs, 12c. Spring coming on fast, but every one ready for it. Teams in good order, work enough to prevent them getting soft. No grasshopper eggs in the ground this year, and consequently no danger from them, except we are inundated again as in '74. If we escape this year, it will be the first time in seven years. S. R M.

N. Y., Sherman, Chautauqua Co., Feb. 25.—We have been favored with a remarkably mild winter with very little snow comparatively. Stock appear to be wintering quite well. Farmers are feeling better over the prospect of receiving better prices for dairy produce, as this is almost exclusively a dairy region, with the exception of fruit raising. Apples were a large crop through this section last fall, bringing on the average about $1.25 per barrel. The general belief was if it had not been for the extremely hot and unseasonable weather during gathering time, they would have brought $2 per barrel at least. The scorching weather impaired their keeping qualities very much. Baldwins stood the ordeal the best with me, while my faith in Roxbury Russet (my favorite heretofore) weakened somewhat. Prices of farm produce at present are about as follows: hay, $10 per ton; corn, Western, 60 cents; oats, 40 cents; butter, 20 to 25 cents; eggs, 14 cents per dozen; cheese, 15 to 16 cents. A great many cheese factories and creameries are being built and projected. The Great West, with its cheap, rich and virgin soil, is proving to be the mighty competitor that is crushing the heavily mortgaged farmer of the East. Of those that bought their farms during the high and inflated times during and following the war, a great many are throwing up their farms, and leaving for the frontiers to start life almost anew. Potatoes, which were a splendid crop here last season, are selling at 30 cents per bushel, with no market worth mentioning at that. One of my neighbors, while at the fair last fall, heard of a plan of treating potatoes, when the tops are killed by frost, so as to still secure a good crop. He saw a farmer that had a large patch of potatoes killed entirely to the ground by the heavy frost that visited this section upon the 10th of last June. Everyone knows that when potato tops are killed by frost, the roots will finally throw up new tops and bear lots of little tubers which will amount to but little. This farmer, to try an experiment, set his hired man with horse and plow throwing up ridges of soil, covering up every vestige of stalk, the result of which was he harvested a fine crop of potatoes. A way to stop an unruly cow or steer from jumping—nail a common horseshoe to one forward foot. This prevents the hoof from spreading, and consequently renders the animal unable to spring. This is claimed to be very effectual. It often happens that the best cow of a dairy will get into the habit of jumping into the meadow or corn field when nobody is around to drive her out. I think if we farmers would write about new ways of doing things, that come under our notice, we could be a great help to one another. A. E. B.

N. C., Warren Co., Feb. 18—Two inches of snow on the 2d. Good weather for plowing all winter; considerable has been done. Wheat and rye look well. Sowing oats is now the order of the day. Saw first peach-bloom today. Prices—corn, 80c.; oats, 75c.; cotton, 12c.; eggs, 12½c.; tobacco, 2c. to 75c.; fodder, $1 per hundred; cow peas, $1 25. M. B. P.

OHIO, Hillsboro, Highland Co., Feb. 18.—We have had an open winter and plenty of rain, only two snows—the last on the 4th inst. was eight inches on a level; next day the mercury stood five degrees above zero, the coldest day this winter, but on the 6th it rained again and has rained every few days since. Wheat looks well, almost too rank for this season of the year; a larger acreage sown than last year. Wheat is worth $1.15; corn, 40c.; oats, 35c.; potatoes, 25@50c.; cattle $2 50@$3: hogs, $3.75@$4, nearly all sold. Hay, $10@$12 per ton; apples, $1@$1.50 per bushel—scarce; eggs, 10c.; butter, 16c. We have monthly stock sales on the first Saturday of the month; at the last sale about 100 horses and mules were sold to Cincinnati and Eastern buyers at prices ranging from $50 to $100. Fields and mud roads are very soft, and turnpikes are cut through in many places.

UTAH, Salt Lake City, Feb. 15.—I have just returned from a trip through the northern counties of this Territory, on business for the Salt Lake Herald and Utah Farmer. In my travels wherever I found the RURAL I heard it well spoken of. It certainly is the BEST and the CHEAPEST agricultural paper published. The winter has been extremely cold and an unusual amount of snow has fallen, and there is a big demand for even wheat straw to feed cattle in the north where I have traveled, and a great many cattle have died of cold and hunger. The same causes are almost certain to kill great numbers of sheep all through the Territory, as very few sheep raisers in the South and West take the precaution to provide any kind of feed or shelter for their flocks during the winter. Several years ago thousands of sheep starved to death on account of an unusually severe winter. Some sheep raisers and sheep herders lost almost every head—a shock that even to the present day they have not recovered from. The great excitement now in Utah is the digging of canals to take out water on to the vacant land that private enterprise has not been able to handle. A bill is before the Legislature here to charter and allow Salt Lake City to take out the Jordan River (which carries the water of the Utah Lake into the Salt Lake) on to the "bench" land east and south of this city; and also to issue bonds, etc. But there is considerable feeling against the enterprise because the land south of the ditch has been "filed on" by wealthy men, who are trying to use the city funds and credit for their private interests, and because on this account, the canal will be no advantage to the majority of the inhabitants of the city proper who are very heavily taxed already. What the conclusion will be I am unable to guess, but if the land below the canal could be put into the hands of the laboring people to build and make improvements on it, the projected canal would certainly be a very good move; but if it is to enrich speculators, it will no doubt be cried down by the people of the city. There is another large canal being taken out of the Logan River in Cache county; and also one from the Snake River, in the south of Idaho, which is being opened by the people of Cache county for a stock company, and will be used for mining and agricultural purposes. If there was a clause in the Land laws, allowing large companies to take out canals where private people were unable to manage them, but allowing the company to hold a portion of the land adjoining as a subsidy, and the balance to be open to homestead in 40 or 80-acre claims, and allowing these homesteaders to buy water-right thereto at a certain price or at a certain percentage above the cost of construction, it would be a great advantage to a great many people, and to the government.

The grain trade in this Territory is dull just now, but people are holding on to their produce with the hope that there will be a rise in the market in the spring; but the merchants in the north of the Territory have crowded the prices down since the deep snows and the severe winter put an end to freighting. Wheat fell from 85 cts. to 65 cts. in Cache county, and other grain dropped in about the same proportion, while the prices have risen somewhat in the center and southern portions of the Territory. On the Sevier wheat now brings $1, and is very scarce at that. There is a very great amount of snow in the mountains, and it is feared that damaging floods will occur in the vicinity of large streams, and the people are making arrangements to protect their dams and water-gates from being carried away by the high waters. Farmers who have been short of water in times gone by, are happy in the belief that they will soon have plenty, and consumers are buying breadstuffs in small quantities, hoping that food will be cheaper when spring opens and the farmers can haul their grain to market. W. M. C.

The Querist.

ANSWERS TO CORRESPONDENTS.

Barnyard Manure, Gypsum and Tan-bark.

W. A. L., Brooklyn, N. Y., owns a farm that has been run down by continued cropping. The soil is a sandy loam. He can buy barnyard manure for $1 per two-horse load, gypsum at $8 per ton, and spent tan bark at five cents a bushel. He is thinking of buying the manure to plow under and then top-dress with gypsum, and asks, if tan bark is worth five cents per bushel, and if plaster loses its strength by lying under cover.

ANS.—We would purchase all the barnyard manure that could be afforded, at the price named. At $1 a ton, the nitrogen in half-rotted manure will cost six cents a pound, the potash two cents and the phosphoric acid three cents. No other fertilizer can be procured so cheaply as that. Tan bark is worth nothing in a fresh condition and is very difficult to rot. If burned to ashes it may be worth about as much as the labor of burning, so that it would be dear at five cents a load. Plaster is as unchangeable as so much sand, so long as it is kept dry or undissolved. It is simply ground gypsum which is a permanent rock. Gypsum is a valuable fertilizer in some cases; what these cases are no one can tell until he has tried. All that is known of its action is that it *very often* has a good effect on clover and corn on some soils. It is a cheap article as but 80 to 100 pounds per acre are used, and a trial will cost but little; we should expect but little effect from it until the soil has been improved by using barnyard manure.

Clapp's Favorite Pear.

B. A., East Deering, Me., set out, last spring, some 50 standard Pears, selecting Clapp's Favorite by the advice of his nurseryman, who promised that they would be vigorous, prodigious bearers, and delicious for eating—fully equal to Bartlett. Having seen no mention of this variety in the numerous reports of Pomological Societies in the RURAL, he anxiously asks for some information about it. At present his trees are doing extremely well.

ANS.—Clapp's Favorite is thought to be a cross between Bartlett and Flemish Beauty. It ripens a week or ten days before the Bartlett. It is an excellent pear, juicy and melting, though not of the first quality. It sometimes rots at the core. Maine, we believe, has not reported that it thrives well, for what reason we do not know. Our correspondent is mistaken. The RURAL has mentioned it many times within the past two years. The tree is everywhere, so far as we know, strong and vigorous.

Removing the "After-Birth" of a Cow.

W. S. M., Benderville, Pa., asks what shall be done to a cow that retains her after-birth for several days after calving; is it safe to have it removed, and if so, how should the operation be done.

ANS.—Should a cow not *clean* within two days, it should be removed thus:—take a towel in the left hand and with it grasp the placenta hanging from the vagina, then with the right hand, *well oiled*, follow the placenta into the uterus and *unbutton gently*—no force is required. It may be held by from 10 to 60 cotyledons or buttons, and requires considerable patience to do it right—afterwards with a syringe wash out the uterus with a weak solution of carbolic acid and water (1 to 40), and if the animal is feverish give ½ to 1 pound of Epsom salts, according to size of cow,

Lice in Sheep.

G. W. S., Falls City, Neb., asks how to get rid of lice on sheep.

ANS.—These are generally found on the side of the sheep's neck and the inner parts of the thighs and arms. They cause much itching by which the sheep is impelled to thrust its head between the bars of gates or fences, or to kick and stamp. Occasionally sheep are found strangled by becoming fixed in their attempts to rub their necks, or with their legs broken in their attempts to rub them upon rails. Lice are rarely found on yolky-wooled sheep or upon those that are dipped regularly. To rub the infested parts with some of the following preparation is generally an easy remedy: Lard one pound, flowers of sulphur, two ounces, creosote, 20 drops; one pint of oil may be substituted for the lard.

Raspberries for Drying and Marketing.

C. E., Sinclairsville, N. Y., is thinking of setting out a Black Raspberry patch, and asks which varieties are likely to prove good market berries and good for drying, especially for the latter purpose.

ANS.—The best Raspberries for the purposes are Doolittle's Improved and Mammoth Cluster. These are both very prolific and "waste" less in drying than others, the Mammoth being

preferable of the two for drying or market, *except* when early berries are an object. The Gregg is a large, fine, jet-black and profitable variety for market, and is recommended for drying by those who have put it to this purpose at the West. The objection to Davidson's Thornless is that it is too uncertain a cropper.

Miscellaneous.

Mrs. G. M. H., Helm's Store, Va., has a Camellia that refuses to bloom; the buds fall off and the leaves have little yellow spots on them; in short, it is sick and she is afraid it is going to die; In this dilemma he comes to us for a prescription.

ANS.—The first duty of a doctor when called upon to prescribe for a patient is to ascertain the cause of the trouble and, if possible, remove this cause when discovered. We would ask if the plant has received correct treatment. Are there no scales on it? Has it at any time lately been exposed to a sudden snap of cold, or is the room perhaps too warm? It should not be over 50 deg. Fah. Is the plant properly drained, and has it received neither too little nor too much water? Or maybe the room has been filled with smoke for some hours? Any of these causes may weaken the plant and make it drop the buds. In the beginning of April it will be warm enough to remove it to the open air. Then give it fresh soil, (a mixture of equal parts of good turfy loam and peat with a liberal addition of sharp sand, is best) and place it in a cool, shaded place. We trust the patient will revive.

F. C. D., Boletourt Co., Va., asks 1, whether the present firm of Briggs Bro's. & Co., Rochester, N. Y., is reliable; 2, what is the best commercial fertilizer to insure good fruit on a peach orchard five years old on rather poor sandy soil; 3, which would be preferable—pure raw bone and wood ashes, or raw bone and potash in its most available form, say muriate of potash; 4, the best proportion for mixing the above, the proper quantity to the acre and the right time to apply it; 5, where can potash be had pure and cheap; 6, what is the composition of soil that produces healthy trees and fine fruit; 7, how do successful Delaware peach growers on sandy soil fertilize their orchards without manure.

ANS.—The *successors* to Briggs Bro's. & Co., are reported responsible; the old firm failed a few years ago. 2 and 3. Ashes or sulphate of potash and bone. 4. At the rate of 50 bushels of unleached ashes and 300 pounds of bone flour or 200 pounds of sulphate of potash in place of the ashes. For your climate, the present is a good time to apply. 5. Of any of the firms referred to in this week's RURAL NEW-YORKER. 6. That depends upon what fruits are desired. The Pear and Plum *e. g.*, need more potash than the Cherry and Apple. 7. We do not know.

D. L. I., Ausgusta, Ark., says that on the banks of sloughs running through low lands there is a deposit of black mud which comes in hard lumps like clay; and he asks whether, if this be composted with cotton-seed meal and hard-wood ashes, it would be of value for gardens, and if composted in summer, whether it would be fit for use in the following spring, and especially whether this is the "muck" referred to in the History of a Poor Farm.

ANS.—Muck varies in its composition. (See the article by Professor Caldwell in Rural of Feb. 14, page 102). Unquestionably, if composted as here suggested it will be of value. Yes, it will be in condition to use in the spring if thus composted. Such a mixture would be always beneficial, although a longer delay would sometimes be advantageous. It depends, however, on the character of the muck. A great deal of useful and reliable information on the subject of muck, is given in Professor Johnson's analyses at the Connecticut Experiment Station, published on this page.

S. B. D., Fort Madison, Ia., has a horse that has bruised its leg by kicking against the stall, causing a lump on the bone below the gambrel joint. The leg swells at night, and he inquires how he should treat it.

ANS.—Place the horse in a large stall so that there is nothing for him to kick at. If the enlargement is recent, clip the hair short and apply the following blister rubbed into the skin, smearing the leg beneath with sweet oil to protect it:—Cantharides, half an ounce; mercury, one drachm; lard, four ounces. Be sure that the animal is kept tied so that he shall be unable to get his teeth on the blistered part, and after the blister dries, wash with warm water and soap to remove the scabs. If the enlargement is old and bony, we fear that it is permanent; yet would advise that a good veterinary surgeon be called to apply the actual cautery.

W. M. N., Darien, Conn., has a seedling Grape which he would like to improve by grafting, and he asks how it should be done and when.

ANS.—The grafting should be done immediately, if possible before the sap begins to flow. This method of ennobling the Grape is but seldom resorted to because the union of the clon and stock will always be imperfect and sometimes fail entirely. The stock should be grafted on the portion below ground. Cleft-grafting may in this case be employed to advantage, as the clon can be held more firmly in position. Cut the clon from a branch of last year's growth and let it retain two well developed buds. Proceed with the operation as in grafting apple stocks, and when finished bury the plant so deep that the upper bud on the clon will be level with the surface soil.

C. M., Collinville, Ont., asks, 1, whether the Rice pop-corn mentioned in J. M. Thorburn & Co.'s catalogue is the Rice or Egyptian corn described as grown in Kansas; 2, as about half the peas thereabouts are weevil-eaten, he remarks that unless such peas germinated, they'd have very few peas in his neighborhood, and he's going to experiment with 50 of them this coming spring; 3, the name of some lettuce seed sent us for trial last spring.

ANS.—1. We do not find Rice pop-corn in the catalogue mentioned. 2. It is, for the most part, those not weevil-eaten that grow. Try the experiment. Sow fifty weevil-eaten peas and tell us how many germinate. 3. The lettuce is Green Cos, if we are not mistaken in the kind you sent us.

G. T. F., Whippany, N. J., asks, 1, how to make a printer's "ink roller"; 2, how to make the gum used on envelops, postage stamps, etc.

ANS.—Printers' rollers are made of glue and molasses—a pint of molasses to a pound of glue (best) and boiled in a glue kettle until sufficiently thick. It takes from half to a whole day to boil the glue and molasses sufficiently for a roller. 2, A good mucilage is a solution of gums tragacanth and acacia. We don't know whether this is precisely what is used on envelops and stamps, but it is just about as good.

O. M. T., Orland, Ind., has noticed that there is a difference in price between white and red onions, the white taking the laurels; he is thinking of going into raising onions and asks if the red are more productive than the white ones.

ANS.—White onions command the highest price, because they are handsomer and smaller, and consequently better suited to pickling. The Yellow Danvers is especially a favorite. The red are the most productive.

I. H., West Granby, Conn., asks 1, where he can get Blount's Prolific corn; 2 which is the best work on cryptogamic botany.

ANS—.1, Blount's Prolific corn is now sold by many seedsmen. J. M. Thornborn & Co., 15 John St. N. Y. advertise it. 2. The best general work is perhaps J. M. Berkeley's Introduction to Cryptogamic Botany. It is an English work and can be had through bookstores.

W. B., North Parma, N. Y., asks how to plant the Lily of the Valley. He sent to the seedsman for clumps of this plant, but received only some "pips."

ANS.—Prepare a bed in a shaded place where the ground is not exhausted by large trees, and plant the roots in rows six inches apart, each way, and three inches deep. In the course of a year they will entirely fill the bed.

A Constant Reader, Worthington, Mass.,—asks, 1, if pear clons will succeed on apple stock; 2, will plum and cherry clons cleft-grafted live; 3, at what season should the cherry be grafted.

ANS.—1, Yes, for two or three years—then fail. 2, Yes. It is not the best way, however, See Rural Feb. 14, p. 114. 3, Early in spring, before the buds have swollen.

H. B., Greenville, S. C., asks for the best method of keeping moles out of the peanut patch.

ANS.—For seven years past we have endeavored to keep moles away from our garden without any succes at all adequate to the time and trouble involved. Who has been more successful—and how?

H. B., Greenville, S. C., asks which is the best way of planting corn—in hills or drills.

ANS.—The largest crop of corn we have ever raised was cultivated flat—that is, no hills were made about the plants, and the corn was sown in drills about 18 inches apart—the drills 3½ feet apart. It is more trouble to cultivate in this way.

J. M. W. L., Marshall Hall, Md., asks what would be the probability of success in planting an old peach orchard with other fruit—the land yields 50 bushels of corn and is now in clover.

ANS.—Any land that will produce 50 bushels of shelled corn per acre, will do well if planted to any fruit suited to your climate.

E. L. C., Coopersville, Mich., sends a plant for name. It is in a hanging basket; blooms profusely in winter, but shows only an occasional flower during summer. It is variegated, some of the stems being yellow and others green.

ANS.—It is Peristrophe or Justicia angustifolia variegata.

G. C. B., North Rochester, Mass., asks how to prevent a horse from falling back when hitched.

ANS.—Such animals are dangerous and should be put in the hands of a good trainer (if young), or sold to some one who prides himself on his ability to cure such vices.

J. E. G., Berlin, Wis., asks where and at what price can Defiance wheat be had, as he wishes to try this new spring sort.

ANS.—Mr. Pringle, of Charlotte, Vt., is the originator and B. K. Bliss & Sons, of this city are the introducers. The price is, one pound, 40 cents, $2 per peck; $7 per bushel.

A Subscriber inquires where the Sibley level mentioned in an article by Prof. Carpenter can be purchased.

ANS.—This level was mounted by Mr. Sibley, and is now manufactured by A. J. Bicknell, 27 Warren St., New York. Its cost is $10. The instrument has no telescope.

W. H. W., Cranford, N. J., asks where can he get a hand drill and cultivator combined.

ANS.—Matthews' Drill and Cultivator, Everett & Small, Boston, Mass.; Planet Drill and Cultivator, S. L. Allen & Co., Phila., Pa.; Monitor Drill and Cultivator, Newburyport, Mass.

S. F. B., Buckeye Center, Ill., asks if Roses from seeds produce the same flowers as to color.

ANS.—They cannot be trusted to do so. Other questions will be answered under Domestic Economy.

A. R., asks where he can get Havana tobacco seed.

ANS.—Tobacco seed of all kinds will be found in many of the catalogues noticed in these columns. Price about six dollars per pound.

J. B., Erwin, East Tenn, sends a small stone and asks what it is and if of any value.

ANS.—It is crystalized carbonate of lime, or limestone, and is of no value.

G. M. F., Bazine, Kan., sends a mineral and wants to know what it is.

ANS.—It, too, is crystalized carbonate of lime. Clay and other impurities make it mottled.

J. C. D.—Probably an Ipomœa of some kind. We shall plant seeds and let you know in due time.

TO WHOM IT MAY CONCERN.—We have received a considerable number of inquiries about the reliability and business standing of several firms in different parts of the country; but the full names and addresses of the inquirers not having been given, their questions went promptly into the waste-paper basket. It costs us time, trouble and cash to hunt up all such information and the least our inquirers can do, is to comply with the regulations which, for very good reasons, we have established with regard to the conditions on which information is given in this Department. ONCE MORE, THEN, *all* questions to secure attention, must be accompanied by the FULL name and address of the inquirer, not for publication, but because it is often more satisfactory to us to answer through the mail, and for other reasons.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, FEB. 28th.

Sulphuric acid		.46	.06
Sand, Silica, etc, insoluble in acid	59.20	78.04	84.71
	100.00	100.00	100.00
*Containing Nitrogen	..	0.29	0.15

314 was sent by D. H. Van Hoosear, Secretary East Wilton Farmers' Club, in August last, described as "deposit from the bottom of a pond hole." The partial analysis showed such large proportions of water and insoluble matters, as to lead to the conclusion that the deposit would have little more value as a fertilizer than a good soil.

The sample 322 whose analysis is next given was sent, labeled dried mud, by Mr. J. I. Stevens, of Essex, who states that "its effect as a top-dressing for lawns and also on mowing land, has proved greater for good than anything I have ever seen. On many crops it has given me better results than $45 crop foods I have purchased. This mud is under water the year round."

The analysis agrees remarkably with that of pond mud from North Woodstock, mentioned in the Station Report for 1877. It contains, however, a little more phosphates and sulphates. In reply to Mr. Stevens' inquiries, was written as follows:

"The dried mud contains every element of plant-food in about the proportions that are usually present in stable manure, or in good composts. Like the fertilizers just named, i contains but about 3 per cent. of immediately available plant-food; the other 97 per cent. being water, sand, or clay, vegetable matters, oxides of iron and alumina, not differing in character or fertilizing value, so far as is known, from the same substances as they make up the bulk of ordinary soils. Unlike stable manure and ordinary composts, the mud contains a considerable amount of sulphuric acid in the form of sulphate of lime. The mud contains 0.46 per cent. sulphuric acid, while stable manure has 0.10 per cent. or less. It is quite likely that this fact may have made the mud so useful in your experience."

Doubtless a pretty liberal application of the mud would be required to produce the striking results Mr. Stevens observed.

In a recent note Mr. Stevens states that the mud sent by him was from a cove or pocket from the Connecticut River; the sediment is brought down in the spring freshets by the Connecticut, the cove being connected with the river by a narrow channel. There is no current in it, and suspended matters are deposited at such a rate as to have reduced the depth of the water three feet since the remembrance of elderly people. There is but little matter washed in from the surrounding hills. The river at this point contains salt from the setting back of the tide during only four to six weeks annually. Some entire years there is no salt at all in the river at this point. The quality of the sample sent was not up to the average. It should have been taken from the middle of the cove.

Mr. Stevens also remarks; "Our mill ponds a few miles back from the river, contain a rich, black mud, quite deep and with a very strong smell. It has been tried on various crops, but kills everything. After being hauled and dried it turns from black to white, and puckers the mouth like alum."

The astringency here referred to is due to soluble salts of iron or alumina. Composting with a small proportion of slaked lime will decompose these salts and render the black mud a safe and serviceable application.

Sample 334 received from S. Palmer, Woodstock, consists almost entirely of sand and silica, with the merest traces of fertilizing elements. Much of the silica exists in the form of the skeletons or shields of microscopic infusorial plants which are common in the water or swamps and bogs. From its light-gray color it might be mistaken for shell marl, but on mixing with acids, like vinegar, it effervesces very slightly, containing but a trace of carbonate of lime.

Peat or Swamp Muck.

Three samples sent by G. M. Dennison, Esq., of New London, are from the town of Old Saybrook.

335 and 341 from the farm of Mr. Dennison, 342 is traversed by the Connecticut Valley Railroad, near Mr. Dennison's land.

	335	341	342
Moisture	85.25	81.40	87.22
*Organic and volatile matter	12.52	12.49	10.42
Ash	2.23	6.11	2.36
	100.00	100.00	100.00
*Containing nitrogen	.43	.42	.27

Reckoned in the dry state the composition is as follows:

	335	341	342
Organic and volatile	84.67	67.08	81.53
Ash	15.13	32.92	18.47
	100.00	100.00	100.00
Nitrogen	2.91	2.24	2.11

The dry swamp muck is thus seen to contain 2 to 3 per cent. of nitrogen, which, under the action of an alkali like lime or ammonia, may become available as plant-food. The organic matter itself under favorable conditions serves to liberate lime, potash, etc., from the mineral matters of the soil.

There can be no doubt that the application of this swamp muck, especially to poor, light soils, would be very serviceable. Evidently, however, the large proportion of water which the fresh muck contains makes it a nice point to decide how much can be spent upon handling it without consuming the profit of application. The proper mode of using swamp muck is to throw it out where it will drain and dry for some months, during frosty weather, and to employ the weathered muck as an absorbent in the stables or barn-yard, or to compost it with lime, fish or animal matters yielding ammonia by their decomposition.

S. W. JOHNSON, *Director.*

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
78 Duane Street, New York.

SATURDAY, MARCH 6, 1880.

REMOVAL.

On and after May 1st of this year the Rural New-Yorker will occupy its new quarters, No. 34 Park Row, corner of Beekman Street. We are glad, indeed, to leave our present gloomy building—to which we have been held by a long lease—for one that, being half windows, receivesa full share of air, light, and sunshine. The location is one of the most prominent in this city, being diagonally opposite the City Hall Park—directly opposite the Post-office on Park Row and the World building on Beekman Street. Such a location is in keeping with the status of the Rural New-Yorker, which, whether its financial standing, its influence, or its actual *paid-up* circulation, one or all, is considered, ranks to-day as the first *landcultural* journal of its class in America.

NOTICE.

is now given that all of our yearly subscribers who, having applied for our seeds and sent the required amount of postage stamps, shall not have received them by the 13th inst, will please notify us to that effect. The Raspberries will be sent as the weather permits. Subscribers will notify us of the non-receipt of these later.

Several subscribers who take the Rural with the Inter-Ocean have sent us stamps for plants and seeds. We would state that our arrangements with the Inter-Ocean are such that all who forward their subscriptions through that journal are not required to pay postage on our "Free Plant and Seed Distribution."

For the last time during the present subscription season we announce that our Premium Lists, Plant and Seed Supplements, Posters and specimen copies will be sent free to all applicants. Those renewing their subscriptions would promote the interests of the Rural New-Yorker if they would at the same time forward the subscription of a friend or neighbor.

We trust that the Strawberry Chapter of this week's Rural New-Yorker will give timely and all needed information respecting the preparation of the ground, culture, varieties, etc. There are many new sorts of good promise not mentioned; but why mention them so long as they have not been tested over a wide range of country. There are also many old sorts not mentioned. Full lists of these will be found in the catalogues announced in our advertising columns, and those to which special attention has been called by editorial notes elsewhere. Half of one's success in small fruit culture depends upon a selection of kinds adapted to the soil and climate. The Rural has done all it could thus to assist its readers in a pursuit full of pleasure and profit. Next week we shall place before them a somewhat exhaustive chapter upon the Raspberry.

Farmers, is it not worth your while to experiment more than you have done? Suppose upon six little plots you sow six different kinds of beets and find that one of the six yields more and keeps better than the others. Suppose you plant six different varieties of corn on little plots and find that one variety will yield more than the others. Suppose you sow different fertilizers on separate little plots—ashes or potash salts for potash; dissolved bone-black for phosphoric acid; nitrate of soda for nitrogen, etc.—and you find that oats, spring wheat, potatoes or any other crop thrive notably better on one plot than on the others, will not such experiments pay you? Years ago it was by such experiments we were induced to sow Clawson wheat. It was then known only to a few. Years ago we paid three dollars for a pound of Early Rose potatoes, and we raised this potato for two years before its great value became generally known. So, latterly we have raised Beauty of Hebron potato, Mold's Ennobled Oats, the Kinver Mangel and Doura. It has paid *us* to experiment. We respectfully submit that it will pay *you*. Spring is upon us; there is no time for delay. Prepare your test plots and select your seeds!

Last Thursday, Feb. 26th, a bill was introduced into the House of Representatives of this State, by Mr. Skinner, for the establishment of an agricultural Experiment Station, with the object of promoting agriculture in its various branches by scientific investigation and experiment. The bill provides that the station shall be under the control of a Board composed of a member from each of the different farmers' clubs of the State and one from the Western New York Horticultural Society, and the sum of $8,000 is appropriated for its maintenance. The Rural New-Yorker has frequently advocated the establishment of an agricultural experiment station, not in this State only, but in every State in the Union, and more especially in all the older-settled States. One of the chief and most immediately beneficial objects of such an institution would be to lessen or prevent frauds in the sale of commercial fertilizers, and in the old States the need of these is much greater and their sale far more extensive than in the newer States, hence the greater the benefits there of a reliable check upon fraudulent dealers in these wares. Wherever such stations have been already established, notably in Connecticut and North Carolina, they have been highly beneficial, mainly, of course, to the farmers of the States for whose advantage they have been founded, but greatly also to those of the entire country; for in these days of multitudinous agricultural periodicals an agricultural truth discovered or well elucidated in one part of the country, soon becomes the common property of the whole.

ALL TOGETHER!

When, about a twelvemonth ago, the British Government placed restrictions on the importation of live cattle from this country, on the ground that pleuro-pneumonia existed among some of our herds, many of the Eastern agricultural journals insisted either that no trace of the disease could be found in the United States, or that the type which was proving disastrous in some sections differed from that which was committing havoc in Europe, in that it was non-contagious and therefore not dangerous to the health of our cattle generally. Most of the Western papers of the same class either followed the example of their skeptical Eastern contemporaries and boldly denied the existence of the malady, or, conceding that a few cases might be found here and there in the Atlantic States, parsimoniously insisted that the whole expense of stamping out the plague should be borne by the States in which it was prevalent. The Rural New-Yorker, obfuscated by no short-sighted policy of expediency, regretfully acknowledged the existence of a few scattered instances of the malady in the States east of the Alleghanies, and fully awake to the danger to which the vast cattle interests of the entire country would be exposed from its continuance, strongly urged that effectual measures should be taken for its prompt suppression, both by the States which suffered from its ravages, for the safety of their own stock; and by the National Government, for the protection of the herds of the whole country to which its presence among us was a standing menace.

Our incredulous Eastern contemporaries have since opened their eyes to the existence of the plague, and our economical Western friends no longer insist that the danger to their own vast herds shall be averted solely at the cost of the few States that are already heavy sufferers from its presence within their borders. We trust, therefore, that all parties will offer a hearty support to the bill introduced last Tuesday into the Lower House of Congress for the organization of a National Board of Commissioners, whose duty it shall be to prevent the spread of pleuro-pneumonia and other contagious diseases among our domestic animals, and to stamp out all such plagues wherever they may make their appearance. Such a measure is urgently needed by the West, the Middle States and the South as a safeguard for their untainted herds, as well as by the East for the prompt suppression of so deadly a source of disaster among their cattle. Moreover, every State, county and township from the Atlantic to the Pacific and from Canada to the Gulf, is deeply interested in the eradication of hog cholera and the other contagious stock maladies whose suppression it will be the duty of the Commissioners to devise. Let all, therefore, join earnestly and unitedly in support of the establishment of this much-needed organization.

THE MAPLE SUGAR AND SIRUP INDUSTRY.

This is an industry of considerable, though not vast, importance in this country. It is limited in its extent of area by climatic and other causes, and in its increase, even in that area, by the slow growth of the trees and the difficulty of rearing orchards of them. The part of our country on which the Sugar Maple grows naturally lies almost wholly north of the 40th parallel of latitude and chiefly east of the west line of Minnesota, and only very limited portions of this area have such soil as to produce enough Maple trees to make the manufacture of sirup and sugar profitable. The chief of these localities are Vermont, parts of New York, a dozen or more counties in northeastern Ohio, and considerable portions of northern Michigan, Wisconsin and Minnesota. Further, Maples are not likely to be propagated and orchards reared; for though they thrive splendidly when planted on many sandy and gravelly loams where they do not grow spontaneously, yet it takes nearly fifty years from the seed to rear trees large enough to tap profitably. Most men are not willing to wait so long for returns, and the land is probably worth more for other purposes.

But though this industry is thus limited and circumscribed, there is no reason why it should not be developed to its full capacity in quantity and quality where Nature furnishes the facilities; that is, trees in abundance and suitable climate. Yet such is not the case. In Vermont the industry is probably developed to two-thirds of its full capacity, both in quantity and quality; in New York to perhaps half of both; in Ohio to less than half, especially in quality; while in the other States almost no attention, as a rule, is paid to quality, and probably not a quarter of the quantity is produced that might be.

As for quantity, there is certainly no good reason why the maximum should not be produced. The trees are already on the farms, and may as well be tapped as not. The work comes at a season when little other farm-work can be done by men or teams. The wood for boiling, with good apparatus, need not cost for average localities more than a cent for each pound of sugar, since much rubbish from old fences and fallen wasting timber can be used.

But quality is the great point. Maple sugar, as a simple sweet, can probably never compete in price with cane sugars or sorghum sugars—if the latter prove a success. For cooking purposes the peculiar flavor of the maple is a damage rather than an advantage. Not so, however, with the sirup. This is used chiefly with buckwheat or other pan-cakes, or as a simple delicacy, like honey, with warm biscuits or with bread and butter. And if made of the very best quality, there is no possible sweet with so delicate and delicious a flavor. It is fit to have been the nectar of the gods, and it is universally appreciated by men when once tasted in its perfection.

Now, we think it a waste of good material to make maple sap into sugar, and use it for ordinary cooking. We think the entire possible maple product of the United States, if made into sirup of the very best quality, and pushed through the channels of trade, like our canned goods, could be used as a delicacy and at a high price. But it would need to be strictly prime, soldered, while hot, in quart and half-gallon and gallon cans, so as to retain flavor perfectly, and then kept on sale in our groceries all over the land, like honey or canned goods.

But how can such quality be attained? Only by great care and the use of the best apparatus, fixtures and vessels. From first to last the sap should touch nothing but tin or galvanized iron, and it should be boiled in the Cook's patent evaporator. Here has always been one great obstacle—these evaporators have been so very costly. The profits to the one Cincinnati firm that holds the monopoly of the United States, have been enormous. We happen to know that that firm has charged $25 as its lowest price for the right to manufacture *a single evaporator*. Hence it is but fair to assume that that has been their profit *on the patent alone*, at least on the larger sizes of evaporators. If Congress, however, now righteously refuses to extend *again* a patent for whose *second* extension no reason can be given except the continuance of a great monopoly, and the further enrichment of a firm already an immense one—we say if Congress refuses a second extension of that patent the price of these evaporators will be at once immensely reduced. There will then be no valid reason why one of them should not be found in every sugar camp, and the quality of the maple product be at once vastly improved. The evaporator is an absolute necessity for sorghum. It is an immense improvement for maple.

Then, if some of our huge fruit-canning establishments, always idle in April, would buy and can immense quantities of only the very choicest maple sirup or "maple honey," and push it through the channels of trade just as they do their other canned goods, the problem would be solved. Farmers would be forced to make the best, and would get a fair price. The canners would make a fair profit from their otherwise idle establisments, and the consumers could always find the best "maple honey" at their grocers', and the whole maple product of the country would be used as a rare delicacy, instead of being degraded to a simple sweetener of cakes and pastry.

BREVITIES.

The Raspberry will be treated very fully next week.

Mr. Batcham writes us that he never felt so encouraged about agricultural progress in Ohio as at this time.

We believe that Mr. Wm. Crozier was the first to introduce Webb's New Kinver Mangel in this country, illustrated on our first page two weeks ago.

Turer is a new Pelargonium (Geranium) of which we think a good deal. It is called A. Baltet. The flowers are double, pure white, and last a long time. It is admirable for bouquets.

Mr. G. W. Fuller, (of Minnesota) tells us in a late communication that a Clapp,s Favorite Pear on mountain ash roots, has stood their climate for eight or nine years without injury, while Flemish Beauty on pear stock, has been top-killed more than once during this time.

According to experiments of the Ontario School of Agriculture (Canada), by adding $5.40 worth of bone dust to farmyard manure the crop of wheat was increased $7.20 per acre. By adding nitrate of soda the value of the crop was increased $10 00. Lucerne is deemed profitable, having a season from April to October.

The Dublin Farmers' Gazette says that Irish farmers for some years past have used large quantities of artificial manure on credit. That source of fertility is now shut out because the local merchants who supplied the manures will no longer give credit. The Gazette suggests it would have been well if reductions of rent had been made in the shape of genuine high-class manure instead of money.

Farmers, we tell you, we *advise* you, we beg of you to plant a bed of Strawberries the coming spring, if your garden is not already supplied with this delicious little fruit. Have you no time? Prepare a plot four feet square, make the ground rich and mellow. Buy or beg one dozen plants of Sharpless, Charles Downing or others spoken of on our first page. If the second year you do not enlarge the plot and *find* time to take care of it, the Rural New-Yorker hereby agrees to pay you for your lost time.

Our advertising columns for the next several months will, we think, be found of unusual interest to our readers. They will show for themselves that we exercise all possible care to exclude frauds and all announcements calculated to deceive. We would thank our readers if they would promptly inform us of any unfair dealings on the part of those whose advertisements are presented. We hold ourselves under obligations to investigate such complaints and to expose those against whom they are ascertained to be well founded.

Mr. G. W. Strong, of Davenport, Iowa, who won 2d prize of the Rural Corn Premiums, sends us the following acknowledgment of its receipt. The premium consists of a Feed and Meal Mill, valued at $65, and contributed by the Challenge Mill Co., of Batavia, Ill.

Davenport, Iowa, Feb. 16, 1880.

Editors Rural New-Yorker:

"I hope you will excuse me for not notifying you several days ago that I had received the feed mill, all in good order, and it is a splendid-looking mill. I have not run it any yet, but shall in a few days. There are several of the same kind of mills in use here, and they do good work. Please accept my thanks for the liberal premium, and in anything I can do to help the circulation of the Rural you can command me, for I think it is the best agricultural paper in the world."

Mr. A. Thwing of Chardon, O., the winner of premium No. 7, also acknowledges the receipt of his prize as follows:—

Eds. Rural New-Yorker:—Corn-sheller, from Livingston & Co., received in good order. It works very well.—Respectfully,

A. Thwing.

Various.

THE RILEY CONTROVERSY.

WASHINGTON, D. C., Feb. 19, 1880.

TO THE EDITOR OF THE RURAL NEW-YORKER:

Sir:—I desire, in the briefest manner possible, to illuminate the fog with which Prof. Riley, in his communication to you, of the 2nd instant, seeks to envelop certain matters connected with his resignation and subsequent attempt to be reinstated.

I am characterized as an "indifferent stenographer," the evident desire being to cast discredit upon the conversations as reported. I have referred my notes of the 29th of April to Mr. O'Brien, a stenographer, and his letter together with a corroborative letter from Mr. Bailey as to the date, is inclosed. Further proof of the correctness of the report will be found in an inclosed letter from Col. Fluney which, by permission, I send.

The Professor says he has a vivid recollection of this conversation. "It was Thursday," and he was "to leave the city on Saturday." As I remember, it was on Tuesday and the almanac substantiates that belief. As I was directed by the Commissioner to request the presence of Prof. Riley in his office on the day the newspaper men called, I cannot let Prof. R.'s statement go unchallenged. I was told by a clerk in his Division that he had been absent since 12 o'clock and so reported. Prof. Riley returned to the Department between 3 P.M and 4 P.M. on the day in question. The Prof. refers to Mr. Howard as knowing that he was present. Mr. Howard's letter explains that.

I desire to say, further, that the quotations from the conversations of Prof. Riley, used by the Commissioner in his communication, are true; that the said conversations were taken down at the time in short-hand; that the notes have been truly and faithfully transcribed and that they represent exactly what occurred. Prof. Riley has by his own acts and accord brought upon himself the stigma at present resting upon him, and I am sorry that in his endeavors to free himself from it, he has seen fit to characterize my work as "outrageously false" and thus compel me to enter into the controversy. C. D. LA DOW.

Being called upon by Mr. La Dow to substantiate the correctness of his transcript of certain stenographic notes contained within book No. 48 and appearing between two letters addressed respectively to Messrs. S. A. Mechon and Gen. Pope, I hereby certify to the correctness of said transcript

Respectfully,

E. V. O'BRIEN.

DEPARTMENT OF AGRICULTURE,
WASHINGTON, D. C., Feb. 18, 1880.

I hereby certify that upon an examination of the records of this Department I find on pages 121 and 152 of the Domestic Letter Book (1879) copies of letters to S. A. McMechen and Maj.-Gen. Jno. Pope, respectively, the former bearing date April 29th and the latter May 1st, both emanating from the Commissioner's office and presumably written from dictation.

JNO. L. BAILEY,
Clerk in charge of File Room.

U. S. DEPARTMENT OF AGRICULTURE,
WASHINGTON, D. C., Feb 5, 1880.

HON. WM. G. LE DUC, Commissioner of Agriculture: Sir—Your favor of this date covering "Vol. XXXIV, No. 5," of the RURAL NEW-YORKER, has been duly received.

I remember being at my desk in your office when the conversations between Professor Riley and yourself therein reported occurred.

While I cannot recall the exact language of these conversations, my distinct remembrance is that their general tenor has been truthfully conveyed in the newspaper account; my conviction of the accuracy of the report being strengthened by the clear impression left on my mind that there was a manifest desire upon the part of Prof. Riley to retain the position of Entomologist of the Department despite the equally manifest purpose on your part not to reinstate him. Very respectfully,

WM. W. FINNEY.

DEPARTMENT OF AGRICULTURE,
DIVISION OF ENTOMOLOGY,
WASHINGTON, D. C., Feb. 19, 1880.

MR C. D. LA DOW: Dear Sir—At your request I would state that Prof. Riley was mistaken in supposing that I am able to testify to his presence in his office between the hours of two and four on the afternoon of May 1st, 1879, and that his recent published statement to that effect was made without my knowledge. Prof. Riley may have been there or may not; I have no recollection whatever on that point. Yours truly, L. O. HOWARD.

[We presume the above will close the controversy. Certain it is we do not feel in duty bound to extend it without any limit.—EDS.].

SOME NEW JERSEY ORCHIDS.

NEW JERSEY is, *par excellence*, the Orchid State. The choicest of the North American species are found here, the rich peat soil and moist woods seeming to suit them admirably. One of the prettiest, though most retiring and inconspicuous, is the Goodyera pubescens. It is essentially a foliage Orchid, its tiny greenish-white flowers, being in no way remarkable. Its glaucous-green leaves are strongly reticulated with white, in the style of Fittonia argyroneura, which it somewhat resembles in habit. The Goodyera or Rattlesnake Plantain, to give it the common name, delights in the shadiest recesses of thick woods, and is not very frequently met with. It does so well in a cool greenhouse that I am surprised it is not seen more among temperate foliage plants, but it is not very well known. Another charming New Jersey Orchid is Calopogan pulchellus, or Grass Pink. Its delicate purplish-pink flowers are produced on long stems, and are not only beautiful, as its botanical name implies, but also very fragrant. It flowers in June and July, and is found in cold, peaty bogs all the way across from Maine to Minnesota, southward through Nebraska to Arkansas, but avoiding Kansas, and thence in a south-eastern direction to Florida. It is very rare in Western New York, and in many other places within the limits named. I have never seen this plant in cultivation, but it should do well in a temperate greenhouse.

Pogonia ophioglossoides, or Snake Mouth, is generally found in the neighborhood of the Calopogon, and its lively pink blossoms form a complete contrast to the green of the surrounding swamp, for this plant grows among sphagnum and sedges, so that those who do their collecting in patent-leather shoes generally must be contented to admire it from a distance. Orchids are singularly circumscribed in their geographical limits, but our present species, where it exists at all, is usually found in abundance. Sometimes a bog is perfectly ablaze with its rose-tinted blossoms. I have frequently seen this beautiful sight in New Jersey. The Pogonia is found from Canada west to Wisconsin, and southward to Florida. It flowers in June.

EMILY L. TAPLIN.

Literary Miscellany.

FOUR OLD MAIDS.

W. V. A.

(Continued from page 142.)

Olive came in last with a bounce and a giggle. She wore an old-fashioned barege dress that was severely plain in its makeup, and had plain linen bands at the neck and wrists. She also wore a wig of dull, dark red color, and parted exactly in the middle, combed back very plainly and smoothly and ending in a half dozen cork-screw curls that reached half way to her waist. She had padded a little here and a little there until her whole appearance was changed and she now appeared quite stoop-shouldered.

All four wore goggles of smoked glass that gave them quite an owlish appearance.

Mr. Browning burst into a loud hearty laugh, and Blanche, in as heavy a voice as she could assume, said:

"Mr. Browning, our landlord, I believe? Allow me, sir, to introduce myself as Miss Frederica Skidmore. This is my eldest sister, Miss Malvina. This Miss Melissa, and this Miss Arabella. We are happy to meet you, sir, and hope we shall agree about the rent, etc.

Mr. Browning rose with great dignity and ill-concealed mirth, and said:

"Certainly, certainly, ladies; allow me to welcome you to "The Retreat." Approaching Rose or Miss Malvina, rather, who had sunk into a large easy chair in a languid, feeble way he said: "I fear you have found your journey quite fatiguing."

"Yes," answered Miss Malvina in a faint, tremulous voice, "it was quite trying to my nerves, and I feel very much exhausted."

"Miss Melissa, I hope you have not suffered from the heat and dust. Did you not find them quite annoying?" he said addressing Margaret.

"Yes, I suppose they are very annoying," she replied in a high, sharp voice. "We have very few beetles in our State, and bugs one must tolerate from sheer necessity."

Here they all burst into a hearty fit of laughter, and, turning to Arabella, Mr. Browning said:

"I had no idea "The Retreat" was going to shelter such a charming young lady, or I should have preferred to remain and play host."

"O, sir, I am afraid you flatter me; I am so young and foolish you would be disappointed in me, I am sure." All this was said in a lisping, affected manner with most absurd poises and gestures intended to promote the idea of her girlishness, and she giggled after each sentence, thus making a most comical character.

The girls all screamed with laughter, while Uncle Tom actually held his fat sides.

"Well, girls, I must go. I want to catch the six o'clock train, see Lansing and request his folks to call on the Misses Skidmore. Good bye! Have a good time; and, Miss Arabella, have a care how you trifle with the hearts of the young men!"

With this, Mr. Browning took leave of the girls, and in a few minutes afterwards was walking briskly through the streets of the village, when he saw Harold Lansing and his wife approaching in a phaeton. Seeing Mr. Browning, they stopped and greeted him cordially:

"Why, Browning, what are doing down here? I thought you were off for Europe!" said Mr. Lansing after the usual exchange of polite greetings.

"We are going in a few days. I ran down this afternoon to escort some ladies who are going to occupy my house for a couple of months, not exactly as tenants, you know, they are four old maids who are relatives of mine. Any courtesies you and Mrs. Lansing may extend to them will be a favor conferred on me."

"We will try to call on them within a few days," said Mrs. Lansing.

"Thank you!" said Mr. Browning. "You will find them rather eccentric—something out of the ordinary line. For instance, they all have weak eyes, and at present are wearing goggles."

"O! you have excited my curiosity!" said Mrs. Lansing. "I dote on eccentric people, and you may be sure I will go over and see them. Good-bye! Bon voyage to yourself and Mrs. Browning!"

"Thanks! Good-bye!"

A few days after this, old Rachel carried Mrs. Lansing's card up stairs to where the Misses Skidmore were making their toilets.

"Tell the lady we will be down in a few moments," said Blanche. "Now, girls, the first time is always the hardest; but we must be dignified and not forget our parts. In the language of some unrecognized classic, we must 'face the music'!"

"Gracious! The first one who plays wrong will be walled up alive! just bear that in mind!" said Olive. Then, suddenly changing her manner, she said, "Sister Freddie, you go first, I'm so bashful!"

The girls all tittered; then Blanche looked stern and, ordering them to follow her without any more nonsense, they marched solemnly, single file to the handsome little reception room.

Mrs. Lansing gave a sudden start when she saw the four odd looking ladies enter the room; but, rising, she said, in her blandest tones, "The Misses Skidmore, I believe."

"Yes, madam; and we are happy to meet you, having heard our relative, Mr. Browning, speak of you," said Blanche. "I am Miss Frederica. This is our eldest sister, Miss Malvina; this is Melissa, and this is Arabella."

"A very pleasant day!" faintly suggested Miss Malvina.

"Yes, very pleasant;" said Mrs. Lansing.

"Is there much society in the neighborhood?" simpered and giggled Arabella. "You see my sisters are so much older than I that I find it very dull here."

"How silly you are, Arabella!" said Frederica, sternly.

"Now, sister, don't crush my young and joyous spirit!" retorted Arabella, with a most ridiculous attempt at a childish pout.

Mrs. Lansing was very much amused—so much so that she could not repress a smile as she replied: "The society is not large, but it is very pleasant. I expect to have my house quite filled with young people next week; and, as you are our nearest neighbors, I hope we can make it more pleasant for you."

"O, how sweet!" exclaimed Arabella, with clasped hands. "Sister, do you hear that?" turning to Melissa with a stiff, quick movement, that was intended to be very pretty and childish.

"What!" said Melissa, in her sharp voice, "my ears lap, hey? You are getting very rude, Arabella!"

"O, dear!" sighed Arabella. Then suddenly putting her mouth to Melissa's ear, she shouted, "I didn't say that. I asked you if you heard what Mrs. Lansing said. She is going to have her house full of young people next week."

"O! I misunderstood you," said Melissa.

Mrs. Lansing took a chair at her side, and said in a loud voice and quite close to her ear, "You have quite an affliction; it is very sad."

"Yes, she is very affectionate, and that is not bad," said Melissa.

Here Blanche yelled into her other ear what Mrs. Lansing had said; and she, turning to Mrs. Lansing, talked to a great length about how long she had been deaf, the cause of it and other tedious subjects. At length Melissa paused, out of breath, and, turning to Malvina, Mrs. Lansing said:

"You look quite delicate, Miss Skidmore. I trust the pure country air will prove beneficial to you."

"Thank you! I am sure" quavered Malvina, but I don't think there is much hope for me. My physician thinks my lungs are affected; my heart troubles me at times, and I am just recovering from a severe attack of neuralgia. I am very delicate—very delicate indeed."

"O, you must not be so hopeless! It is always best to look on the brightest side," replied Mrs. Lansing. "Should you stand in need of a physician during your stay here, let me recommend my special favorite, Dr. Wall."

"Have you no female physician here?" inquired Blanche. I should prefer her if there is. Women who are educated to the profession understand it better than the men. I wonder that more of them do not enter the professions. They have better heads than the men, and could carry out their ideas a great deal better than the so-called "lords of creation."

"There is no female physician in the village; but I believe there are several in M———" said Mrs. Lansing.

"O, sister Freddie is so strong-minded!" simpered Arabella.

"Pity you were not a little more so!" snapped Frederica.

"I really must go," said Mrs. Lansing, rising; "but I hope to have the pleasure of meeting you all in my own house quite soon. Pray, don't be ceremonious, for the summer will soon be gone." Turning to Melissa, she said quite loudly, "I want you and your sisters to come and see me quite often and be real neighborly."

"Thanks!" said Melissa. "We shall be glad to have you come often and be neighborly. You are very kind, indeed."

"Dear, dear!" said Arabella in affected distress, "she has misunderstood you again."

"O! well; let it pass," said Mrs. Lansing, and bidding them good-day, she was soon on her way home, highly amused with those "queer, old maids."

Next week brought the young ladies and gentlemen that Olive had told the "clan" were going to visit the Lansings. They were a gay party. First were the Lansing girls, Julia and Clara, two handsome, stylish, but rather affected girls; Robert Lansing, their brother, a handsome blonde and a rising young lawyer, a good, honest, open-hearted fellow, without a bit of affectation; Lance Stedman, a tall, slim gentleman, with dark hair and sharp, keen, black eyes, rather reticent, but a quick observer, very gentlemanly and possessed of ample means; his sister Laura, not much of a beauty, but very fascinating and a great favorite with the gentlemen; his "royal highness," Hugh Enders, to quote Olive's words, "a splendid looking specimen of the genus homo," with his six feet of well-proportioned bone and muscle, deep, dark blue eyes, brown curly hair, and short, crisp, brown beard, and last, the gentleman whom Olive had designated as "that conceited simpleton," Edgar Faras. He was only a few inches taller than Olive, with the "blackest hair and eyes," as some of the girls described him; dark, swarthy skin; glittering white teeth, and a figure rather broad, but otherwise well-proportioned. He was decidedly handsome; full of fun, and was far from being a conceited simpleton, and Miss Olive was far from thinking him so; but then, girls are contrary, you know!

I think the fact that these four young gentlemen were to visit the Lansings, had more to do with the "clan" visiting M—— than either of the girls would have acknowledged, even to herself. The four gentlemen were great friends—"inseparables" some said, and when they fell into the way of escorting the "clan" to parties, &c., people thought it was "quite odd," "so queer," and some said "a double clan." Each gentleman showed a decided preference for a particular member of the "clan," and the girls seemed very well satisfied with the gentlemen's preferences. Edgar Faras was Olive's devoted slave, but she was critical, merciless and changeable, and he would take solemn oaths never to visit her again, and to be very cold and unfriendly at their next meeting, but when that next meeting came and Olive would greet him with outstretched hands and tell him she hadn't seen him for an age and ask why he hadn't been to see her was he ill? He would immediately dissolve his indignation into a hearty handshake and gay words of banter, and in less than ten minutes make an engagement to call upon her, and in an hour or so afterwards, as he walked home, he would grit his teeth and call himself "a —— fool!"——

It was not long after this that the young people went in a body to call on the Misses Skidmore, and Edgar Faras and Rob Lansing seated on either side of Arabella, vied with each other in playing devoted to that young lady. Faras wanted to take her out for a drive; but no, "Sister Freddie will never consent." Then Lansing wanted the privilege of calling and spending an evening with her; but "sister Malvina thinks I'm too young yet to receive gentlemen callers."

"Ye gods!" said Lansing the next chance he got to speak to Faras alone. "did you hear that old maid say that her sister thought she was too young to receive gentlemen callers? I thought I should explode!"

One morning Faras was waiting for old George, a negro hostler of Lansing's, to saddle a horse for him and while he waited, they discussed the merits of the different horses in the stable. Presently old George said, "Dem is mighty spry old ladies ober to Massa Browning's place! Orter see 'em riding horseback out in de meddar and lafin and runnin like wild! Wouldn't think it to see 'em settin' so straight and quiet like in de kerridge neber smilin' eben. Don't look like old folks when da is down in de meddar! Eben de rite ole one wid sich, wite har and is so mighty pale and sick lookin'—why, sah, she kin run and climb ober a big rail fence quick'n I kin!"

All at once a suspicion flashed into Faras's mind but he turned to old George and said quite carelessly, "O, well, George, they are quite queer folks I know, but you had better not say anything to anybody else about it, for Mr. Lansing would not like it. Here is a quarter for your trouble." And mounting his horse he rode away.

This was before breakfast, and after breakfast Faras strolled off down the orchard alone; but once out of sight of the house he walked off briskly towards a piece of woods on the other side of which was Mr. Browning's meadow, which Faras soon reached, but to his disappointment there was no one in sight. Following the fence he soon reached the Browning orchard through which he passed to the tall green hedge which separated the orchard from the handsome grounds which surrounded the residence. He was standing behind this hedge, and mentally berating himself for "playing sneak," when a sound of gay laughter was wafted to him by the wind, and peering through the hedge he saw, not the four Misses Skidmore, but "'The Clan,' by Jove!"

"O, sisters," said Olive with Arabella's voice and gestures, "don't break my young heart! I beseech you to soften your hearts toward me, and we will bless you all our days—my beloved Edgar and I!"

Here the rest of the girls burst into shrieks of laughter in which Olive joined, and the gentleman behind the hedge had hard work to preserve his gravity. As it was, his face flushed and he said, *sotto voce*, "All right, Miss Arabella! 'All's well that ends well!'"

The girls passed out of sight and hearing, and Faras was soon back on the Lansing place. The joke was too good to keep, and his morning adventure was soon related to Enders, Stedman and Lansing. Astonishment and merriment reigned supreme for a while, and then Rob Lansing said, "By George, boys, we must checkmate them!"

"Agreed!"

"Good!"

"Let us have some fun at their expense;"

"I'll tell you my role, boys," said Faras. "I am going to engage myself to the charming Arabella, and elope with her!"

"Hurrah!" shouted Lansing. "But I say why can't the rest of us follow suit?"

"O, they would suspect us immediately," said Enders. The best thing we can do is to help Faras."

In the course of two weeks they had carried out their plan so well that Arabella was engaged to her "beloved Edgar" and had promised to "fly" with him, for she told him it would be useless to speak to her sisters for they were opposed to her receiving his attentions and scolded her severely for showing a preference for his society.

There was great merriment amongst the "Clan" when Olive showed them Faras's ring and told them of her engagement.

"O, Olive! it will be such fun to elope with him and take off your goggles and wig after he is safely 'hooked'!" said Blanche.

"Just what I intend to do!" said Olive with a merry laugh; then suddenly, with flushed cheeks and an angry stamp of the foot, "I shall do nothing of the kind! so, there!"

"Well I don't make a snapping-turtle of yourself!" said Blanche.

"Girls, I wish you had a little sympathy and feeling for me. You are all just too hateful!" said Olive, petlishly and with tears in her eyes.

"Why, what's the matter!" said Rose, "I am sure I have not been 'hateful, and I have plenty of feeling for you."

"O, come, Olive; don't be a stupid old goose nor a snapping-turtle either!" said Margaret. "How were we to advise or sympathize with you until we knew you wanted either? I was planning up something while you were giving us a sample of your amiability: What day have you and your 'adored one' appointed to 'fly' on the 'wings of love' versus a railroad car?"

"Next Tuesday," sullenly answered Olive.

"Well, don't you see how easily we could pack up and leave on Saturday, while the Lansing crowd are gone on that trip up the river? And then Jerry could go over in the evening and deliver a note to Faras, in which you could say that all was discovered, and that your cruel sisters had hurried you off and you had no idea where they were taking you, that your heart was broken, &c.!"

Olive made a sudden spring and threw both arms around Magaret as the latter finished speaking and half smothered her with kisses, saying, "Margaret, thou art indeed a pearl!"

"With the exception of being 'just too hateful!' said Margaret, with a laugh.

"But where shall we go to?" inquired Blanche. "We can't go home just yet."

"O, we can go to B—— and pay old Aunt Cordy a visit. She would be 'mightily pleased to see ye gals!'" said Margaret.

"That's so! and just the place for us!" said Rose.

I have read somewhere that——

"Man proposes;
God disposes."

But in the case of the "clan" it was woman who proposed and man who disposed, for on Friday night when the Misses Skidmore's trunks were all packed and Arabella's note to Faras sealed and directed, the four gentlemen so often mentioned in this story disposed of all the plans they had proposed. It happened in this wise: Faras persuaded his three friends to go with him and spend the evening with the Misses Skidmore, as he said he would not dare to go alone, and otherwise he should not be able to see his affianced for several days. A very innocent proposition, but it effectually disposed of several propositions.

It had been a dull, gloomy day; sultry with sudden gusts of wind, and late in the afternoon threatening clouds appeared, that culminated just at dusk in a slow, drizzling rain, that bid fair (foul) to last far into the night.

The Misses Skidmore had spent a dull, tedious afternoon, and when Rachel came in with the lamps and told them that it was raining, Olive sprang up and said, "Come, girls, let us have some music and a jolly, good time! No danger of callers to-night, and so we will have a minstrel troupe. Blanche and I will be the 'end men;' Margie will be 'middle man,' and Rose will be the audience!"

"Good!"

"Splendid!"

"Agreed!" said the other three girls, and forthwith the fun commenced.

In the meantime Faras and his friends, nothing daunted, sallied forth under the protection of umbrellas. Arrived at the retreat, Enders was in the act of ringing the bell when Faras suddenly restrained him. The entrance door was slightly ajar, and from within came the sound of music and laughter. Faras boldly pushed the door open, and silently followed by his companions, entered the hall and walked to the parlor door and gazed in upon a strange sight.

The feeble Miss Malvina was seated in a most ridiculous attitude at the piano playing an old-fashioned negro medley with an effect neither soft nor gentle, while Miss Frederica, whose upper lip was adorned with a moustache (produced by a few touches of burnt cork), was singing in a loud, masculine manner, the words of the melody Miss Malvina was playing. At the other end of the piano stood the romantic Miss Arabella with a violin from which she was drawing the most dismal and discordant sounds. In the center of the room was Miss Melissa, with her arms extended and her hands daintily holding up her skirts on either side, displaying a pair of slippered feet that were keeping time to the lively music, while her cheeks were flushed and her cap-strings flying wildly about.

Margaret Doan and Hugh Enders were engaged, and she had promised that when the golden rods bloomed again she would become his wife. When he told her of his invitation from the Lansings, she, to his surprise, insisted on his accepting it, as she was going with the "clan" to some "out-of-the-way" place in the country, and that he might as well go and enjoy himself.

"But, Darling," said he, "it would be such a bore, and I shall be expected to play the devoted to some of those girls."

"O, well, Hugh, I can trust you, dear; and perhaps it will not be such a bore, and if it is you need not stay; you can make some excuse and leave."

Hugh did not wish to accept the invitation, but, as Margaret insisted and as the engagement between himself and Margaret was still a secret, he finally concluded to go.

Robert Lansing and Rose Sheldon were a most devoted couple, and rumor said they were engaged, but as yet there was no engagement existing between them, though it looked much as though there soon would be.

Lance Stedman was Blanche's constant attendant, and in spite of his reticence and grave ways, she loved him with her whole heart and felt confident that he loved her, though he had never told her so in plain words.

The next afternoon, after the arrival of the Lansing guests, Olive made an excuse to send old Jerry to the village, and when he returned, she asked him if he saw any of the company at the Lansing's.

"Yes, Miss; they is all out on the lawn playing croquette."

As he was passing around the corner of the house, Olive called out, "O, Jerry! I almost forgot; we want to take a drive in the open carriage. Please get it ready immediately, and be sure and put on your tall hat."

Three flushed faces confronted her as she entered the door: "O, Olive!" cried the girls, "we can't!"

"You silly old geese! come right up stairs this minute and get dressed! It will break the ice a little, for next week we must return Mrs. Lansing's call."

A half hour afterward the Misses Skidmore were being driven at a slow, dignified pace along the road that led past Lansing's. Miss Malvina partially reclined on a pile of rich cushions and pillows. She was dressed in sombre black which brought out her gray puffs and pale face, for she was now quite pale from excitement. Melissa also wore black, but it was relieved by an antique-shaped bonnet of white straw trimmed with purple ribbon and white flowers. Fredericka sat on the front seat very straight and dignified. She wore a black derby hat with a brown wing fastened at one side, and a dress of brown lawn made severely plain and old-fashioned. Arabella wore a white dress very much ruffled and very short, with a blue sash tied around her waist in regular baby style. On her head was a marvel of millinery art composed of blue silk, satin and lace. It was very fine and stylish, but too small for her head, and evidently suitable only for a very young Miss. She also wore an immense blue bow at her throat, lavender gloves on her hands, and carried a huge fan. The hat belonged to one of her younger sisters, and when the other girls recognized it, and asked her how she came by it, she said, with great merriment: "O, it was just what I wanted, so I helped myself to it! Papa can buy her another one; but won't there be a storm when I take it home! It won't do much good, though, for by that time I shall have had my fun and the scolding can't take it away!"

As they drove past Lansing's, there was a sudden hush and whispering among the gay party on the lawn, and all eyes were turned toward the Misses Skidmore who, amid the profound silence, drove solemnly past. Not one of either party stirred, with the exception of Arabella, whose face, which was now a fiery red, was suddenly averted, but she turned it as quickly again and looked back at the party on the lawn and held her fan before her face in mock bashfulness. It was a splendid little bit of acting and was well appreciated by her audience.

There was great laughter and merriment among the young people on the lawn as soon as the carriage was out of hearing, and a great deal of coughing and suppressed laughter among the Misses Skidmore.

They rode out every pleasant afternoon after that and always passed the Lansing place, and nearly always saw some of the guests.

Finally, one pleasant morning they decided to return Mrs. Lansing's call, and were soon on their way. Malvina wore her customary black, with the addition of a long crape veil. Melissa wore her gray silk dress; her white bonnet trimmed with purple and white, and an old fashioned black lace shawl draped around her. Fredericka wore a scant brown silk with a half fitting sacque and plain linen collar and cuffs. Her skirt was short, with no overdress. Her sleeves were short and she wore one-button kid gloves that were a size too large for her hands. On her head she wore the black derby hat with the brown wing that she always appeared in. But Arabella carried off the honors, arrayed in a sky-blue silk dress that her mother had worn when she was a girl, and of course quite out of style now; on her head a broad white leghorn hat with a wreath of pink and white roses encircling the crown; flesh tinted gloves that were too large on her hands; a short white lace sacque with flowing sleeves, and a whole set of cameos in antique settings, the sight of which on her would almost have caused her mother to faint, for she valued them as precious keepsakes. After they had enjoyed a hearty laugh at each others comical appearance, they proceeded demurely to the carriage and were soon standing at Mrs. Lansing's door.

They were shown into the reception room, and Mrs. Lansing soon appeared and cordially greeted them. In a few minutes after, Julia and Clara Lansing appeared and were introduced to the Misses Skidmore. They sat down near Arabella and entered into conversation with her.

"Are you fond of croquette?" asked Julia.

"O, Yes! it is so sweet!" giggled Arabella.

"I suppose then that you and your sisters play a great deal?" said Clara.

"O, no, indeed!" sighed Arabella, with clasped hands, "my sisters are so much older than I am that they have very little sympathy with me. I am so full of youth and spirits that it is very dull for me sometimes."

All this was said with an accompaniment of giggles, sighs and jerky movements, that caused her to appear extremely riduculous. And had not the Misses Lansing been well-bred young ladies they would have indulged in a hearty laugh then and there.

In the meantime Mrs. Lansing had prevailed on Fredericka and Malvina to remain to lunch which would soon be served.

"Arabella," said Fredericka, "Mrs. Lansing has kindly invited us to remain to lunch, and your sister and I have accepted."

This was—to use a slang phrase—a stunner, and Arabella was so startled that she awkwardly dropped her fan, half rose from her seat, but sat down with a very red face, and said, with great gush, "O, Freddie! how sweet!"

"Fredericka, had you not better ascertain if Melissa wishes to remain?" faintly suggested Malvina.—[To be continued.

For Women.

CONDUCTED BY MISS RAY CLARK.

THE FARMER'S DAUGHTER.

BY ANNIE L. JACK.

She dwelt within a quiet home,
No model of the graces,
Unknown to culture's higher walks,
Or fashion's giddy places.
A thoughtful girl, so sweet, so wise,
With earnest face and deep grey eyes
The farmer's gentle daughter.

From morn till eve the little maid
Is busy at her labor;
She sweeps and dusts, and feeds the hens,
And never minds her neighbor;
No gossip ever listens to,
(A merit rare 'tween me and you),
Thus lives the farmer's daughter.

On baking days her tiny hands
Are skillful at the making;
No bread more light and sweet than her's
Was ever made by baking.
She churns the butter, golden, sweet,
And keeps the dairy clean and neat,
This busy farmer's daughter,

Her garden is an Eden fair,
A-bloom with pinks and roses;
She knows the name of every flower
And makes some gorgeous posies.
Grows peas and radishes, and cress,
And corn and squash and herbs to press,
This happy farmer's daughter.

Long may she bravely smile on us,
Our darling household fairy,
The queen of garden, house, and lot
And princess of the dairy:
To teach us by her pleasant way
To love the things of "every day,"
God bless the farmer's daughter.

AN EXPLANATION.

The letter in our last issue from Mrs. J. E. S.—for which thanks are tendered—has suggested the necessity of a few words of explanation:

It was not, and is not now, the intention to sacrifice the "Department for Women," but owing to the great press of matter for all departments, a deviation from the usual course was absolutely necessary. Occasional raids may be made in the woman's kingdom, but the foe is not to conquer the entire possession. Be of good cheer, "Rural" sisters, and kindly exercise a little forbearance.

R. C.

A REQUEST.

Will Margaret B. Harvey, whose love for Art has rendered her acquainted with the works of the great masters, give to her "Rural" sisters—whose knowledge is more limited—the subjects of some of the finest large steel engravings?

Mrs. S. H.

"BITS OF EXPERIENCE."

VELENA.

Reading the above heading in a mechanical paper, it struck me so forcibly that I have concluded to borrow it and relate a few of my own daily experiences.

Some seven years ago my husband and myself, owing to circumstances and a change of residence, concluded to break up housekeeping and board. Last spring, however, we decided to return to our native town and settle under our own roof, with our feet under our own table. Although somewhat out of practice, it was not difficult to again "bake and brew," sweep, dust, etc., as every housekeeper has more or less of it to do. It, however, was decided upon to have a good pair of strong arms to do the bulk of the work, while I was to oversee the household generally and to do the planning. Wise heads were shaken in a meaning way, but nothing daunted, we engaged a strong Irish Mary to do the whole of the work, well and quietly, "and to be in nights." I was to pay her the first of every month for the last month's work. Knowing that she had been out to service for several years, I said to her that the dishes in such a cupboard were for daily use, and she was to set the table, having things convenient, in order, and to make them look the best it was possible to every time. Everything was to be done well, and the best was to be made of everything that was provided for her. As a general thing I would do the marketing.

Well! She began, and I began! It was, "Will yez be afther telling me how yez would have the loike of that?" in a high, strained tone, fairly making the ear tingle. Said I, quietly, "Do it, Mary, the *best* you can, and if it does not suit I will tell you what changes to make. If you do it well and do it differently from my way, I will learn, but if I have you change it, you will be the one who learns." This seemed rather to please her, and I think it gave her a certain pride that tended toward doing everything well. But, of course, I am obliged to firmly and quietly attend to things daily. For instance, the first time she made bread it was very good, but had a little too much yeast, and so I told her. The next time it was excellent, and I said to her I hoped she would make it as good every time. Several weeks after followed good bread, then it began to be poorer and then a little worse. I said to her that something was wrong and we must find out what. She assured me that she had tried hard but it was her luck. Looking into the matter I found the barrel had been stood in the pantry on the floor just over the cistern and the flour was damp. Mary was told to take the barrel into the kitchen, take out the flour and dry it and dry the barrel thoroughly; then put the flour in again and find a dry place for the flour-barrel. Having given my instructions, I went into another part of the house to do some work of quite a different kind. The next day, making inquiries, I found Mary had the flour and barrel as "dhry as dhry could be," and had put the flour-barrel into the kitchen chamber, away from the dust and damp. Since then we have had excellent bread again.

I can hardly leave this without a comment, that is, with all mechanical skill and with all our strength we must use a little brains in running a house economically and well. There was a cause, the cause was not that she was careless, but in this case it was the dampness that had introduced itself so subtlely that neither her instinct nor her knowledge had as yet fathomed it. It was not damp enough to be seen but my hands being sensitive, I could feel it, and although it might have been questioned whether there really was enough to have any effect, the drying of the flour proved there was. She knew as well as I did that damp flour would not make good bread, but she had not found out that her flour was just damp enough to prevent her bread being good. Had I taken the matter in hand in a different manner there probably would have been quite a different result. The Irish are faithful and true when they once realize that you are upright and just to them and to yourself; but they are of a flashy temperament and must be dealt with "cool and firm." When one finds things awry it may be difficult to appear calm, especially if one happens to be at a white heat; however, if you forget but for a moment and lose your temper in a loose tongue you will soon learn that you have lost a good name with it, also the respect of your maid-of-all-work and feel a rankling in your mind that lessens even your own good opinion of yourself. In other words you find yourself feeling very uncomfortable and no good coming of it. This leads to the "servant" subject upon which we see so much written about. There are two sides to it, namely, those who hire and those who are hired. Both have a story. However, so far as my observation and experience goes it is want of tact in managing that is lacking the most. As a general thing we do not hire until necessity compels us to, then there is so much to be done that our mind becomes flustered, our plans are only half made, things generally are muddled and we get nervous and out of temper, and our help is so "rolled that it is no use trying to do anything." Every one cannot go into a strange place and work to advantage the first few days. And a girl who has to work out for a living cannot come to you or me and take the bulk of our accumulated work and do it in a few days, or possibly, weeks, then go to another place, and so on the year round. They must work steadily, and must not overwork, else they break down, and who will then care for "Mary?" Certainly not the one who exacted the most drudging of her. Then, too, the girl's former life ought, in a degree, to be taken into account, her own home may be little better than a hovel, there may have been no teaching to make her thoughtful and industrious, no ways, no means, of showing her how to do the very things most households require to have done every day. Insist on a servant being kind and willing; with these two elements almost every woman can with time and tact secure valuable help.

FASHION NOTES.

The fancy for dressing the throat as closely and high as possible is again revived. Thick ruchings of crepe lisse and light lace worn in the dress, sometimes above the collar or plaiting, or on the outside of them. The quilled lace is frequently doubled, the plain edges meeting in a seam which its fullness conceals, and a tiny bunch of flowers nestles in its folds at one side.

Misses wear Derby felt hats for every day, or else sealskin toques or turbans. Fanciful silk, satins, or velvet turbans are for better wear, also Pinafore hats with plaited satin in the brim. Felt toques with beaver borders in quaint bowl shape are trimmed on top with a gay satin bow for smaller girls, while the very smallest wear cap bonnets of velvet or of quilted satin and lace, also fancy turbans.

Large collars appear on all handsome dresses for children, and round shapes are taking the place of square ones.

Young ladies wear their corsage bouquets on one side of the neck, near the shoulder.

Dinner cards of sandal-wood are the newest. They are highly elegant and expensive.

Black kid gloves are the most popular for dress occasions, because they make the hand look small and shapely.

Black satin walking skirts have no trimming whatever. Their elegance is in their simplicity.

Broad soled shoes are the newest. They have a double row of buttons on the outside, and are very showy.

One by one brides discard the old fashioned white satin.

Plush collars and cuffs will be much worn on early spring dresses and wraps.

In many of the new designs, both imported and domestic, cords of gold or silver thread and silk are much used. Skirts of tulle and gauze are looped with them, and they are used as a sort of frame or setting for bunches of flowers which decorate ball dresses. Very fine cords are even used for trimming sleeves, berthas and the coiffure.

The fashion of a corsage different from the dress will prevail in the spring. Long corsages of material and color different from the skirt will be worn both in the house and on the street, and later when the weather is warmer without any wrap.

For fine white handkerchiefs hemstitching in blocks on the hem and needle-worked scallops are shown, also the frilled handkerchiefs with one or two ruffles laid in fine plaitings, and overcast in saw-tooth notches.

In spring the polonaise will be generally revived. Its composition will be somewhat changed, but it will be the polonaise again. Princess dresses will be worn also, but with certain changes.

Young girls mass their hair at the back in a thick cluster of curls, or they roll it round in the large soft Grecian plait, and stick a dagger through it, or put an arrow across it.

The fashionable stationery for ladies at present is the heavy English paper in place of the thin French paper that has been so long in vogue.

Among the new fancies for buttons are twin mice of dull silver, owls—the most fashionable of birds just now—and lady birds of red enamel.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN-THOUGHTS FROM EVERY-DAY HOUSE.

MRS. ANNIE L. JACK.

Our hens have been very well behaved this winter, and kept us supplied with eggs. We attribute it to a constant supply of buckwheat, scraps from the kitchen, and plenty of water slightly warm, also to a corner of the hen-house being kept layered with coal ashes and cracked oyster shells, with all the scrapings of lime and sand we could get. I had packed away in the fall a supply of eggs that we find quite fresh. They were simply placed in a box with salt, beginning at the bottom with a layer of eggs, small end down, then one salt, then another of eggs, and again salt, and so on till the box was full. They will keep a year if so placed, and the salt can be used successive seasons. For breakfast, when tired of eggs boiled, fried and poached, we try the omelet here given, by way of variety:—

Four eggs well beaten, to which is added a cup of milk into which has been stirred one tablespoonful of cracker well rolled and a small teaspoonful of flour. Stir well together just before pouring on to the buttered griddle, which must be hot but not *too* hot. Turn when it is well set all round the edge, fold it into four thicknesses, and turn upon a hot plate. The children are fond of this omelet and it is light and not unwholesome.

I think the latter part of winter the most difficult in all housekeepers' experience, in providing variety for the family table, especially when eggs and milk become scarce, as is often the case. It is at this time that the store of preserves comes into requisition and a bottle of canned fruit eaten with warm biscuit, is as nice as any pudding for dessert. A very nice pudding, when milk is not plentiful, is made by chopping beef suet finely, mixing with flour in which a little baking powder has been mixed dry. Then moisten with water to a *rolling* consistency; spread with black currant jam; roll up, being careful to close the ends. Then roll it up in the pudding-cloth, tie, and put into boiling water. Boil two hours. It is very good.

A very simple variety is made by putting a cupful of rice into a pudding-bag, leaving room for it to swell to three times its size when tying up. Boiled two hours and then eaten with any sweet sauce, it is a very wholesome dessert, for young people especially, whose meat-eating propensities have sometimes to be restrained, but whose hunger must be satisfied. What a time it takes to prepare the three meals a day that must be ready when the time comes! And yet we know it is part of our duty, and the more cheerfully we agree to its importance, the better it will be for all the family circle, for

"Never, never, oh never, earth's luckiest sinner
Hath unpunished forgotten the hour of his dinner."

"AN EVERY-DAY DINNER."

ADELINE E. STORY.

Now that it has become a custom for every village butcher to send out wagons in every direction with fresh mutton, beef and veal, there is scarcely a farmer in the more thickly settled portions of the country, who may not have fresh meat for his table at least three days in the week during the warm months and that is when he wants it most, for through the winter he has had of sausage a plenty with beef of his own fatting and killing kept fresh for weeks by being packed closely in snow and allowed to freeze.

With the butcher's boy blowing his horn every other day before her door, and a good garden at her back, rich, golden butter and cream in her cellar, fruit fresh and luscious ready to drop into her hands, with promise on every side of "more to follow," the country housewife of all housewives in the world, may be said to stand in clover. She may any day spread her board with a dinner fit for an emperor, and if she will place a few fresh flowers in the center, the eye as well as the palate will be pleased. It is not so easy to prepare a meal in winter.

Here is one, however, which "our folks" have just pronounced "as good as need be.' Bread, light, crisp and flaky made from home-made yeast and butter—we never think of calling good, fresh butter unwholesome at our house. A loin of mutton baked. It was first prepared by seasoning with salt and pepper, then dredged with flour to form a crust to "keep in the sweetness." With this we had canned tomatoes stewed slowly half an hour with a little butter pepper and salt; potatoes and turnips well mashed and flavored with salt and cream. We prefer the kohl-rabi to the turnip earlier in the season, but it seems to grow stringy with age. For dessert we had apples cut in halves after being pared, and baked with a lump of butter the size of a hazel nut and a teaspoonful of sugar put in the hollow made by "scooping" out the core, a little water was added to the bake-dish and turned on the apples when taken up. This was eaten warm. That was the dinner, plain but substantial and to hungry workers, appetizing. Below I give the recipe for a pudding which is a favorite at our house, also my way of making yeast.

Batter Pudding.

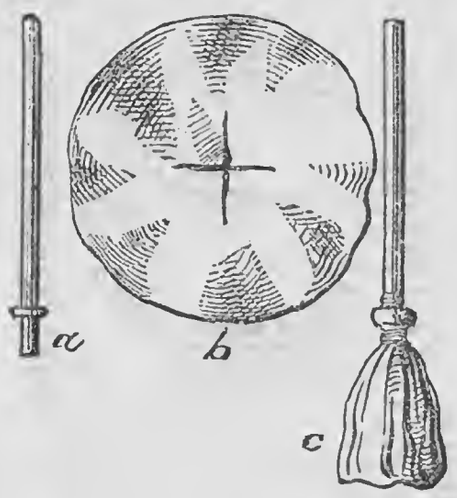
Two eggs well beaten; one pint butter-milk; one tablespoonful sour cream; a rounding teaspoonful of soda; a little salt and flour to make a mass so stiff that it would keep the shape of a very rough mountain if made into one. Stir in ripe berries, cherries or currants—or in the absence of these, the dried fruit—till they are as close together as the stars in the Milky Way look to be. Steam two hours. Serve with cream—not the mixture of milk and yelk of eggs used by city housewives—and sugar to which a little nutmeg may be added.

Yeast.

Boil six medium-sized potatoes, cut in halves, in three pints of water with a handful of hops tied in a cloth. Have ready in a pan a cup of flour. When the potatoes are done, turn the water scalding hot through a colander onto the flour, stirring it until smooth. Mash the potatoes through the colander and when luke-warm add a cup of good yeast.

How to Make a Dish-Mop.

Take a round stick and put an iron washer on it two inches from the lower end, making it fit tightly: a. Take a round piece of cloth,—a worn-out woven undershirt is the best material—about 16 or 18 inches in diameter;



cut a cross in the center large enough to put the handle through, b; put it over the handle, tie the corner of the cross-cut above the washer, wrapping several times with twine or copper wire, as a paint brush is wrapped. Bring the cloth down and tie again and wrap it below the washer. The cloth may be cut into strips if desired, c. H. S.

THE CANNING OF TOMATOES.

I have been reading the article on canning tomatoes, in the number of February 14th, and although not, perhaps, an experienced housekeeper, I have been successful the last three years in putting up tomatoes. I use only the Mason improved jar. I have had the jar Mary Wager-Fisher speaks of as the "Whitall" or "Melville," and could I get them, would never want any other. In Albany, N. Y., where I have inquired, they are not kept, and the Mason seems to be the only, or rather the next best. All my cans that have been opened thus far, have been as nice as fresh tomatoes in summer. They are kept in a cellar which is cold—for it is desirable to have the cellar as cool as may be, without freezing—but it is not dark by any means. With me, the way of putting up the tomatoes has something to do with their keeping. I have tried various ways, but have been the best satisfied in every respect with the following:—After scalding and taking the skin from the tomatoes, I cut them into pieces as large as I can push into the jar, and fill the latter full. Then, having my wash-boiler ready with cold water to the depth of one-third of the jars after they are in, and pieces of grate at the bottom to keep the jars from breaking, I put on the rubber ring and the glass top and set in as many jars side by side without touching, as the boiler will hold. After the water comes to the boiling point, I let the tomatoes boil fifteen minutes, then if any jars are not quite full, I use the contents of one to fill the others. I take one out at a time, put on the metal band as quickly as possible, and after they are cool, put them in the cellar, where they stand until wanted for use. I think, in general, tomatoes are cooked too much. It seems to give them an unnatural and unusually acid taste. Even in making catsup, I only cook the tomatoes until done; say a half hour, then putting them *carefully* in a sieve, the water that first runs through is thrown away, then after rubbing the rest through and adding the seasoning, the mass needs only to be thoroughly scalded, and it is ready to be put away. I have kept it until June, with only a good cork in the bottle, as nice as any one could wish, except that some would want more seasoning than any of us care for. MRS. W. F. A.

ACID TOMATOES; GLASS FRUIT CANS.

If Mary Wager-Fisher is not opposed to the use of condiments, she can utilize her soured tomatoes by making catsup of them, of which I could supply her with a "gem" of a recipe; but before doing so I would advise her in cooking them for the table, to put in a slight pinch of baking soda and a dessert-spoonful of sugar to each quart. I learned from a colored cook to do this during the growing season, when frequent rains produce acidity in that luscious fruit.

My experience with tin *versus* glass is in favor of the latter for everything. Several years ago, I had a like experience to hers. For two years past I have experimented with both, and find that, if kept in a *dark, dry* closet, those in glass are more apt to preserve in the perfect degree the natural flavor of the fruit. From careful observation I am inclined to attribute the tendency to sour to the ripening of the tomato at an unfavorable season.

Speaking of cans, the *bona fide* "Mason" is always in three pieces—the glass jars, rubber ring, and porcelain-lined, *zinc* top. In my opinion they are superior to any other kind, and 'tis only because our little Southern town has not kept them always that I am possessed of so many useless, or comparatively so, "Gems," "Queens," "Melvilles," etc.,—all these latter have the glass-lid, metal-ring arrangement, the latter loosening its fit after a season or two's use. The Mason has a thicker rubber and a distinct ledge around the band; thus by renewing the former when it loses its elasticity, I think the jars can be used many years. I always test them by turning each upside-down with the hot fruit in it. E. G. S.

(Please give the recipe. E. M.)

"BITS OF EXPERIENCE" IN CANNING TOMATOES.

Last fall I selected good, fair tomatoes—not too ripe—and prepared them in the usual way for canning; when ready to put in the cans, about a teaspoonful of table salt was allowed to each can and stirred thoroughly in the prepared tomatoes, which were then put in glass cans and the covers put on. After allowing the cans to "cool off" the covers were tightened and the cans taken down cellar and placed upside-down on a swing-shelf. So far as they have been used during the winter they are as perfect, canned tomatoes as one ever ate.

The cans were the "Gem;" my reason for using them was because I had them. The tomatoes were selected "not to ripe" for when the fruit is too ripe fermentation takes place and acidity is the result. The cans were placed upside down so as to allow the liquid to run out, at once, should they fail to be (or to get) air-tight. Such cans are thus easily detected and can be readily removed. The cellar is an ordinarily good one, not too warm and never freezing. MRS. J. E.

Miscellaneous.

BRIEFLETS.

Artemus Ward said: "Vanity makes young men on fearfully small salaries wear store-clothes every day and neglect to pay their washerwoman. Vanity makes young women ignore the wash-tub, the cook-stove, the garden, and other health-giving institutions of a like character. Vanity makes men whom Nature expressly designed for tin-peddlers, haberdashers and horse-dealers, aspire to be statesmen." . . . Alternantheras, Cineraria maritima, Glaucium, Achyranthes and Coleus, with the Bronze Ricinus or Cannas and Caladiums in the center, make showy beds. . . . Our Young Friend must be careful about confounding Cherries and Currants! . . Mr. J. T. Lovett says:—"It is an enigma, the answer to which I would give much to know, why the hundreds, thousands, aye millions who have facilities for growing them yet exist from year to year, scarcely tasting any of the delicious and health-imparting small fruits, when an abundance can be had for so small an amount of time and money." . . Mr. E. P. Roe says: "Can a man say that he provides for his family when he furnishes them with no strawberries? Ought not people who say that they cannot afford the time and money required to supply their table with small fruits, and in consequence pay ten times the amount in doctor's bills, be placed in lunatic asylums?" . . Tho sea weeds, called by various local names, collected in vast quantities along our bays and creeks, should be composted with bone flour. Thus fermented the phosphate, according to French authorities, is rendered very soluble. . . It appears that the mosquito was not made in vain. Under their influence the cattle of Texas become docile and easy to manage. The Michigan Farmer suggests that all mosquitoes migrate to Texas where they can be made useful. . .

"Tell me I *hate* the bowl?
Hate is a feeble word.
I *loathe*, ABHOR, my very soul
With deep disgust is stirred,
Whene'er I read, or hear, or tell
Of the dark *beverage* of *hell*."....

For home use there is no better beet than the Early Bassano, while Early Blood turnip is as good as any for market. This is a good winter beet if sown late, . . Plant cabbages. If they bring a good price, sell them; if not, feed them to sheep, milch-cows and pigs. . . Mr. Joseph Harris says: "I sow my cabbage seed with a garden drill in rows fifteen inches apart; and that is all there is to it. As soon as the plants appear, hoe the ground between the rows and keep hoeing." . . "Of course, it is desirable to select good, rich mellow land for the seed-bed. Sow broadcast, two pounds of superphosphate to the square rod, and harrow it in and roll or rake the land smooth and level before drilling in the seed." . . When the the plants are large enough, take them up with a fork. Let all the soil adhere that will. If the ground is dry, pour water into the holes and press the earth *firmly* about the roots and necks of the plants. . . We are told that though farmers are all getting better prices for produce of all kinds, they at the same time expect to buy seeds and machinery at the same or a less price than they paid last year. . . The Jefferson Grape of Mr. Ricketts is spoken highly of by those who have tested it. We have a vine and shall report in due time. . . *Astronomical Contingencies.*—If a body meet a body coming through the sky. . . Extract from a remarkably sharp boy's composition on tobacco: "The habit of using tobacco is very bad; in fact, my Third Reader says it is disgusting. Even hogs won't use tobacco. But that's because they ain't persevering. No one likes tobacco the first time. And if hogs would only stick to it a little while, there wouldn't be no more said about their refusing the filthy stuff." . . Alexander Hyde says in the N. Y. Times, that a farmer without a wife is like half a pair of scissors! . . He further says and the Rural indorses it heartily:—I do say that the position of a farmer's wife is one peculiarly adapted to a life of usefulness, and I would like to ask the frivolous and fashionable girls who scorn the hand of a husbandman, whether a life spent in useful employment such as the average farmer expects of a wife, will not in the retrospect, give more satisfaction than one spent in the gay rounds of fashionable society? . . Some farmers, he further says, and we are *very* sorry to be obliged to indorse this too—treat their wives as if they were beasts of burden, made to rear children and do drudgery. . . But he omitted the further truth that such brutality is at least as common among other classes as among farmers. . . Seeds of Asparagus may be sown as early as the ground can be worked. Sow in rows a foot apart in rich, mellow soil. Keep clear of all weeds. Next spring, prepare a bed of deep rich soil and transplant to rows three feet apart and about two feet apart in the rows. . . . There are hundreds of farmers who have been intending, all of their lives, to have an Asparagus bed, and they still intend to have one. No vegetable is more wholesome or delicious—none more profitable. Sow the seeds this spring and delay no longer. Or purchase the roots which will save one year of time. . . It seems odd to say that Pennsylvania has become one of the largest tobacco-growing States in the Union, and yet such seems to be really the case, as the production for the year 1879 shows. . . . Considerable importance appears to be attached to a discovery of the superior value and quality of flour manufactured from the seed of the common broom-corn. . . Instead of searching for substitutes for wheaten flour, however, the proper course for our people to pursue is to extend the cultivation of wheat in all parts of the country where the crop can be made profitable. . . At this day the average tomato is no earlier than it was fifty years ago. . . We seem to be gaining all the time, but is it not rather because the old kinds deteriorate? The whole experience seems like the ancient tread-mill. We keep stepping up and up, but do not get farther ahead, because the wheel is going back against us.—Germantown Telegraph. . . We see that Beauty of Hebron potato is offered in Hooper & Co's catalogue (London, Eng.) at $3 per bushel. . . There is a new Strawberry called "Cetewayo." *What* a name for a Strawberry!

News of the Week.

AGRICULTURAL NEWS.

Monday, March 1, 1880.

A thorough canvass of California shows that the crop prospects are, almost without exception, excellent. Greater area than heretofore is under cereal cultivation.....An English court has condemned the Grinwood line of steamers to pay $15,000 damages to George Wright, of Waterford, Ontario, Can., for a lot of cattle shipped by him for England in 1878, and which were thrown overboard in mid-ocean by one of their captains who believed a storm imminent. A Belgian court had previously awarded 100,000 francs, but this had been set aside by a higher court.....The Association of Breeders of thoroughbred Holstein cattle will hold its annual meeting for the election of officers, etc., etc., at the Empire House, Syracuse, N. Y. on March 19, 1880.....The fourth volume of the Holstein Herd book was ready for distribution about March 1st.....Australians are confident of doing a large trade in meat with Great Britain, through the Suez Canal, at 2c. per pound. .....A Western Hereford breeder lately obtained an order for 400 bulls from one cattle king. .....An English firm of cattle buyers for this country lately shipped 60 Short-horn bull calves to Kansas—all subject to Herd Book entry..... The famous Short-horn heifer, Icile, illustrated in RURAL of Jan. 11th 1878, has been slaughtered. She dressed 70 per cent. of her live weight..... Famine in the interior of Russia is reported as heart-rending. The provinces of Saratoff and Kief, which annually export, in ordinary times, enormous quantities of grain, had scarcely any crop last year. The calamity is aggravated by the want of fodder for cattle, the peasants being forced to sell them. In the Caucasus the famine is still greater, where people are committing suicide and selling their children.....According to the Mark Lane Express of Feb. 24th, imports of wheat into Great Britain during the previous week were small; sales ditto, mainly retail, large dealers holding off for a big drop here. Prices steady except for Russian wheat, which fell a little early in the week, but recovered later. Maize scarce and prices stiffer. Barley and oats quiet with a slight advance on the latter..... Prof. Arnold says a good cow should give 8,000 pounds of milk yearly; the average here is a trifle more than half that; in Holland 13,000 is said to be a common yield.....The toll on foreign salts on the Erie canal is 2½ mills per 1000 lbs. per mile, that on domestic salt ½ mill.....Philadelphia is arresting numbers of oleomargarine swindlers—that's the right name for those who sell the stuff as butter for butter prices.....The Pennsylvania Agricultural Society is already busy arranging for a grand State Fair and Sheep Show next Sept. The success of the last exhibition was so great that the Society has decided to offer premiums amounting altogether to $40,000. Of this amount prizes of $6,000 have been set aside for sheep, $7,000 for horses, $3,500 for cattle, $3,000 for swine, $1,000 for poultry, $1,500 for dairy products and the balance allotted to machinery, fruits, seed and other products.....According to advices of Jan 27 to 29, about Welling, New Zealand, floods had just caused great damage to crops.....New South Wales, Australia, had imposed a duty of ten shillings on sparkling and five shillings on other wines—an injury to Californian vineyardists.....A cyclone and huge tidal wave has greatly injured farming and other property in that province.....The harvest in the province of Victoria was well advanced and the yield heavy. It was expected that 12,000,000 bushels of wheat would be available for export from that province alone.....The Italian Government offers cash prizes for vineyards raised from grafts of American varieties that will resist the attacks of phylloxera. The wonderful hardiness of native American vines, and the high repute of Chateau Yquem wine, which is made from an American grape domesticated in France, show that the experimenters have a double reason for hope..... The Farmers' Club of this city has applied to the Police Commissioners for permission to take away all the street sweepings to be used for manurial purposes. Hitherto they have been dumped from scows out at sea or in the bay at considerable expense. Permission given.....Dennis McCarthy, of Newburg, N. Y., rejoices in the possession of a prolific cow that last Tuesday gave birth to four calves—three heifers and a bull. A few hours later, when last heard from, all of the calves were strong enough to stand firmly on their legs and suck. They resemble each other in color and size. They are symmetrically formed, and appear to be in a healthy condition..... Mr. McCombie, of Tillyfour, Scotland, late Member of Parliament for the Western division of Aberdeenshire and famous as a farmer and a breeder of black polled cattle and as the winner of the first premium at the Paris exhibition of 1880, for the best group of cattle, died at his residence Tillyfour, Aberdeenshire, Feb. 1, in his 75th year... The Germans, who for the last decade have devoted great attention to horse and cattle breeding, propose to hold an international agricultural show, especially of live stock, at Hamburg in 1882. The last one at the same place in 1863 was very successful ...The past year was the first since 1853 on which the sugar cane tasseled in La., a size indicative of a splendid yield....It is proposed in Germany to totally prohibit the importation of horses, oxen, sheep and swine from Russia and Austria, because in addition to cattle-plague other diseases, such as glanders, sheep-pox, foot-and-mouth disease, etc, are constantly introduced from those countries.... Large quantities of ancient wheat and pea seeds have been discovered at a considerable depth under the walls of Homeric Troy, especially near the Skaian gate....From Lceswitz, Austria, we are told that a cow there, last year brought forth five perfectly developed living calves, all of which have since done well. Two of these, both bull calves, were dropped at the beginning of the year, and the other three, one bull and two cow calves, in the month of December....The following is the total return of outbreaks of contagious diseases among stock in Ireland for the week ending Jan. 24th:—Pleuro-pneumonia, 26; sheep scab, 26; glanders, 2; farcy, 1; anthracoid diseases, 13; foot-and-mouth disease, *nil*. The same was the case in England....The organization of the Orange, Sullivan and Sussex County Milk Producers' Protective Association was completed Wednesday at Middletown, with M. D. Houston, President ... Abundant rains have delighted rural Texas ... Georgia got $40,000 last year for guano inspector fees....$25,000 worth of goat-skins were shipped from Corpus Christi, Texas, last year....Southern tramps are meandering North after the cotton-picking season....South Carolina flatters itself that a recent snow storm has killed the Hessian fly, which had begun to damage the wheat crop. ....Georgia will hold no State Fair this year, but will give all her attention at that season to politics....Scab among sheep is very disastrous in Atacosa Co., Texas; sheep raisers are organizing to eradicate it....Lagrange, Texas, is to have a sorghum sugar cane factory with a capacity of 60 tons of cane per day; and Early Amber cane is to be largely planted in the surrounding country.... Efforts are being made to establish a cheese Board of Trade at Ogdensburg, N. Y. Twenty factories have engaged to sell their cheese there—cheaper freights to Liverpool and other causes..... Seven head of cattle belonging to S. T. Mead, of Greenwich, Conn., have been officially declared afflicted with pleuro-pneumonia, and their slaughter advised by Prof. Law. The Governor's action not known yet....Sec. Sherman reports to Congress that the cattle exports for the past six years have aggregated nearly $23,000,000; that pleuro-pneumonia is contagious among cattle; that it is always introduced here by contagion; that the only means of suppression is by the destruction of infected cattle; that none exists or has existed in any State west of the Alleghanies, and there is none now in the United States on or near the boundary of Canada or in Canada. The disease exists in the eastern part of New York, in New Jersey, Pennsylvania, and possibly in parts of Maryland, Virginia, and the District of Columbia....A circular has been issued by the Treasury Department revoking the order of November 3, 1879, which prohibited the importation of neat cattle from the Dominion of Canada The revocation was to take effect March 1....This week's circular of the Liverpool Cotton Brokers' Association, published on Feb. 27, says: "Cotton was in comparatively limited demand throughout the week, and quotations show a slight decline. American was in moderate demand which was fully supplied, but quotations are reduced 1-16d. In Sea Island business was small, but prices were firmly maintained. Futures opened dull and the tone was generally quiet. Prices, after slight fluctuations, show a decline of 1-32d.@1-16d." ... A leading Liverpool grain circular of February 27, says: "The wheat trade, though less buoyant, has been generally steady. At the provincial markets during the past few days wheat was held for 1s @ 2s. per quarter advance, which somewhat checked business. Cargoes off coast were firmly held, but the demand was less active. There are larger offerings for future arrival, causing prices to tend in favor of buyers. Corn was very scarce, but without quotable change. Country millers are indisposed to follow up recent purchases. Sellers are willing to accept a reduction of 2d. from Tuesday's rates, but there was no general pressure to sell. There is more corn offering, which meets with slow inquiry at a ½d. decline.....The railroad rates on hogs from Chicago were reduced, on Feb. 26, five cents per cwt., and rates to all New England ports were made the same as those to this city.....It is said that reductions in grain rates are not improbable,—navigation will soon be open, and force these.....The regular monthly meeting of the New York Horticultural Society will be held at 55 West 33d Street, near Broadway, on Tuesday, March 9th, at 2 P.M. Lots of premiums offered for flowers, etc. This Society usually meets on the first Tuesday in every month at 2 P.M. at above place.

"Now You See It."

Gilt-Edge Butter Maker takes the "witches out of the churn" and turns tedious, unsatisfactory churning into gratifying success. Sold everywhere.

HAMBURG, N. Y., May 28th, 1879.

JOHN E. PIERCE, Sec'y World's Dispensary Medical Association, Buffalo, N. Y.:

Dear Sir—Yours asking as to reputation of "Gilt-Edge Butter Maker" received. We have never kept it until lately. Have sold one case (3 doz. boxes) and it has given the best of satisfaction.

Yours respectfully, T. L. BUNTING.

FOR COUGHS, Asthma and Throat Disorders, use "*Brown's Bronchial Troches*," having proved their efficiency by a test of many years. Imitations are offered for sale, many of which are injurious. The genuine "*Brown's Bronchial Troches*" are sold *only in boxes*.

Burnett's Cocoaine is the best and cheapest Hair Dressing in the world. It kills dandruff, allays irritation, and promotes a vigorous growth of the Hair.

The Markets.

Boston.—FLOUR.—The sales of Western superfine at $5@5.25; common extras, $5.25@6.25; medium fancy bakers' and spring wheats at $6.25@6.75; winter wheats, $7@7.75 for St Louis; $6.62@6.75 for Michigan, $6.75@7.25 for Indiana; winter wheat patents at $7.25@8.50; fancy spring wheats at $7.25@9. CORN 61½c. for high mixed. OATS, 52@54c. for choice and extra white; 51c. for No. 1 white; 49c. for No. 2 white; 48 for No. 3 white; 47c. for No. 2 mixed; SHORTS firm at $22.50; no fine feed offering and middlings nominally $24. HAY.—First quality coarse Eastern and Northern at $15@16 ₱ ton; poor and medium at $11@14. RYE straw $20@22. PRODUCE—The following prices are paid by receivers: BUTTER—New York and Vermont choice creameries at 28@30c ₱ lb, fair to good, 25@27; fall dairy made, choice; 25@28c.; winter dairy made at 20@24c.; straight dairies, choice at 22@25c.; dairies common to good, at 18@20c; Eastern and P. E. Island, 18@20c.; Western choice creameries 35@37c.; choice dairy packed at 23@26c., choice ladle-packed 23@25c, fair to good do. 20@22c.; common 17@19c. CHEESE—Choice Northern factory 14½@15c ₱ lb fair to good at 12½14c. and common 9@11c; Western factory, choice 13@14c; fair to good 11@13c.; common 8@10c. EGGS—Eastern at 15@16c.; Northern 15c.; Western 14@15c. ₱ doz. BEANS—Northern hand-picked pea at $1.80@1.90 ₱ bushel; do. do. Western at $1.75@1.85; do. common $1.65@1.75; medium choice $1.55@1.60; common to good $1.35@1.40; Yellow Eyes $2.10@2.15; Red Kidneys at $1.75@1.85; Canada peas 80c.@$1 ₱ bushel for common to choice; Green peas $1.80@1.85. POTATOES—we quote Houlton and Maine Central Rose 50@55c. ₱ bushel; Houlton Jackson Whites at 40@45c.; Vermont Rose at 50@53c.; do. Jackson at 40. Peerless at 45@48c. and Prolifics at 53@55c. ₱ bushel. ONIONS, $3 75@1 ₱ bbl. APPLES at $1.75@3 ₱ bbl according to quality. CRANBERRIS at $6.50@9.50 ₱ bbl. SEEDS.—In Calcutta Linseed nothing doing and prices steady. We quote clover seed as quiet at 8½@9½c. ₱ lb for Western and New York; timothy at $2 90@3 ₱ bushel; red top at $2 70@3 80 ₱ bag; Canary seed at $2 45@2 85, and American Linseed $1 50@1 85 ₱ bushel.

Chicago.—WHEAT—No. 2 Chicago spring at $1.23½. CORN—fresh at 37½@37½c., cash; rejected, at 35½c. OATS—fresh at 32¾@33c. BARLEY steady at 78c. PORK, $11.70@11.75, cash. LARD weak at 7.12½c., cash. BULK MEATS—Shoulders, 4 20c.; short ribs, 6.55c.; short clear, 6.70c. BUTTER—Creamery quotable at 30@32c. for good to choice, and 33@34c. for fancy brands. Most of the dairy butter is selling at 20@25c. for fair to choice, although some very fancy makes almost equal to creamery sell rapidly within 3@5c. of the creamery. The lower grades of packed butter range at 13@18c. ₱ lb. Roll salable at 17@18c. for medium to good packers, and occasionally at 18½@19c., but local dealers pay higher prices and therefore obtain the bulk of the receipts. CHEESE—Full cream, 14½@15c; part skim, 12½@13c; low grades, 8@10c. GREEN FRUIT—Apples, ₱ bbl., in lots, $3@3.75; cranberries, ₱ bbl., $8@9; lemons, ₱ box, $6@7; Valencia oranges, ₱ case, $8@9; Messina oranges, ₱ box, $3.25@4.25; Malaga grapes, $7@9. HAY in small demand and easy. No. 1 timothy, ₱ ton, $15@13 50; No. 2 timothy, ₱ ton, $12@12.50; mixed, $10@10 50; upland prairie, $10@10.50; No. 1 prairie, $8.50@9; slough, $8.00. SEEDS—Timothy in good demand; sales made at $2.40@2.65, prime closing at $2.60@2.65. There is some talk about seed that has been mixed with stuff the late fire being on the market. It is understood that but little of the fire seed is dry enough to handle now. Clover also has advanced, being in demand and scarce. Sales are noted at $4.30@4 40, and of mammoth at $4.60. Flax, $1.65@1.66; millet at 70c. WOOL—There is a good, steady demand for all grades, and prices remain firm and unchanged. The trading is mostly on order account, Western manufacturers being the principal buyers. The asking rates from store for eastern Iowa, Wisconsin and Illinois wools range as follows, Tub-washed bright, 52@57c. ₱ lb; do. dingy and coarse, 50@55c.; do. coarse, 45@47c.; unwashed medium, 37@40c., do. coarse, 33@35c.; do. fine bright, 28@31c.; do. heavy, 24@28c.; buck's fleece, 20@22c. Consignments from Western Iowa, Nebraska and Kansas sell at about 2c. ₱ lb less than this range, and burry and poor-conditioned lots at 5@5c. less. HOGS—Mixed packing at $4.20@4.35; choice heavy at $4.45@4.65; light bacon in fair demand at $4.20@4.40. CATTLE—Shipping in good demand at full prices at $3.80@5.20; butchers' steady; cows at $2@3.50; bulls at $2@3.60; steers at $3.60@4.20; oxen at $3.80@4.30; stockers and feeders in fair demand at $2.60@4. SHEEP—Best grades in good demand at $4.75@6; one lot Wisconsin at $6.75.

Cincinnati.—WHEAT at $1 30; CORN at 41c.; OATS dull at 36c. RYE steady at 85c. BARLEY dull; extra No. 3 fall at 75c. PORK weak at $12. LARD dull at $7.15c. bid, $7.20c. asked. BULK MEATS quiet but firm; shoulders at 4c.; clear rib at 7½c.; clear sides at 7¾c. Hogs steady; common at $3 25@$4 20; light at $4 25@4 50; packing at $4 30@4 65; butchers' at $4 65@4 75. BUTTER—Fancy creamery 38@40c., and fancy Western Reserve, 29@30c. Prime to choice dairy 25@28c., fair at 23@24c., and common butter, 19@20c. Packers are not buying, as stocks are so light. CHEESE—Choice factory, 14@14½c.; HAY—receipts excessive: prairie $11@$13; fair to prime mixed, $14@15; fair to prime timothy, $15 50@16 50; choice light pressed timothy, $17 per ton on arrival, and $1@2 more from store. SEEDS—Clover seed firm for jobbing lots at 7¾@8c. per lb. Timothy seed quiet: offered at $2 85@3 per bush. as to quality. Flaxseed is in good demand on arrival at $1 25@1 35 per bushel. HORSES AND MULES in good demand at fair prices: Southern chunks, $40@70; streeters, $85@100; draft $125@160; drivers and saddle horses, $125@175. Good mules are in fair demand, large ones especially. The general run of the market was as follows: Drivers, 100@$175; draft horses, $100@$175; streeters, $75@100; Southern chunks, $50@$80. Mules aged four to eight years, 15½ to 16 hands, $100@140; 15 to 15½, hands, $85@110; 14 to 15 hands, $55@90.

Detroit.—FLOUR steady, with a very limited demand; sales 600 barrels white at $6 25. WHEAT extra white Michigan, $1 29½; No. 1 white Michigan at $1 29½ bid. CORN firm, with a good demand; No. 1 yellow at 44c; high mixed at 43c; No. 1 mixed at 42½c; No. 2 mixed at 42c. OATS more disposition to sell; No. 1 white at 37½c; No. 2 do. at 35c; No. 1 mixed at 36c½; No. 2 do. at 35½c. CLOVER seed has advanced about 15c since yesterday and is very active; No. 2 do. $4 15; prime at $4 40@$4 55. DRESSED HOGS firm at $5.

Louisville.—WHEAT firm at $1.20. CORN firm; No. 2 white at 45@46c. do mixed, at 43@44c. OATS quiet, but steady; No. 2 white at 40@41c; do mixed at 38@39c. RYE steady; No. 1 at 86@87c. PORK quiet at $12 50. LARD steady; prime steam at 7½c. BULK MEATS quiet; shoulders, 4½c; clear ribs at 6¾c; clear sides, 7c. BACON steady; shoulders, 4½@5c; clear ribs, 7½c. MILL OFFAL per ton in bulk; bran, $12 50@13 50; shipstuff, $15; middling $18 50. HAY. Prices are firmly maintained; prime to choice timothy, $18@18 50, and mixed at $12@16 per ton on arrival. FIELD SEEDS delivered from store; timothy, $2 90; orchard grass, $1 70; red top 70c; clover, common red at $4 50, and sapling at $5; bluegrass, clean, 55c; extra clean, 65c. FLAXSEED $1 10 per bushel on arrival. STRAW $8@9 on arrival and $10 from store. BUTTER.—Supplies of all kinds light, and prices have advanced: common to fair country at 14@16c. fair to prime at 18@20c, and choice to fancy at 22@24c; Western Reserve at 23@25c; and Western creamery at 30@38c. CHEESE. Western factory at 14½@15c; off grades, 12@13c; pineapple, 20c.

Milwaukee.—WHEAT dull No. 1 Milwaukee hard at $1 24½; do. soft, $1 22½; No. 2 Milwaukee, $1 21½. CORN; No. 2 at 38½c. OATS No. 2 at 32½c. RYE. No. 1 at 74c. BARLEY No. 2 spring fresh at 65½c. MESS PORK dull at $11 75. LIVE HOGS $4 15@4 35. DRESSED HOGS $4.85.

New Orleans.—CORN active and firm at 58@59c. OATS quiet at 45c. CORN-MEAL in good demand at at $2 60. HAY dull; ordinary at $23@24; prime at $25; choice at $27. PORK scarce and firm; old, $12 75; new at $13. LARD dull; tierce at 7¾@7¾c.; keg at 8@8¼c. BULK MEATS in fair demand and firm; shoulders, loose at 4.40c.; packed, 4.50c; clear ribs, 6¾@6¾c; clear sides at 6¾@7c. PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 28, 1880.

BEANS AND PEAS.—Medium beans are in fair demand and prime are a little firmer. There has been a large movement in marrows at former figures. European buyers have been in market latterly, and it is thought that next week's export statement will show a large total. Exports for the week, 1,650 pkgs. Fancy beans, including pea, white and red kidneys are steady and firm, extra of the latter looking up. Green peas firm at $1.80. A shade lower than last week for Wisconsin. Southern H. K. $2.25 ₱ 2 bush. bag; marrow beans, prime, $1.70; fair to good,

$1.50@1.60; medium, prime, $1.45@1.50; medium, fair to good, $1.35@1.40; pea, choice, 1.65@$1.70; fair to good, $1.45@1.55; white kidney, choice $1.75@1.80; fair to good, $1.60@1.70; red kidney, prime, $1.70; fair to good, $1.55@1.60; turtle soup, good to prime; $1.75@1.80.

Receipts of beans, 5,760; exports, 1,000 pckgs.

BUTTER.—All high grades of butter have held firm with some further advance, and there is no surplus of those grades to prevent a strong future market. Good under grades have also improved; some holders want to make all fair and medium parcels partake of the strong feeling that exists in nice table grades. The new prices for Western belong to only a small part of the arrivals. Prices are above exporters' limits; they have taken only 2,200 pkgs. during the week. Creamery, fresh involces, 38@39c.; good to prime, 36@37c.; fair to good, 32@36c.; poor to fair 28@31c.; fall 24@26c.; early 30@35; State, pails and tub fall choice 30@32c.; good to prime 27@29c.; fair to good 25@27c.; poor to fair 20@25c.; pails and tubs, single dairy, fresh choice 32@34c.; fresh, good to prime 28@30c.; fresh, fair to good 25@25c.; dairies choice 27@29c.; good to prime 25@25c.; fair to good 23@25c.; poor to fair 21@23c., bodies of dairies 19@27c; very poor 16@18c.; Western imitation creamery 22@29c.; dairy, fresh, extra 25@28c.; good to prime 23@25c.; fair to good 21@23c.; poor to fair 19@20c.; special marks, extra 27@28.; prime 23@25c.; fair to good 20@22c.; poor to fair 18@20c.; very poor 16@17c.; roll butter prime 19@24c.

CHEESE.—The market has been very dull this week, and concessions have been necessary to effect sales, closing weak at generally luside prices; quotations are for State factory: Strictly fancy at 14¼@14¾c.; choice at 14¼c.; good to prime, at 13½@14c; fair to good, at 13¾c. State farm dairy: Good to prime at 13@14¼c.; fair to good at 13@13¾c. Wisconsin factory: Fine, 14¼c.; good to prime 13@13c. Ohio factory: Cheddar, fine, 14@14¼c.; do., fair to good, 12½@13¾c.; flat, fine, 14¾; flat, good to prime, 13¾@14c.; flat, fair to good, 12¾@13¾c.

Receipts for week, 5,337 pkgs; exports, 4,300 boxes.

Liverpool cable, 73s.

Freights 30@33s, which is higher.

COTTON.—Trade has been active and prices closed at for February, 12.91c.; March, 12.91c.; April, 13.14@13.15c.; May, 13.37c.; June, 13.58c.; July, 13.68@13.69c.; August, 13.76@13.77c.; September, 13.29@13.31c.; October, 12.42@12.45c.; November, 12.13@12.16.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—Apples are in good demand and strong in price. Peaches are steadily held and in moderate demand; small fruits are generally firm. Quotations are for N. C. apples, fair to good, 7⅛@8¼c.; choice, 9@9½c.; fancy at 10@10½c.; Virginia, at 7@8c.; New York State quarters, at 7@8c.; sliced at 7½@8¼c.; patent evaporated, in cases, at 13½@14c.; prime at 12½@13c. Evaporated peeled peaches, at good to choice, at 22@23c.; unpeeled at 12@14c.; North Carolina peeled, fancy, at 20c.; choice old at 17@18c.; Georgia prime at 16@17c.; fair to good at 14@15c.; common at 10@12c.; unpeeled halves at 7½@8c.; do. quarters at 7@7½c. Pitted cherries at 18@19c. Blackberries at 11@11¼c. Raspberries at 26@27c. Plums at 17@18c.

Exports since Jan. 1st, 3,030 bbls. apples—about half the quantity taken by this time last year.

EGGS.—Receipts for the week, 11,163 bbls.; do. last week 14,542 do. The market has declined with moderated receipts and suitable rates for Lent will probably be quoted early, notwithstanding the fast began so soon this year. Southern eggs are slow of sale, being unevenly packed and too small in many cases to be attractive. Limed plenty and dull.

Near Points, ₱ doz., 15c.; State and Penn. 13¾@14c. Western, fresh, 13¾@14c.; Southern, 13@13½c.; Western and Canada, inferior, 11@12c.; limed, State, 10@12c.; Canada, 11@11¾c.; Western, 10@11c.

FLOUR.—Has been more freely offered and prices easier. Latest figures are $5.00@5.50 for poor to fancy superfine state; $5.40@5.65 for inferior to good extra do., odd lots and lines; $5.65@5.90 for good to very choice do.; $5.00@5.50 for inferior to fancy superfine' Indiana, Iowa, Michigan, &c.; $5.40@5.65 for inferior to good shipping extra do., and $5.65@5.85 for good to very choice shipping extra do.; inferior to about choice white wheat extras $5.90@6.75; about choice to very fancy do. $6.75@8 the latter an extreme; red and amber winter wheat, inferior to very fancy trade and family, at $5.90@7.75; round hoop Ohio, $5.00@6; and trade and family brands of do. at $6.10@7.75; the latter rate for very choice; St. Louis at $6@6.75 for inferior to very good extra; $6.75@7.75 for very good to very choice; Minnesota clear, very inferior to fancy, at $5.65@6.75; Minnesota "straight," inferior to very fancy, at $6@7.75 and patent inferior to fancy at $6.75@8.75; unsound stock at from $3.25@5.75; city mills extra at $6.25@6.75 for ordinary to fancy for West Indies do. for England, $5.40@5.75 for poor to choice; do. trade and family extras, $6.75@7.75; do. for South America, $6.50@7.10; No. 2 at $5.65@4.85 for poor to very fancy.

FRESH FRUITS.—Exports of apples for 2,321 bbls. There is a weak feeling in apples and only choice retailing stock is quoted at the extreme. Prior to choice Baldwins 2@$3.25 Greenings 2@$3.50; Russets, 2.50@$3. A little red fruit quoted 3.75@$4. Strawberries are in steady supply, Florida sending the best. Fla. choice, 50@65c. qt. Cranberries scarce and a western demand supports late prices. Cape, $8@$10; other Eastern, 7@9c.; N. J. crates, $2.75@3. Fla. oranges in good demand when quality is attractive. It is almost useless to send the Rusty coat variety as buyers want bright fruit in more fancy half box cases, 4@$4.25; fair to prime, $2@$3.50. Peanuts quiet; Roasters being fairly supplied. Va., hand-picked, 5¾@6c.; ex. prime to fancy, 5@5¼c.; good to prime, 4¾@4¾c. Shelled 5¾@6¼c. Pecans 8¾c; easier; Shellbarks, 75@90c.; few wanted.

GRAIN.—Wheat has shown a good degree of activity, with full purchases by exporters, but at the close prices are weak and decidedly off from the best rates of the week. Latest sales are of No. 1 white in store and afloat at $1.46@1.47¼; do., February at $1.47; do., March, at $1.47@1.47¾; do., April, at $1.47@1.48; do., May, at $1.49½; No. 2 white at $1.45, ungraded white at $1.13 in store; No. 2 red $1.49¾@1.50½; do., February, at $1.50; do., March, at $1.50@1.51½; do. April option, at $1.50@1.50¾; do., May, at $1.48¾@1.49c ungraded red at 1.45@$1.48¾; No. 2 amber at $1.48; No. 3 spring at $1.39; ungraded spring at $1.25@1.27½. Rye is strong and in good demand. Canada quoted at 98c. in bond, and prime State at 98c. Corn has been freely offered and closed weak in price; latest sales are of New York No. 2 at 53@53¾c.; do., February, at 53½@53c.; do., March, at 53½c.; do., April, at 55c.; do., May, at 53¾c.; New York steamer mixed at 57¾@57¾c.; do., February, at 57¼c.; do., April, at 61c.; ungraded mixed western at 57@59c.; New York No. 3 at 56¾@56¾c.; steamer white at 60c.; yellow Southern at 52@55c.; Jersey yellow at 58c.; white Western at 61c. Oats are freely offered and prices weak; latest sales are of No. 1 white at 50¾c.; No. 2 white at 47½@48c.; No. 3 white at 46¾@47c.; New York No. 1 at 48c.; New York No. 2 at 47¾@47¾c.; do., February, at 47¾c.; do., March, at 47c.; do., April, at 47c.; New York No. 3 at 46¾@47c.; ungraded white western at 48@50c.; ungraded mixed western at 47@48c.; white State at 48@52¾c.; mixed State at 47¾@48c.; No. 2 Chicago 48c.

MAPLE SUGAR lower; first large installments usually move slowly as buyers four to get supplied with reboiled stock. New Ohio 13@14c.

HAY AND STRAW.—There is a liberal demand and prices strong. Shipping hay quoted at 75c.; retail lots at 80@85c.; for medium and 90@95c. for prime; clover at 65@70c. Straw at $1@1.10 for long rye; 65@70c. for short rye, and 55@60c. for oat.

Exports for the week, 813 bales. Since March 1 1880, 15,300 do., or 8,800 more than for 1879.

HOPS.—There is absence of material life to the market and prices are at ill unsettled and in a good degree nominal. Quotations are for

	Cents per lb.

WHICH IS THE BEST SALT?

Professor Henry E. Alvord, of Massachusetts, in a letter giving results of the recent Massachusetts dairy show, stated that ten out of twelve lots of butter taking premiums were salted with HIGGIN'S EUREKA SALT, and commented thereon as follows: "THIS MAY BE EXPLAINED IN VARIOUS WAYS, BUT THE FACT DESERVES NOTICE."

There are also other facts which deserve notice. The English Government has granted a patent to Thomas Higgin for improvements in salt manufacture, and experts estimate that the Higgin method will work as great a revolution in salt manufacture as the Bessemer process has in that of steel. Higgin's Salt is used in the most noted dairies of Great Britain; including that of the Queen; and its almost absolute purity has also made it a favorite there with the finest trade for household use. In this country its consumption has risen in three years from 6,000 to over 90,000 sacks. Both the first sweepstakes prizes at the late International Dairy Fair (for the best butter and cheese made anywhere) were salted with it, as were also most of the other lots taking first prizes, and all this notwithstanding strenuous opposition, including much misrepresentation from the agents of another brand, which, previous to Mr. Higgin's discovery, had a practical monopoly of the dairy salt market, charging consumers an enormous price for a comparatively inferior article. But the monopoly has been broken by Mr. Higgin, who furnishes a vastly superior article (costing from 30 to 40 per cent. more), at the same or only a slightly higher price.

The situation is described in Whittier's lines:

"Gray-bearded Use, who, deaf and blind,
Groped for his old, accustomed stone,
Leaned on his staff and wept to find
His seat o'erthrown.

These wait their doom, from that great law
Which makes the past time serve to-day,
And fresher life the world shall draw
From their decay."

The difference in cost in using the best or the poorest salt is only about *one-thirtieth* of a cent per pound on butter and *one-sixtieth* of a cent per pound for cheese. Patrons of Butter or Cheese factories should stipulate for the use of Higgin's Eureka English salt, and owners of factories making for their own account can afford to pay five times its cost rather than not use it. It imparts a clean, fresh, rosy flavor, and its purity is such that if the goods are solid and well made, like most of the English goods, the keeping properties are quite remarkable.

IT IS THE COMING SALT!

Ask your salt dealer for it, and try it for yourself. It will tell its own story, overcome all prejudices, and make you its fast friend, as it has in thousands of cases within three years among the most progressive dairymen of the United States and Europe.

YOU CAN'T AFFORD TO NOT TRY IT, and your own good judgment will tell you whether to continue using it or not.

For sale by nearly all dealers in Salt.

SUGAR CANE SEED!
For different latitudes. Choice varieties: Early Amber and Honduras, 50 lbs. or more, 15c.; less than 50 lbs., 20c.; 2½ lbs. by mail, $1.00. Special rates on large lots. Also, my book (by mail) on Sugar Making, $1.00. CANE MILLS and SUGAR MAKERS' SUPPLIES.

STOCKBRIDGE
MANURES
For 1880.

Some years ago the Stockbridge Manures were only known to a few farmers in the Connecticut Valley. Now they are so extensively used in different parts of the country as to require two large factories, one in New York and one in Boston to manufacture them. This increase shows what farmers think of good fertilizers, and is not only due to the fact that they are reliable, well-made, and high-grade manures, but also to the fact that farmers have

FOUND THEM PROFITABLE TO USE.

Now that corn, and other farm produce is bringing such good prices, we anticipate that farmers will invest still more largely in our fertilizers.

Besides the Stockbridge Manures, we manufacture several high-grade Phosphates, and deal in first class chemicals of all kinds. Farmers who intend to use Fertilizers of any kind, should

REMINISCENCES OF A LITTLE GIRL.

MRS. M. J. GALPIN.

CHAPTER III.

We will now leave the fugitive pair and return to L —, and see how matters progressed after their flight was known. The rage of McGregor, after he found his daughter had flown, in express contradiction to his orders, was boundless; in fact, it left him powerless to do mischief, to any but himself, and resorting to the whisky in first-class style, he was soon oblivious of all his surroundings. His broken-hearted little wife wept silent, bitter tears over what she considered her daughter's disgrace, and her misery was full to overflowing when she heard the abandoned little one's wailing for "mamma." I never approved of the action of this headstrong pair (when I had learned the facts) in thus flying in the face of all obstacles to obtain their own ends. Aunt Katie (for she was my aunt) was far more to blame than Uncle Tommy, because he was as yet, but a boy in years, and she had been married and had the holy ties of motherhood to bind her, but when we once give way to a blind and ungovernable passion, it is very hard to tell where it will end. Tommy's family were in the deepest sorrow and felt themselves forever disgraced by their son's action; but alas! poor uncle, he suffered for it all the remaining years of his life. When at last Roy McGregor came to his senses, he gave strict orders that his child's name should never be mentioned in his house, nor did her little helpless ones dare to utter the name of mother. When under the influence of liquor he used to take his bayonet and charge around looking for those worse than orphans "to put them out of their misery," as he said, and not have a "turn-coat priest" for a father, but the little waifs soon learned to know his ways and used to make themselves "scarce" in a hay stack till his fury was over. The anger of the church against its "recreant son" was intense, while the rabble were ready to burn the "vile heretics" should they dare to appear. The church proceeded to pronounce its "anathema" against Father Tom and all that might pertain to him.

While the fugitive pair were still wandering as if the "mark of Cain" were on their brows, that fell disease, small-pox, so fatal among the Irish, appeared in the town in its most malignant form. The family of Father Tom (as we shall still call him) were among its victims, also the children of his wife were stricken down. The little, hot, weary heads and restless hands were never still, and at last it was apparant that only death would relieve their sufferings. The bravado and fight of the redoubtable Roy cowed before this unseen foe, and he became as tractable as a child. The gentle grandmother did all in her power for the helpless sufferers, but her heart was torn with grief for her absent, wandering child, who knew not at that moment that the lives of her little ones were fast ebbing away; that never again would she behold two of those forms so dear to her heart. The incessant cry of the dying children was, "Won't mamma tum at all." After the ninth day the eldest of the three rallied and showed signs of improvement, but Annie and Charlie departed to climb the "Golden Stair." Their last words were to tell their mamma that they were "doin' to Heben when she'd tum." Charlie said that he would "tiss mamma good night." Blessed little ones! theirs was the gain, for sad and dreary were the days of the little orphan who was spared from the hands of the fell destroyer. Two of Father Tom's family died, a brother and sister, and those that were spared were almost ruined by the traces of the disease, as they had it such a loathsome, violent form that they had to be turned and handled in sheets. Nearly every house mourned the loss of one or more loved ones, and general gloom pervaded the town. Masses were said in the churches and prayers offered, but they seemed of no avail—the scourge ran its course till it stopped for lack of victims. Now the most ignorant of the masses thought that the sacrilege perpetrated by Father Tom in marrying and in giving up his faith and "holy orders" was the reason that God had sent the pestilence among them, and if the guilty ones could have been found by the rabble they would have been harshly dealt with.

It may seem strange to the children how Father Tom and his wife could remain ignorant of all that was occurring, but you must remember that they were hiding from the vengeance of their people and their church, and only frequented small villages in an obscure retreat, where news arrived months after it had occurred. Ireland is not as large as some of our states, yet in those days one could travel miles without meeting a human habitation. Rail-road communication only extended to important places or cities, so that suburban villages, at that time, were about as isolated as the Black Hills were to us a few years ago. Did you ever hear of a pestilence or famine that was not attributed to God's wrath? Now I don't think so, because all those events have a purely natural cause. Some of the most terrible afflictions we attribute to the "hand of God," whereas, if we but traced them to their source they are easily explained. Known unto God from the beginning were all things and when He formed man to inhabit this earth, which He had made for him, He well knew how the transgression against the laws of Nature or the Universe would affect him. So that we may know when trouble overtakes us; or a nation is plunged into war or famine, that it is but the just result of the transgression of natural laws. Sometimes those very disasters are the stepping-stone, or entrance to good. Look to-day how Ireland is writhing under the heel of England's iron rule; out of all this contention good is bound to come, though now we may not see it. Whenever Ireland allowed free schools, religious toleration and freedom of thought and action, then will the "Green Isle" blossom as the Rose and be as Tom Moore described it, "First gem of the sea." The Irish are a bright, witty, fun-loving race. They can be led with a silken string, but cannot be driven with a lash. I heard an uneducated Irishman say once, that "Faix, they wor like their own pigs, mighty aisy to coax, but very hard to drive." I hope I shall live to see the day that Ireland is blessed with freedom and independence, or that England will sometime come to her senses and see that according to the Irish nature, her policy of coercion, that she has always and is still practicing, is totally wrong. And if she wishes to retain Ireland in her clutches, she will either have to change her tactics, or be forever on the ragged edge of annoyance. In my next we will follow the fugitive pair and see how they are prospering in their perambulations around the country.

Waterville, Kan.

THAT BROTHER OF MINE, OR HORTICULTURE INDOORS—SPICED.

MRS. M. L. SAYERS.

"Will, do help me to move these boxes from the mantel to the sun on the porch," said Bliss, as she looked at her array of pots and boxes in which she had planted seeds, watered and placed over the fire-place to get bottom heat.

"What are you doing with some piled on the others like a 'stack of black cats,' not to be seen in the dark? Do you *raise* flowers by *elevation*?" said Will, as he mounted a stool to reach the highest.

"I stacked the boxes up, in order to have room; besides, the seeds germinate quite as well in the dark and keep moist on the surface, while the air is warm beneath and around them," and Bliss carried out the Geranium-box to a bench on the porch, for she had planted a few cuttings in the fall, then a week ago had stirred up the earth around them with her little floral set of garden tools, and planted fine seeds, sifted over them pulverized earth, watered and left them to germinate while the cuttings would start new leaves.

She was bending over the Geranium picking off the dead leaves and spying out the new tender ones, when Will exclaimed, "Hello, Bliss! Here's a thousand little pale blecphalous chaps peeping out at me, like pigmies at Gulliver."

Bliss found Will on tiptoe peering into the second box, and asked, "Are they up already? Read the label—no, hand them down—Daisies, I declare—up so soon!

"Oh! lack-a-daisy!" said Will, looking into the next box, "Shoo-flyer! Here's your string of wild-geese with their wings spread, and their necks stretched," and Will handed down the next box.

"Tomatoes," said Bliss, as she carried them out. "The sun and air will soon bring the color to them. They will no longer be white geese, as you call them, Will."

"Yes, *colored* Tommy-*toes*, all in rows, like a flock of *crows*," and Will examined the next box, and the next, as Bliss carried out those with Verbena, Pansy, Lychnis, Canna, Candy-tuft, and so on, till she had them all out in the sun; when she sprinkled them gently with luke-warm water. Will continued to comment, sometimes in original rhyme, sometimes in slang, which Bliss reproved as *highly vulgar* and *low*, and not at all suitable for flowers, which breathe purity and should *elevate*.

"Oh! yes, you were trying to make an *elevator* of those boxes for your brother, were you? And did get me up as high as a three-legged stool and my tip-toes would lift me? much obliged," said Will. "But why do you call these little fuzzy plants *fish* Geraniums. Do they bloom *ichythology*? They ought to be aquatics."

"Their right name is "Zonale," possibly because belts of shade, like zones, around their leaves. We call them "fish," because of a fancied resemblance in the smell of them," explained Bliss.

"And do you carry them in and out, and set them up and down, because they *smell* like fish? I'll catch you some to wear at your *throat-latch*, or in your vinaigrette," said Will, as he snatched a minnow from the aquarium and held it to Bliss's nose—poor girl!

"Mother!" called Bliss, and Will dashed the fish into the jar and fled.

Bliss now enjoyed looking over her little garden in the warm sunshine, picking off the green aphis with the point of a darning needle and feeding the fish with them, and the tiny worms from the damp earth in the boxes. When the sun got low, she placed the boxes again upon the mantel for the night. She will have early plants for her beds.

LETTERS FROM THE COUSINS.

Dear Uncle Mark and Cousins:—I suppose that I can hardly claim relationship, as I have been silent so long. I was at Chautauqua last summer. A short time ago a brief sketch was in the Rural about Chautauqua. I wrote several letters, after my return home, about my experience while there; but, finding all too long, would not send them. I received quite a collection of presents on Christmas; one of which was a large autograph album, in which I would like to have you all write. I do not live on a farm and never have, so I know very little about farming, never having raised anything but flowers, with the exception of the radish seeds Uncle Mark sent to me. I must tell you about them: After I had prepared some ground, about a foot square, I planted all of the seeds, and covered them over lightly; I watered frequently, and was soon rewarded by seeing a regular bed of green heads peeping up. When they grew larger, I intended to transplant them; but some one told me that they could not be transplanted. I knew that they should not be so thick, so I pulled some up. Some of them grew to be quite large, but were so crowded that they had very little chance to flourish. I am studying painting, with the intention of making it a profession. One small panel, that I painted, sold for ten dollars. I have some pastil pictures also, but do not know as yet whether they are sold or not. One word to Heliotrophe. I heard Joseph Cook's lectures, while at Chautauqua, and am also reading his latest lectures. You addressed the editor as U. M. in your last letter and signed yourself as "your loving cousin." How is that? Two sisters and also Slayer-of-conceit, why do you not write again? With love to all. Frizzle Top.

Dear Uncle Mark:—It has been a long time since I have written to you. I have been pretty busy getting subscribers for the Rural, and I suppose this will go into the dreaded waste-basket; but I will trust to the best. Well, about horticulture; I have not done much. I have got a few raspberry plants, but did not have very good luck. I tried to get a club for the Rural. I traveled some and got three (3) subscribers but let Mr. Knapp have them. Shall try again another year if nothing happens. Well, if this finds its way into the Rural I will try to summon courage to write again. Hoping to hear from the cousins soon. I remain ever yours, Willie K.

Chenango Forks, N. Y.

[You should not have given up getting subscribers too early, Willie. A very few more would have entitled you to a printing press, a set of telephones, or to that wonderful pocket-knife, or to any one of the multitude of things offered in the Rural Premium List. It would have paid you well for the trouble.—Uncle Mark.]

Dear Uncle Mark:—I would like to join your Horticultural Club. I have never done much gardening, but I am going to have a garden of my own next summer if the wind will hold up long enough for me to get the seeds in the ground. I am going to have water-melons for one thing and peanuts for another. I shall have some flowers, too. I like Pansies. The flowers look like little faces and I like to see them nodding at one another. We moved here last summer, and into a new house built in a corn field. The corn is gone now and it looks bare, so we are all thinking of the trees we will plant in the spring. I am ten years old. I go to the town school; have a mile to go. It is very pleasant here but the wind blows hard sometimes.

Clay Co., Kansas. Raymond N. Story.

Dear Uncle Mark:—Will you please to open the Horticultural door to two little Texans who very much enjoy your letters as well as those from the dear Rural Cousins. We have a long season here and raise two crops a year. Last year we had a cotton patch, and a sweet potato ridge, beside some hills of watermelons, all of which did well. Nobody else did any work on them. This year papa is going to give us some pearl millet seed, such as your paper sent him, and if you too, will favor us with some seeds—we will "see what we shall see," and in due time report to you, our success. From your little nephew and neice,

Harley and Ella Matthews.

Bexar Co., Texas.

Dear Uncle Mark.—Some time ago I promised you that I would report my success as a florist I suppose you will think it is rather late, but as the old saying is, better late than never, I think that I can say that my flower garden was a success. I received the second premium at our county fair for the largest and best variety of cut flowers. I intend to have another flower garden next spring.

ONION SEED.
Catalogue of Farm, Garden and Flower Seeds for 1880, with directions for cultivating, free. Send for it. Address, JOSEPH HARRIS, Moreton Farm, Rochester, N. Y.

READER If you love rare flowers, *choicest only,* address ELLIS BROS., Keene, N. H. It will astonish and please. Free.

PERSONAL ITEMS.

There is a Baron Von Munchausen on Von Moltke's staff.

Emperor Francis Joseph, of Austria, lunches at noon on black bread and beer.

Thomas Dawson, the veteran horse-trainer, and for fifty years connected with the English turf, is dead.

Senator Lamar of Mississippi is rapidly recovering his health, and expects to be at Washington in a few days.

The Countess Panil, lady-in-waiting to the Czarina, was last week banished to Archangel, charged with Nihilism.

All the ladies at Washington agree that Mrs. Hayes makes a better President than Mr. Hayes and that she ought to have a second term.

Parnell says that he expects to remain in America about two months longer. He will visit California. In regard to his mission to this country he says that up to last week $80,000 had been received in Ireland through the agencies of the men who are working with him. The Herald fund, however, already amounts to upwards of $250,000.

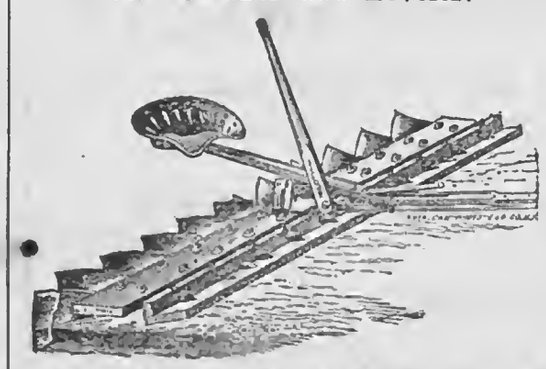
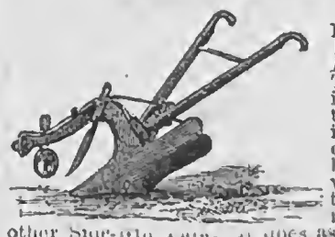
Implements and Machinery.

"ACME"
Pulverizing Harrow,
Clod Crusher and Leveler.



Has twelve **steel** coulter teeth and ten **steel** cutting spurs. Cuts over six feet wide, and two to four inches deep. The only implement combining Pulverizer Crusher and Leveler! performs all three operations at one time in the most perfect manner. Works perfectly on light soil, but is *especially adapted to soil and hard clay where other Harrows fail.* Agents wanted. Send for circular. NASH & BRO.,
Harrisburg, Penn., and 22 College Place, New York.

THE BELCHER & TAYLOR AG'L TOOL CO.



Manufacture this Plow of the *best Cast Wheel Iron*; also of *Patent Hard Metal.* The handles vibrating from one side to the other as the plow is turned at the end of the furrow, enables the plowman to walk squarely behind the plow—a feature not possessed by any other Side-Hill Plow. It does as good work as any Land-Side Plow. For further particulars and prices send for our new *Illustrated Catalogue.* Address

SULKY PLOWS.—THE SUBSCRIBERS are the only manufacturers of

OSBORN'S SULKY PLOW,
the only Plowing Machine that has proved a perfect success in all kinds of soil. Any kind of plow can be attached. The plowman rides and handles the plow with ease, regulating the depth and width of furrow. The draft for the team is materially less, and the ordinary laborious mode of plowing is reduced to one of comfort and ease. Sulky made for both right and left hand plows. Also, manufacturers of
THE MEADOW KING MOWER,
and other Agricultural Implements.
Send for Circulars. GREGG & CO.,

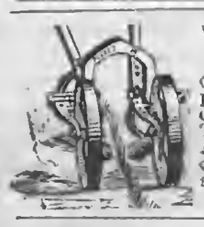
Miscellaneous.

One Hundred Years Old.
1780 1880
WALTER BAKER & CO.,
Dorchester, Mass.,
CHOCOLATE, BROMA AND COCOA
In their best and purest form, contain every ingredient that is needful for the sustenance and growth of the human system, being composed, as determined by chemical analysis, of starch, gum, gluten, oil, and a white crystalizable substance called theobromine, similar to theine in tea, but containing more nitrogen and being an important adjunct to nutrition.
SOLD BY GROCERS EVERYWHERE.
LA BELLE CHOCOLATIERE. Our Book of Choice Chocolate Receipts sent free to any Address.



WE HAVE NEVER BEFORE made such a variety of Garden Seed-Sowers, Wheel Hoes, &c.
WE HAVE NEVER BEFORE offered tools so well made, beautifully finished, and perfect in practice.
WE HAVE NEVER BEFORE combined so well variety of work with ease of operation. These machines quickly save first cost. They are prominent Agriculturalist *premiums*, and JAS. VICK says he has never sold any so popular. Correspondence is solicited, and descriptive catalogues with engravings are sent *free*

S. L. ALLEN & CO., 229 Market St., Philadelphia, Pa. Mfrs. PLANET JR. Goods.

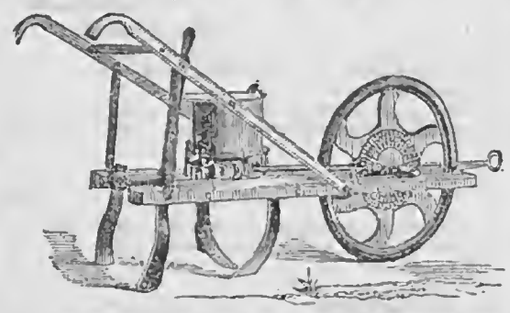
Implements and Machinery.

Sawing off a Log,
Easy and Fast.

Our latest improved sawing machine cuts off a 2-foot log in 2 minutes. A **$100 PRESENT** will be given to two men who can saw as much in the old way, as one man can with this machine. Circulars sent free. W. GILES, 741 W. Lake St., Chicago, Ill.

A. H. Frank, Buffalo, N. Y., owns and controls Eastern and Middle States.
CAUTION.—Any sawing machine having a seat for the operator, or treadles for his feet, is an infringement on our patents, and we are prosecuting all infringers. SO BEWARE WHO YOU BUY OF.

HOOSIER CORN DRILL!
60,000 IN USE.



Drops, with great regularity, one grain in a place, either 12, 16 or 20 inches apart, does the covering uniform in depth, and is both time and labor saving. A given area of corn planted with this machine contains as many plants as when hilled, but their arrangement is such that *each* plant has access to the *same* amount of plant-food that must necessarily be *divided* between from 3 to 5 plants when huddled together in a *hill.* Hence a healthy start and vigorous growth of the plants and the consequent production of large, well matured ears, by which the quality is improved, and the yield increased from 10 to 20 bushels per acre, over hill planting are natural results following the use of our **Corn Drill.** Send for circular.
HOOSIER DRILL CO., Richmond, Ind.

EMPIRE DRILL.

Sows all kinds of Grain evenly and accurately without bunching or breaking the kernels. Sows any brand of Commercial Manure without pasting or clogging.
THIS CUT REPRESENTS OUR NEW FORCE-FEED FERTILIZER DISTRIBUTOR.

THE ONLY DRILL IN THE WORLD
Having a Force Feed-Grain and Fertilizer Distributor.
Quantity of Grain and Fertilizer sown regulated by change of gear.
Send for circulars describing this wonderful invention, to the

KIDNEY-WORT
The Only Remedy
That Acts at the Same Time on
The Liver, The Bowels and The Kidneys
This combined action gives it wonderful power to cure all diseases.
Why Are We Sick?
Because we allow these great organs to become clogged or torpid, and poisonous humors are therefore forced into the blood that should be expelled naturally.
KIDNEY-WORT WILL CURE
Biliousness, Piles, Constipation, Kidney Complaints and Diseases, Weaknesses and Nervous Disorders.
by causing free action of these organs and restoring their power to throw off disease.
Why Suffer Bilious pains and aches?
Why tormented with Piles, Constipation?
Why frightened over disordered Kidneys?
Why endure nervous or sick headaches?
Why have sleepless nights?
Use KIDNEY-WORT *and rejoice in health. It is a dry, vegetable compound and* One package will make six qts of Medicine. *Get it of your Druggist, he will order it for you. Price,* $1.00.

HANSEN'S DANISH LIQUID
BUTTER COLOR.
Prepared in vegetable oil by skilled chemists. Does not color the buttermilk. Imparts natural rich color and *enhances price* of butter greatly. Largest and fancy butter-makers have adopted it. Sample by mail, free.
WHITMAN & BURRELL, Little Falls, N. Y., Wholesale Agents for America.

ASK FOR
Wells, Richardson & Co's
PERFECTED BUTTER COLOR
It Gives Butter the gilt-edged color the year round. The largest Butter Buyers recommend its use. Thousands of Dairymen say IT IS PERFECT. Used by all the best Creameries. Awarded the International Diploma at N. Y. Dairy Fair. Ask your druggist or merchant for it; or write to ask what it is, what it costs, who uses it, where to get it. WELLS, RICHARDSON & CO., Proprietors, Burlington, Vt.
USE ONLY THIS THE FIRST AND THE BEST

A Wise Reform

The habit of administering quinine in powerful doses; as an antidote to malarial maladies, was once dangerously common. Happily this practice has undergone a wide reform. Not only the public, but professional men have adopted, not wholly, of course, but largely, Hostetter's Stomach Bitters as a safe botanic substitute for the pernicious alkaloid, the consequences of this change are most important. Now fever and ague sufferers are cured—formerly their complaints were only for the time relieved, or half cured—the remedy eventually failing to produce any appreciable effect, except the doses were increased. A course of the Bitters, persistently followed, breaks up the worst attacks and prevents their return. The evidence in favor of this sterling specific and household medicine is of no ambiguous character, but positive and satisfactory, and the sources whence it proceeds are very numerous.

COOLEY CREAMER.

Awarded Gold Medal at Paris Agricultural Exhibition, 1879.

Butter made by this process, awarded Sweepstakes at International Dairy Fair, 1878, and Two Gold Medals and First Premium at same fair, 1879. First Premium at Royal Agricultural Exhibition, London, 1879.

It requires no milk-room.
It raises all of cream between milkings.
It affords better ventilation.
It requires less labor.
It is more thoroughly made.
It is cheaper,

and gives better satisfaction than any other way of setting milk.

Send for "Dairymen" giving full particulars and testimonials.

Horticultural.

THE RASPBERRY.

THE SOIL—ITS CULTURE—PROTECTION.

Best of the Reds. Best of the Caps. Foreign Varieties.

NOTES FROM THE RURAL GROUNDS.

WERE it generally known that a supply of this delicious substantial and health-imparting fruit may be had for a month to six weeks with less labor and expense than are necessary to produce a supply of peas for the same length of time, it seems to us there would not be such a dearth of this fruit upon the family board of those living in the country during the sultry days of July and August. Hence the object of these notes is to give a few timely directions regarding the simple culture this fruit requires to yield an abundance.

The Soil and its Preparation.

Many are deterred from planting, thinking they have not the proper soil for Raspberries. While a deep, moist, cool soil is best (except for the Cap varieties, when a sandy loam or even quite light soil is preferable), yet they will quickly adapt themselves to almost any soil or situation. In brief, any land that will grow good corn or potatoes, will also grow Raspberries. They can also be planted between the rows of fruit trees, where but few plants will succeed, and they will be benefited by the shade, providing it is not dense. In preparing the soil, as it is to be cultivated on the surface only for years to come, it is obvious that it should be done thoroughly. In this connection it may be well to state that a failure to comply with this requirement is a very general cause of but partial success, and, in some cases, no success at all. If the planting is to be done in the fall, the work *should* be commenced during the summer; if in the spring, in the autumn, by first applying a dressing of well-rotted manure over the entire surface, (two inches in depth are none too much) or a liberal coat of wood-ashes, ground bone or muck; the last, if used, being first well sweetened by lime or the action of the weather. The ground should then be thoroughly pulverized to a depth of at least fifteen inches, with spade or plow, incorporating the fertilizers used with the soil. If to be done by plow, do so by plowing as deeply as possible, following in the furrow with a subsoil plow in like manner. Level the ground by harrowing and then repeat the operation by going in the opposite direction. This will not only produce a fine mellow surface but a loose subsoil also, into which the roots will extend—thereby securing moisture, especially during the parching weather of mid-summer, at which time the plants need moisture most, in order to perfect the crop. Nearly the same good results may be attained by preparing the soil the spring of planting, if the work is done *early* and thoroughly. The only real advantage of commencing the preparation of the soil so far in advance of planting, is that during the interval the fertilizers used become the more thoroughly incorporated with the soil.

Planting.

From time immemorial it has been a matter of dispute which is the better season for planting—spring or fall; and it is a point that in all probability never will be settled, as neither is better for all soils and circumstances. No one need fail, however, in planting at *either* season. When planting in the autumn a small mound of earth or a shovelful of compost should be placed around each plant (if earth is used, rake it to a level in early spring), while if the planting is to be done in spring it should be done very early—as early as the season will admit. The Raspberry is one of the first plants to commence growth in spring, and many checkmate success at the outset by deferring the planting until the buds at the roots, which are to form the canes for the first crop of fruit, develop into little crisp shoots and are mutilated, if not broken entirely off, while being placed in the ground. Contrary to what some might suppose, it is far more difficult to make the plants go ahead after they have become "started" than before. It may be that the "check" they receive discourages them—at any rate, they seldom start again. It is of the utmost importance never to allow the roots to become at all dried. A half hour's drying wind on the unprotected roots will so impair their vitality as to render the plants worthless. It is best never to plant on a windy day, if avoidable. When the plants are received, take them from the package and place them in a trench previously prepared and close at hand, and cover them well with earth. In such a trench they are perfectly safe and a few can be taken at a time as the planting progresses. A common error is made in planting—that of setting the plants too deep. Do not set any deeper than the plants stood before digging, which will readily be seen by the appearance of the canes (this applies to all sorts, whether Cap or upright-growing varieties), pressing the earth firmly about the plants with the feet. Cut back all canes to six inches from the ground so soon as planted. By repeated trials it has been found that the best distances to plant are as follows; in garden culture, four feet apart each way for the upright-growing sorts; and the Caps in rows five feet apart, with the plants three feet apart in the rows. In field culture, plant the former in rows six inches apart, with the plants three feet distant; and the latter seven feet apart and the plants two and a half feet distant.

Cultivation and Pruning.

All the culture that is necessary is to keep the surface mellow and free from weeds throughout the season (which may be done by cultivator or hoe), treating all suckers as so many worthless weeds, except three or four to each hill, or a single row for fruiting canes. Cultivate on the surface only after the first year or near the rows, for if the soil is stirred to any considerable depth the roots will be broken, causing great numbers of suckers to be produced, much to the detriment of the yield, size and quality of the fruit. A good mulching (one to two inches in depth) placed about each hill or along the rows, in spring is very beneficial, serving the double purpose of keeping down grass and weeds and keeping the ground cool and moist, thereby enhancing the size and quality of the berries and prolonging the season of fruition. This mulch may be salt-meadow hay, straw, corn-stalks, shavings, pine-needles, saw-dust, tan-bark, coal ashes, or even stones, and these are of value in the order named.

It used to be thought that Raspberries could be grown only by staking. Stakes we regard as useless as their use is expensive. When the plants have attained a hight of three to four feet (according to the vigor of the variety) pinch out the central shoot. This will cause it to throw out side shoots, which, when they have grown from a foot to eighteen inches in length, should be treated in the same way. Then by fall a strong, stocky bush will have been formed so stout and rugged that no support or protection will be necessary, and the crop of fruit the following year will be enormous, both in size and quality. To grow in the bush form needs watchfulness, but the labor required is far less than for staking, to say nothing of the cost of stakes, while the results are greatly in favor of plants grown in this way. The trouble and expense of covering for winter are also avoided, as plants grown in this manner mature their wood much better and are rendered so hardy as not to need protection, unless they are foreign varieties. After the fruiting season remove the old wood, and in the autumn, should the young canes have been neglected, cut them back one-third of their length, pruning the strong-growing varieties even more severely, never allowing the canes to stand more than five feet after pruning, under any circumstances.

Winter Protection.

Many fail to prune their plants into bush form and to give winter protection. But protection especially to the foreign varieties, well repays for the trouble of the operation. Winter protection is given in the following manner:—At the approach of cold weather, commence by placing a shovelful of earth at the base of each hill, over which to bend the canes and thereby prevent their breaking. Two hills should be bent towards each other that both may be covered at one operation. If simply held down by stones, bricks or pieces of wood, they will be safe from harm by freezing; but a covering of one or two inches of earth is still an improvement. Evergreen boughs make the best of all coverings, and when the plantation is not large, and these can be readily had, they should be used. Corn-stalks are good also. In the spring, as soon as the ground has become settled, the covering should be removed, the canes raised to an upright position and fastened to stout stakes, one of which, four to five feet in length, has been driven into the ground at every hill. The Cap varieties need no protection, but they should be pruned and staked if not grown in the bush form.

It is best always to plant something of an assortment, so as to extend the season of fruit. The list of varieties offered by nurserymen is so long that any attempt at pointing out the merits and defects of all, could not result otherwise than in bewildering many. We will, therefore, confine our remarks to those which we have found to be especially noteworthy, commencing with the

American Red Varieties,

all of which are moderately hardy in most locations unless the winter should be unusually unfavorable. Being, in our estimation, the most desirable of all raspberries, we head the list with the

CUTHBERT.—This we note has recently been termed "The Royalty of Raspberries." In fact, it is being extensively advertised by one of our leading nurserymen, as "Queen of the Market," and we think the title equally applicable to it in the home garden. Large, luscious, beautiful and exceedingly firm; vigorous, of strong growth, extremely hardy and yielding most abundantly, commencing to ripen moderately early and holding out until all others

THE GREGG RASPBERRY.—From Life.—Fig. 77.

have gone. Although it has now fruited North, South, East and West and on various kinds of soils, it has, as recently stated in the RURAL, yet to develop a weakness, yet to make an enemy. We have, however, spoken of this so fully in former numbers (it being part of our free plant and seed distribution) we refrain from further remarks concerning it.

BRANDYWINE OR SUSQUECO.—As a berry for market, this stands next in point of profit. It is of good size, very firm, of bright, handsome color and very hardy. Its demerits are that it is not so prolific as desirable; the canes are of rather feeble growth (except on unusually rich soil) and its inferior quality. It is very dry and might be said to be almost without flavor. It should not be planted for one's own use, at any rate.

THE TURNER, CALLED SOUTHERN THORNLESS by some, is an exceedingly valuable variety, especially for home use or near-by market. It is as hardy as an Oak, and while of but moderate size, yet it is of a bright, attractive color, and one of the sweetest and most luscious raspberries in existence. It is among the first to ripen; the canes are of strong growth and excessively productive. Being rather soft, it should not be planted by those who have no market except at a distance. It suckers the most profusely of any of the American sorts, and must be watched and the suckers kept down, else little besides plants will be the result.

HIGHLAND HARDY is another early sort, resembling the Turner somewhat in appearance and consistency of fruit, but far inferior to it in quality. Canes hardy in all Northern sections, of strong growth, decidedly productive, and, like the Turner, they are produced in great numbers. We say *Northern* sections, from the fact that we find it does not succeed much south of the isothermal line of New York city, the sun apparently affecting its vitality to the extent of rendering it unable to endure the winter. In some sections, where good markets are near at hand, it has proven highly profitable owing to its early ripening and large yield. It is asserted by some that this is the old Kirtland recently brought forward under a new name.

PHILADELPHIA. — Many of our readers can, no doubt, remember when this was almost the only Red Raspberry cultivated. In reality, this venerable variety has done almost as much to popularize raspberry culture in America as has the Wilson, the Strawberry; or the Concord, the Grape. It is so well known and so rapidly becoming a thing of the past that we deem any description unnecessary. It seems to have deteriorated—either from defective culture or natural inclination, and is not what it was in former years. We wish to say little against this old pioneer, however, as we all owe much to it. While the Philadelphia may pass away in name, it will not in reality—at least the race will not—for it has left many worthy children. Among these may be mentioned the Reliance, Early Prolific, etc. The Montclair, too, reference to which has been made in these columns, from all appearances is an offspring of the Philadelphia, and so far as can be judged at present, of greater value than its supposed parent in its palmiest day.

Foreign Varieties and their Seedlings.

As is well known, the foreign varieties of the Raspberry will rarely endure the winters of America without protection. This we think due more to the heat of summer than the cold of winter, as they seem to be peculiarly affected by the parching sun of our summer months. For this reason they succeed better at the North than at the South—it being a notorious fact that they succeed better north of the isothermal line of New York city than south of it. Therefore anything that will tend to keep the soil cool and moist in summer, should be considered in their cultivation. In this connection we would name, first, selecting for them soil that is naturally as cool and moist, without being wet, as can be had, and, second, planting them in partial shade, as in orchards, by the side of a fence, stone-wall, grape-*trellis* or anything else that will afford shade without *excluding* the sun. They should be invariably covered in winter and unlched in summer. But we do *not* recommend this desirable class for planting south of New York except the

HEUSTINE, and this no farther south than Pennsylvania or Ohio. Taken all in all, this is *perhaps* the finest variety of the class, and is truly a superb berry. Owing perhaps to its American origin (it is generally considered a hybrid between the foreign and American species), it seems better adapted to our climate than most others. It is large, exceedingly beautiful and luscious, but it is not sufficiently firm to bear transportation to distant markets. The canes are of strong, robust growth, fairly productive and will often endure the winters of the latitude of New Jersey unprotected, although, it must be covered to insure a crop. In time of ripening it is quite early.

FRANCONIA is perhaps the next best, taken all in all, either for home use or market. Some assert that it and the Naomi are distinct varieties; but we have never been able to detect any difference, hence we speak of but one in detail. Berries large, handsome, firm, with a rich, brisk, sub-acid flavor, and canes of strong growth, very productive, continuing long in bearing.

BELLE DE FONTENAY, *alias* AMAZON, *alias* HENRIETTA.—In some sections this is the finest of all raspberries. It is a decidedly uncertain variety and we know of no way of ascertaining whether it will succeed or not, except by trying it. Like the other foreign sorts, it is confined to the North as a rule, yet a few years back when found growing by the wayside, at Edesville, Maryland, it was so magnificent that it filled the discoverer with astonishment and he at once commenced building castles in Spain over it. Alas! as is too often the case, the castles soon fell to the ground, but it has from that day to this borne the name of Amazon in many sections, and probably will for years to come. Its berries are very large, deep-red, firm, rich and aromatic. Canes rather short, strong, vigorous, prolific and *hardy* for one of its class. It throws up suckers to such an extent that unless they are kept down, it soon becomes a troublesome weed. By cutting to the ground all the canes in spring and destroying all the suckers, except a few to each plant for fruiting, quite a crop of large, perfect berries will be produced in autumn, especially if the ground be rich and rather moist. Owing to this propensity it is frequently termed a "fall bearing" variety.

BRINCKLE'S ORANGE.—This is such a precarious sort that we hesitate to enumerate it in a list so select. As it is the standard of excellence in point of flavor, however, we give it brief mention. Berries large, orange-yellow and quite soft. Canes tender, but when protected, very productive if the soil suits it. It should be planted for home use only.

Cap Varieties.

All of these being hardy, except at the extreme North, while the fruit is sufficiently firm to bear carriage to market, we omit any further remarks on these points. We have seen them growing beautifully and producing most bountifully on soil so sandy that it would not support grass, and, on the other hand, on land of the heaviest and most compact nature; from which it will at once be seen they readily adapt themselves to soils of all kinds. However, they prefer rather loose, light land than otherwise. Commencing with the season we have

DAVIDSON'S THORNLESS the first to ripen of all the raspberries. Its berries are black, fully medium-sized and of good quality. Its canes are nearly free from spines and the few that appear upon them, are small, insignificant affairs. It is, however, quite an uncertain cropper, hence it is not so popular as

DOOLITTLE BLACK CAP, OR AMERICAN IMPROVED.—This is an early variety also, but ripens a week to ten days after Davidson's which it closely resembles in the size and shape of its berries—its flavor being that of the wild black raspberry. In former years it has been enormously productive and has been the most widely planted of all the Cap varieties; but lately it has been affected by a sort of fungus in many sections, greatly impairing its fruitfulness and value. Its numerous, sharp, stout thorns are an objection to it.

MAMMOTH CLUSTER, OR LARGE MIAMI, also known as the McCormick, ripens quite late, is of very large size and of excellent quality. The canes are of exceedingly strong growth and immensely prolific. Altogether, it is a superior variety and for many, many years has been the best of the class, either for home use or market. It is yet, unless it be superseded by the

GREGG. (See cut). So far as our personal observations go, we have failed to see that this excels the "old reliable" Mammoth Cluster in size, productiveness or flavor. At the West it is maintained by the best authorites that it does in all three of the points named; which we accept as correct, from the fact that immense numbers of plants of it are being planted there by experienced fruit growers. It is, however, jet black, having none of the bluish bloom of the Mammoth; and on this account presents a more attractive appearance in the crate and is preferable for growing for market.

FLORENCE is a Yellow Cap and much the best one of its color that we have yet seen. In size it equals the Mammoth, with which it ripens; is of good quality, and of a bright attractive orange color. The canes are of a strong growth and are great bearers. The berries of this and the Mammoth mingled together form a most appetizing picture.

RECAPITULATION. — Prepare the soil *thoroughly* and as far in advance of planting as circumstances will admit. Plant *early* but *don't* plant deep, pressing the earth *firmly* on the roots. Keep the surface of the ground *mellow* and free from weeds and grass. *Mulch* in summer, *pinch back* during the growing season and *keep down the suckers*. As a single variety for planting throughout the country either for profit or the table, we would name as the best *red* sort, the Cuthbert; the best *black*, the Mammoth Cluster. As the *two* best sorts for garden culture we would name the Turner, (if to be protected in winter the Herstine) for *early*, and the Cuthbert for *main and late crop*. For those who perfer the *black* sorts, we would name Doolittle and Mammoth as the two best for giving an abundance and a prolonged season of fruit.

Field Crops.

BEETS AT THE MICHIGAN AGRICULTURAL COLLEGE.

LAST year a piece of land, rather heavy, gravelly loam that had produced 100 bushels of ears of corn per acre in 1878, was dressed with 40 loads of rotten manure to the acre and sowed to beets. The ground was plowed, subsoiled, harrowed till fine, and seed put in with a drill in rows 30 inches apart, and 148 feet long; land not ridged. After getting well started the plants were trimmed to about 12 inches, and well cultivated through the season.

The varieties and yields per acre were as follows:

	Bush.
Long Red Mangel	1,595
Long Yellow	1,140
Improved Mammoth	1,140
Harris's Improved Yellow Globe	1,104
Yellow Globe	1,014
Norbiton	1,107
Red Globe	1,026
Yellow Intermediate	1,026
Warden's Orange Globe	873
Golden Tankard	684
Red Tankard	360
SUGAR BEETS.	
White Sugar	1,414
Maine Sugar	1,255
Lane's Improved Sugar	861
Vilmorin's Sugar	798

The roots were measured in bushel baskets, well rounded up, as so much dirt adhered to some of the varieties that they could not have been weighed with any accuracy without washing. Five bushels of each kind were buried to test their keeping qualities.

The one called Maine Sugar, is the variety that is grown in Maine for sugar. The sugar beets had many long fibers or roots and grew almost entirely in the ground; some of them could not be pulled with a heavy potato hook, and had to be dug out with a spade. The others grew mostly above ground; the Globe varieties could be pushed over with the foot. I would estimate the cost of harvesting the sugar beet to be at least twice that of the others.

The Long Red, which gave the largest yield, grew long and crooked, was brittle and broke easily. It probably will not be a good keeper. The Harris's Improved was round, smooth, as hard as a ruta-baga, and of the best quality.

The yield, although pretty good, I think can be easily increased 50 per cent. on the same ground, last year being the first time the land was well manured and cultivated.

One such trial, of course, does not determine the yielding qualities of these varieties; it should be repeated many times and on different soils. From my previous experience in growing beets, I have found three things necessary to produce large crops:—plenty of manure, deep and thorough cultivation, and *sowing as soon in the spring as danger of frosts will permit.*

LANSING, Mich. F. A GULLEY.

THICK SOWING OF GRASS SEEDS.

WITH such small seeds as those of clover and timothy grass a large proportion necessarily perish as they are usually sown. They are thrown upon the surface without any covering except the loose dirt which rains wash over them. This is ample if the rains come. Deeper covering would bury the seeds so that few would ever come up. But on an acre of ground, such as most clover seed is sown on in the spring, more than half of the seeds come to nothing in ordinary seasons. The seeds germinate, but fail to get root, and one or two days with drying winds destroy the germ. Something is gained by sowing early while the surface is slightly frozen. The seeds which have the good fortune to fall in the open fissures will be out of reach of winds and will root readily. Good seedings are usually got by sowing at this time. But not one quarter of the seeds will fall even then where they will be in good position for growing. A half or even a quarter of an inch difference in position will insure success or failure of the seeds sown. What falls upon the flat, hard surface packed by rains and impervious to moisture will fail, no matter how favorable the weather may be. If seeding is delayed until the ground is dried, the surface should be thoroughly harrowed before sowing.

But the best rule is to sow thickly. I have always believed in heavier seeding with clover than is generally practiced. One peck per acre is none too much, and there are cases where a peck and a half is still better. Last spring when sowing clover seed, one end of the field seemed rather doubtful, so after going over it once at the rate of a peck per acre, I reduced the quantity one-half and sowed this end of the field a second time. The result was that while almost all the clover seeding in the neighborhood was a failure I had as thick a seeding as I had a year ago when the season was everywhere favorable. From my experience the past year I do not doubt that we can nearly always insure a good clover catch by sowing enough seed—enough I mean to give a sufficiency of plants and yet allow a large proportion of the seed to fail. If the season is favorable no harm is done by thick seeding. Clover will not grow so large when the plants crowd each other, but the stems will not be so coarse and there will be a larger proportion of leaves and fine hay—a larger amount also, I believe. Where clover is thin, weeds will come in, which under the closely matted leaves of a thick seeding would be crowded out. If we can insure these advantages at the cost of a few quarts of clover seed per acre it will be penny wise and pound foolish not to do it. W. J. F.

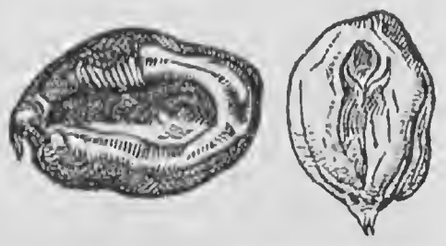
Monroe Co., N. Y.

CUZCO CORN.

THE following letter explains itself:

SAN FRANCISCO, Nov. 17th, 1879.

TO THE EDITOR OF THE "RURAL NEW-YORKER:—*Dear Sir:* I send you a small box containing a pound or more of the wonderful Cuzco corn. You will certainly be much surprised at the size and qualities of this wonderful cereal. I have not the least doubt that it will prove a very great acquisition to our farmers for almost every purpose. It should be planted as far away from other varieties of corn as possible. The province of Cuzco in Peru, S. A., is about 300 or 400 miles inland, and has an elevation of over 11,000 feet. The weather is generally cold in winter and cool in summer, which is very short. A great quantity of rain and snow falls there. I have a plant of it growing in our garden in this city, planted too late (latter part of May, I believe), it is about 15 feet high, has two ears one 12 to 13 inches long, the other 9 to 10



CUZCO CORN.—FIG. 78.

inches long. These ears will not bear any grains, as the pollen from other plants was wanting to impregnate, or fructify them. For a country like some parts of our Great West, where wood is scarce, and where they burn their corn-stalks, this should be valuable corn, as the stalk I have must be from 1¾ to 2 inches in diameter some 2½ feet from the ground. Have a handful of the grain I send you boiled, just as they are, say for 21 hours, and eat them with salt, pepper and butter and you will be surprised. You never tasted hominy as good. Take a few grains and parch them for a few minutes in an oven, and eat them with a little butter and salt, and you will again be surprised. TIBARCIO PARROT.

[Since the receipt of this corn, two kernels ("large enough to be Major Generals") of which we have had engraved, we have also to thank Mr. W. C. J. Drew, of Eldorado, Cal., for a second small quantity. Mr. Drew seems to expect great things of it as well as Mr. Parrot.

Three or four years ago we planted three kernels of this same corn in our garden. We then supposed it was Zea Caragua. It grew to the hight of 11 feet, but had set no ears when frost terminated its further growth, Dr. Thurber, to whom we showed several of our "Major Generals," thinks it can hardly be Z. Caragua which is described as being smaller than Zea Mays (Indian Corn). Dr. Thurber thinks if it be a distinct species, it is very probably Zea macrosperma. It is evidently of no use in this climate. We shall send a few seeds South in order to ascertain if it is worthy of cultivation there as well as to ascertain if, beyond mere size, there is any foundation for a new species.—EDS.]

Farm Topics.

WESTERN FARMING BY A MIDDLE MAN. II.

CHARITY begins at home, and there I judge my comparisons and criticisms of different modes and styles of farming should begin, for such criticisms should at least be "charitable" and kindly in spirit and expression.

I have lately returned from a trip by rail, of some 300 miles, "swinging round the circle" in my own State, going by the Cleveland, Columbus and Cincinnati Railroad through one stretch and style of country, and returning by the Cleveland, Mt. Vernon and Columbus

Railroad, through a region quite distant, totally diverse from the other, going through the most level parts of Cuyahoga, Lorain, Huron, Richland, Crawford, Morrow, Delaware and Franklin counties, and returning through about the most hilly parts of Knox, Holmes, Wayne and Summit, going most of the way through a long monotonous stretch of dead level, with only occasional and slight undulations, and returning through scenery so fine as to remind one of sprightly Vermont hills and valleys, or the Hoosac region of Western Massachusetts, or of the bold scenery of the Alleghanies in Pennsylvania. The January weather was mild and balmy, the fields were bare of snow and free from frost, the wheat and even some of the grass still green, and the whole country spread out to view almost as if in summer. Most of the ground was not new to me, but I found myself again and again saying two things I had often said before. One was, "What a vast and varied State Ohio is!" and the other, "What is there in *hills* that puts life into the farmers, and in a dead level that takes it out of them?"

But my work is not to talk in a moral or poetic strain, but diligently to inquire what excellences may we imitate, and what defects should we avoid in the farming of any locality?

So, then, in riding through the great level stretch first mentioned, I found myself constantly asking, "What does the agriculture of this region chiefly need?" and the answer every time was the same, "Two things, drainage and manure." Not that it is naturally an infertile region: some portions of it are the very garden of Ohio naturally. Huron county and Erie, which adjoins it, are two of the best wheat counties in Ohio. Erie stood first in the State in 1878, giving an average of nearly 20 bushels. But even this fine county sadly needs under-drainage. The waters stood over this great level area long after they had receded from the higher and more hilly portions of the State. The soil is largely alluvial—the settlings rather of the great waters before they finally subsided to the present level of Lake Erie's surface; so, at least, the geologists tell us; and the soil is black and rich, but it is so level that it *must have* drainage of some sort. The open ditches at the roadsides (I speak of the parts of Huron and Erie counties near the lake) are often from two to five feet deep, and into these runs the water from the open ditches or furrows on either side. The wheat fields are plowed in very narrow, high lands, with deep, open dead furrows for the waters to stand and slowly flow in. Of course, this system of drainage is most imperfect and wasteful in many respects. It wastes the fertility of the soil—how, I need not now show. It wastes time in tilling and more in harvesting, and is a fearful strain on any reaper. The proprietors of the Buckeye Reaper told me that they had more trouble from breakage of their table-rake in those and similar counties than in the whole world besides. Tile-drainage must in time replace this superficial and unsatisfactory work.

But further back from the lake, in Richland, Crawford and Morrow counties, the soil, at least from our line of road, seems not so fertile naturally, and there is even greater need of thorough tile-drainage. The water seemed to stand in all the dead furrows and depressions for scores of miles here, and over half of some of the fields, the sub-soil being retentive clay, and the wheat showed the ill effects of it. Still, it is a good, strong, clay soil most of the way, and sufficiently undulating for tile-drainage, provided it be thoroughly and skillfully done. And if thoroughly underdrained and properly tilled and manured, this land will make some of the very best wheat land in the State. Already tiling is well begun, and the factories are springing up everywhere, and a new era in agriculture at the West is already dawning. Portions of these counties, indeed, lying back from my present route, are more undulating and gravelly and less in need of drainage.

Thorough manuring and tillage must, however, follow tilling, or the era I spoke of will dawn all too slowly. I looked in vain through this flat region for the *sources* whence the manure is to come. There were neither stock nor barns nor clover. Not absolutely none, for the agricultural statistics show quite to the contrary, but nothing adequate. I do not remember seeing from the car windows one thoroughly good barn in a stretch of a hundred miles on the C., C., C. and I. R. R. I mean one that looked as if it housed adequate feed and stock for the size of the farm, and planned for the careful saving of every particle and drop of the manure from the animals. Again and again I found myself comparing the farming of this region with that of a certain town in Massachusetts that I visited and studied some six years ago. That town is naturally barren sand, and some of it still remains so. But many of the farmers there have *made* splendid farms. They make their money chiefly by raising stock, or sending good milk and butter to Boston. And they make their *farms* by a scrupulous saving and proper use of every particle of manure, both liquid and solid, from all their animals. Clover is not plowed under, but fed, and the manure saved. Straw is not rotted down, but cut and fed with mill feed, and the manure saved. Their great bank-barns, chiefly with manure cellars, tell the story. Which is cause and which is effect it may be hard to tell exactly, but one thing is certain: the bank-barns are usually on good farms. In that town the neglected farms with tumble-down barns one would be slow to take as a gift, the land seems so absolutely infertile. But farms even adjoining, with the good barns and the good farmers, would be cheap at a hundred dollars an acre. And as I thought it over I said to myself, "If these men make such farms out of such miserable land, why should we be discouraged with the naturally fertile soil found almost anywhere in Ohio. I found also a kind of conundrum slowly "evolving" itself from my sluggish brain. It was this: What is the best and safest "bank" for farmers? Ans.—The *bank-barn*.

But of the picturesque scenery, and the fine farms, and the lessons learned on the homeward trip I must speak at another time.

W. I. C.

THE LAW ON LINE FENCES IN NEW YORK.

F. K. MORELAND.

The law relating to line fences is a matter of some interest to farmers. Disputes in reference to them are too often a prolific cause of discord and sometimes of litigation. A farmer will guard his line fences with jealous care, not only to insure their being properly located but also to insure their being efficient. The statute law upon this subject is all-sufficient. It is provided in substance that each of two adjoining land-owners shall make and maintain a just proportion of the division fence between them. Any land-owner may permit his land to be open and unfenced; but when such owner sees fit to fence his lands, he shall pay to the adjoining owner the value of the division fence, or rather his just proportion of it at the time such division fence was erected by the adjoining owner. All disputes in reference to fences shall be submitted to two fence viewers whose decision shall be final. No farmer may remove his portion of the division fence without giving due notice.

There is another question which will arise most frequently in the older sections of the country, where land is more valuable; and that is as to correct location of line fences. When land was less valuable than now, farmers were careless in locating their division fences. They were very often crooked and too often erroneous; and now when this may cause an error of several acres in the survey of a man's farm, it becomes an interesting question. When a fence has been located for twenty years between two farms, the statute of limitation intervenes, and says *that* is the fence. The parties have acquiesced too long in that line fence for one to disturb the other. The object and aim of all statutes is to prevent litigation. And this is the object of the statute of limitation—it is a statute of repose. The party who acquires any land by the erroneous location of a line fence, acquires a good title by prescription. This principle has been decided too often by our courts to be overruled. In Jackson vs. Dyoling, 2 Caines, 193, the Supreme Court decided that "A possession of 40 years or an acknowledged, though erroneous line, is a good bar to recovery in ejectment. A parol agreement to abide by a certain division line, will be sufficient to prevent either party from claiming in ejectment contrary to it, though it will not pass the lands, but such agreement may, it would seem, be revoked or modified by a a subsequent parol agreement." In Dufert *vs.* Couroy, 1 Hume, 609, the following language is used: "The referees having found as matter of fact in an ejectment suit, that, for more than 40 years, the lots of the respective parties had been separated by a partition fence; that the lots had been used and cultivated by their respective owners for more than 30 years up to the fence on each side; that in 1869 plaintiff's agent moved the fence two feet on the lot occupied by the defendant; that in August 1871 defendant removed the fence to where it stood before and brought an action and recovered damages against plaintiff for removing the fence; *held*, that it was error to find as conclusion of law, that the plaintiff was owner of the strip of land between the fence, as it originally stood and as it stood after its removal by plaintiff." To the same effect is Robinson *vs.* Phillip, 56 N. Y. (Court of Appeals) 634, and Pope *vs* Hammer, 74 N. Y. 240. When a division fence has stood for upwards of 20 years, undisputed, even if not openly acknowledged or even if not located by the joint act of the adjoining owners, there is no reason or justice in removing it. It would seem that the statute of limitations (20 years) is a sufficient length of time in which to correct its location.

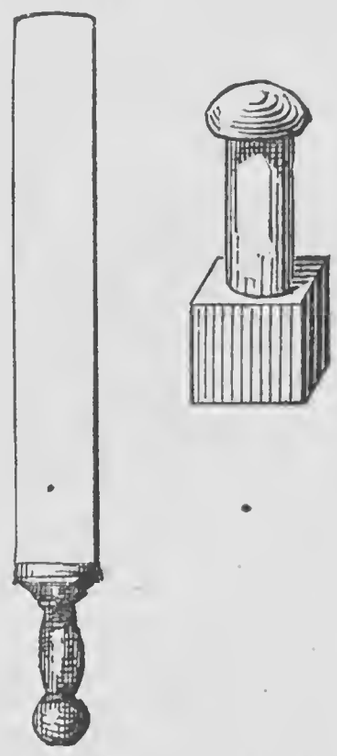
It is not often that any grievous injury will result from allowing the old line to remain. One principal object in correcting the line fence is to have it straight—neighbors can usually agree upon this. I know of cases where the old line has been piled full of boulders and stones, where neither party could wish to change the line.

St. Lawrence Co., N. Y.

Dairy Husbandry.

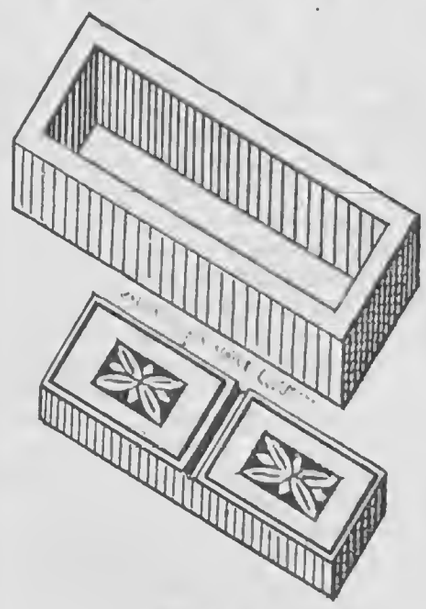
BUTTER PRINTS.

Once, while on a visit to a very noted dairy near St. Louis, I saw the butter maker print butter nearly as fast as a man can mold bricks at a brick-yard. He had a six-sided frame open at top and bottom and larger at the top than at the bottom. In the bottom of this frame he would insert a false or loose bottom with the monogram of the dairy cut on it. He would



BUTTER KNIFE AND RAMMER.—FIG. 79.

then force the butter into the mold with a small rammer and with a long slim wooden knife, he would "strike" or cut off the top of the butter just even with the surface of the mold. Quickly reversing the mold, with his two thumbs he would push the false bottom and butter out upon a cloth already spread to receive them. The false bottom was removed from the butter and the ends of the cloth drawn neatly over it, and then the same process was gone over again. I weighed many of the prints and found them as nearly an exact pound as they could have been weighed by the most practiced hand. I afterwards adopted the same principle, but with a slightly differently shaped mold at my butter factory with complete success—see fig. 80. Butter in rectangular shapes will pack closer in a box than in any other form. It is also very easy to divide into half pounds either on the counter or for the table, one full pound being usually too much to put upon the table at one time.



BUTTER PRINT.—FIG. 80.

There is no reason whatever for requiring the butter maker to weigh every pound of butter. It is not only a waste of time and labor; but if the butter is packed solid in the mold, as it should be, an exact weight can be arrived at with greater precision by "striking" than with the scales. In weighing, the last ounce must be dropped on, and how hard the scale goes down depends much upon how much salt brine or rust has gotten on the hinges or points of balance. Besides, very few dairymaids, or men either, are slow and cautious enough to measure closely, and most of them prefer to throw on a half ounce too much than either to lose the time and patience required to make closer measure or to take the risk of a complaint coming back from the store. Good butter-making is made up of little things, and this is one of the biggest of the little things when a whole year's waste comes to be recorded.

The above tools should all be made of cherry wood and the frame put together strongly with brass screws that will not rust. The paddle, however, may be made of white ash and the longer and wider it is the better. The false bottom should fit quite loosely at first, as it will certainly swell after being used a while. On the face of it any figure or monogram may be cut and on the back four brass screws can be inserted to regulate the size of the print of butter.

L. S. Hardin.

DAIRYING-HOCUS-POCUS.

T. H. Hoskins, M. D.

The mysteries of milk to the popular mind are various and manifold. "Witches in the cream" have sufficed to excuse much ignorance and many blunders among the dairy-maids. But fondness for the marvelous in this connection is not limited to the unlearned. I have recently been making a collection of agricultural text books used in European schools for primary instruction, and in reading them I find, in regard to dairying at least, a good deal of vulgar error taught for truth. In the "Agricultural Class-book," published by Alexander Thom, Dublin, Ireland, (3d. ed. 1870), not only is shallow setting (3 inches) at a temperature of 56 deg. insisted on, but we are told that "at a higher temperature it takes a shorter and at a lower temperature a longer time," and that "at 34 deg. to 37 deg. milk may be kept three weeks without throwing up any notable quantity of cream." In the same treatise we are also told that "churning consists in breaking up the coats of the fatty globules and setting the butter free," and that "this is effected by the combined effect of friction, heat and air." All this is repeated *verbatim* in a book entitled "Introduction to Practical Farming for the Use of Schools," published in London, 1875, by MacMillan and Co.

Cold setting and box churns have blasted this "learning of the ancients," but new crops of absurdities spring up on the same ground on both sides of the Atlantic. Among those I am compelled, very reluctantly, to include the widely quoted declaration of Dr. Sturtevant, (in Land and Home), to the effect that Jersey milk is an unwholesome diet, not only for human infants but for Jersey calves! "The cause at the bottom of this difficulty," says the Dr. in italics, "is the difficulty of digesting the curd of Jersey milk." But he also ascribes it to the richness of the milk by reason of the excess of butter it contains. He cites no instances of babies being slain with Jersey milk, but he refers in proof to a "well-known complaint among Jersey breeders, over that of the breeders of other stock, that their calves scour to a troublesome degree." I have a pretty wide acquaintance among Jersey breeders in Vermont, and have never heard this complaint, nor do I believe the disease spoken of is any more common among Jerseys than among our common cattle; while wherever it occurs it is simply to be ascribed to bad management. As a great many "Jersey breeders" in Southern New England belong to the class of "fancy farmers," who have to depend upon hired help in rearing their calves, and as the calves are very rarely allowed either to suck their dams or have whole milk for more than a few days after birth, it is easy to surmise the probable origin of the complaint where Dr. Sturtevant has heard it, without resorting to the explanation he provides for it.

There is no doubt that Jersey milk is richer in both casein and fat than that of most other breeds. It is richer in all its solid constituents, merely because it has less water. We have not the slightest reason for believing that there is any other difference, or any, at least, of a character to lessen digestibility. The writer in his professional practice has long been in the habit of recommending Jersey milk in preference to any other for infants "brought up on the bottle," and never has seen any evil results that could be fairly ascribed to the milk. His own child, now 17 months of age, has been so reared, (the milk of a cow making one pound of butter from 12½ pounds of milk, being used exclusively), and this child is and always has been a picture of health. As the parents average 46 years in age, and the babe weighed but six pounds at birth and now weighs 38, I think it is a pretty good showing for Jersey milk.

But the most remarkable and self-stultifying statements in this connection, that have lately come under my notice, are those made by a correspondent of the Boston Cultivator in relation to the effect of mixing the milk of various breeds, or of different cows, upon the yield of butter. If true, they would practically lead to the necessity of churning every cow's milk separately, no matter how large the dairy might be. For with the multitude of dairymen it is practically impossible to get together any considerable herd without having in it cows varying greatly in the size of their butter globules. And, besides that, every cow's milk contains both large and small globules, so that in fact we should, on the theory propounded, have to "split the milk," in order to get all the cream. Let us examine these statements a little, and see how they contradict themselves in the eyes of a practical man. The writer be-

gins by saying that it would naturally be supposed that if ten Short-horns are giving a yield of 65 pounds of butter a week, the addition to the herd of two Jerseys making 20 pounds a week, would raise the product to 85 pounds. But this, he finds, is not the case. On the contrary, he asserts that the mixture of the two qualities of milk has been found to sensibly reduce the yield." In support of this statement, the experience of two or three skillful dairymen is given. One of these says:

"This fall, when my herd was making a given quantity of butter weekly, I added to the number of my cows two high-grade Jerseys. I soon found, on weighing my butter product, that the addition of the two Jerseys made no perceptible increase over the previous quantity of butter. I concluded at once that my Jerseys were at fault, and would not make the amount of butter supposed. The latter were new milch cows, and very promising animals in appearance. I next set the milk of each of the suspected Jerseys by itself, and found that the yield of one made twelve pounds of butter, while that of the other made but a little less; also that the original herd, upon careful and repeated test, yielded as before."

Another dairyman who has twelve cows in milk, the majority of which are Jerseys, obtained from cream which ought to have produced 70 to 75 pounds of butter but 38 pounds. The next week he kept the cream of his grade Jerseys and Short-horns separate, and with eight days' cream instead of seven, as in the previous experiment, he obtained 83½ pounds. Both of these dairymen are thoroughly convinced that it is not well to mix the milk and cream of different breeds.

A third dairyman, whose herd was composed of about equal proportions of grade Jerseys and Short-horns, and who is a firm believer in high feeding and the most careful attention, could get only about five pounds of butter per cow weekly. Finally he concluded to set the milk and churn the cream of each cow separately, and found that he had not a single cow that gave less than six pounds, while several yielded upwards of nine pounds each!

Now I undertake to say that these so-called experiments are of no more value, and no more entitled to credit, than would be the assertion of a party who should declare that water out of two adjoining wells would not, when poured together, produce as much ice, or as much steam, as when used separately. Take the first "experience," and what does it in fact tells us? That when two high-grade ("new milch") Jersey cows were added to a herd, the herd made no more butter with them than without them! Yet these Jerseys separately made nearly 24 pounds of butter a week! The whole number of the herd in this case is not stated. We are not told whether the milk was mixed, or only the cream. But whichever course was taken, the entire product (say 23 pounds) of butter from the Jerseys was lost. Did it prevent so much cream from rising, or did it prevent so much butter from coming in the churn? This is a very important question which apparently no experiment was made to decide. If the cream was prevented from rising, we have a singular physical phenomenon presented indeed—no less than the suspension of the laws of gravitation through the influence of Jersey milk. If the cream having risen, did not "come," we then have the hardly less singular phenomenon presented in the refusal of Jersey cream to yield butter, or else of its power to keep just so much as its own weight of butter, and no more, in the cream of the other cows from "coming." If the twenty-three pounds of Jersey butter had "come," and the rest had not, we might suppose that the Jersey cream was a little more prompt than the rest, and that more churning would have brought it all. But no. That Jersey butter, the exact amount, utterly disappeared, and could not be found!

I do not hesitate to say (and I think there are few intelligent dairymen who will not agree with me) that this story is utterly false on the very face of it. And the other cases quoted are like unto it.

I say this not on rational grounds alone, though they are sufficient. I have made a considerable number of experiments to test this very matter, and have uniformly found that when large-globuled milk is mixed with small-globuled milk, the rising of the cream of the latter is accelerated, and also made more perfect. Experiments in the churn have also shown that, when large-globuled cream was mixed with small-globuled cream, the butter came more quickly and more perfectly than with small-globuled cream alone. In each case, by microscopic tests, there were fewer cream globules left in the skim-milk and in the butter-milk than were found in the skim-milk and butter-milk of the same small-globuled milk when set and churned separately, under like conditions. I have no doubt that this will always be found true when the operations of the dairy are, in other respects, properly and intelligently conducted.

Miscellaneous.

WHAT OTHERS SAY.

MR. FINLAY DUN ON AMERICA.—The following notes are taken from Mr. Dun's essay as read before a Farmers' Club of England. Our readers will remember that he is a special correspondent whom the London Times appointed to look into our agriculture. We have read the entire essay with great interest and we doubt not the following pithy, carefully selected, will interest and instruct our readers: The millions, he says, thus made in each recurring year from the bountiful earth have been the chief cause of the recent boom in our industries. The money made in wheat growing and stock raising has been rapidly circulated. When one-fourth of the population [one-half would have been nearer the truth. EDS.] which are more or less directly connected with agriculture, have thus prospered, the remainder of the community speedily participate. In the Old Country, with greater amount of accumulated wealth, and a greater variety of long-established industries, business proceeds at a tolerably uniform pace throughout the year; but in the New World, so predominant is the agricultural interest, that so soon as harvest is secured, business makes a bound, millions of dollars are dispatched West for payment of wheat and cattle. The fall trade in all sorts of goods is double that of the spring; for three months after the farmer gathers his golden grain, wholesale and retail merchants, railways and bankers, have their busy time and their harvest. Never was this more notably illustrated than during last autumn, when, after a most bountiful crop had been reaped, all descriptions of agricultural produce rose with a steady upward rush.

The cattle need and receive little attention; they range instinctively in quest of the best food and water, sometimes spreading over 50 or 70 miles; on some runs salt is provided. Smaller owners have 1,000 to 2,000 head; some of the cattle kings number their 40,000 to 50,000. The chief expenses are the wages of the stockmen and shepherds, who receive $25 to $32 per month (£5 to £6 10s.), with lodgings and rations. Each man looks after about 1,000 head, and in the larger ranches more. There are great diversities amongst the thousands of cattle reared over these vast areas. All are undergoing steady improvement. Lank, rough, profitless brutes are disappearing; the scalawags are polished off. Well-bred bulls of Short-horn and other breeds and well selected grades are introduced from the Eastern States. One gentleman told Mr. Dunn in October that he had himself bred, bought and forwarded West, 1,000 young Short-horn bulls during the last three years. To insure the advantage of such imported sires and prevent the incursion of errant Texans, inclosures are being made in some localities. The Texas cattle, which now muster 5,000,000, are not generally *beau ideals* of symmetry or quality. They are narrow, often open in the loin, leggy, rough, with big heads and enormous horns, hard handlers, and often of a sickly yellow color.

BUT the great breeding and grazing regions of America, where the herds and flocks are so rapidly increasing, and where there is still so much room for increase, are upwards of 1,000 miles west of the Atlantic. One hundred and fifty miles west of Omaha on the Union Pacific, where seven railroads converge, the great cattle ranches begin, and extend 500 miles through Nebraska and Wyoming over the Laramie Plains to the Rocky Mountains, and still 1,000 miles west through Utah and Oregon to the Pacific. Southwards the stock raising is being prosecuted for nearly 1,000 miles through Colorado and Texas to the Gulf of Mexico, and north fully 800 miles through the rich, partially occupied plains and valleys of Wyoming and Montana to the international boundary, and far beyond it into the Canadian Dominion. Twenty years ago these vast regions were unsurveyed; only a few white hunters had penetrated among the Indians; the land was tenanted by bison, elk, deer, and antelope. Since 1860, it is stated that fifteen million bison or buffalo have been killed, with a proportionate number of smaller game. In their place the herds and flocks are slowly extending, but there is room and to spare.

FROM Cheyenne, Julesburg, and other such stations 1,000 car-loads of cattle are annually despatched. Mr. J. W. Iliff, from his big range, 150 miles long and about half as wide, on the South Platte River, now every year forwards 15,000 beasts. The cows each average $25; the best for slaughter weigh, when hung up, 600 pounds to 700 pounds. They are classified in the trade as Texans good natives, butchers' cattle, and feeders. Sold on the hoof or by live weight, they vary from about two and one-fifth to three cts. per pound. They are forwarded in large numbers from Council Bluffs to Chicago, a distance of fully 1,000 miles. Twenty beasts are put into each car, which is covered. In the journey they are thrice unloaded, fed, watered, and rested during twelve to twenty-four hours. The cost of this long journey is $6.77 for each beast. They are forwarded from Chicago (800 miles) to New York for $3 87 extra. When quietly driven to the railway, carefully loaded, and properly fed and rested in transit, accidents are rare and loss of condition slight. Beasts conveyed by rail 1,000 miles and weighed out of the trucks before feeding and watering, will have lost on the gross 50 pounds to 80 pounds.

SHEEP, Mr. Dun says, are increasing throughout the States at the rate of 1,000,000 annually, and now reach nearly 40,000,000. In many parts of the country they are of Mexican origin, crossed with Merino grades. Hitherto they have been bred much more for the production of wool than of mutton. But now that our own as well as foreign markets are opened for mutton, Oxford and Shropshire, Downs, Cotswolds, and Leicesters are being introduced, and the lank, thin bodies, big heads, and close, fine wool are undergoing transformation. American mutton, however, is not so good as American beef. There are great tracts of the continent which, owing to the extremes of winter cold and summer heat, are not well adapted to the thriving of sheep. They have often to be housed during three or four months in winter, and this, besides adding materially to the cost, interferes with vigorous thriving. British flock-masters may therefore be assured that for the present, at any rate, their important business will not be seriously injured by American competition.

BUT the same comfort Mr. Dun thinks cannot be administered to British pig-breeders. The swine of the United States and of Canada are quite as good as at home. They roam healthily at large over plain and prairie, in wood and orchard; they are fed on the best of provender, often on apples and peaches. In the States they number 35 millions. Berkshire and other English breeds, and a useful China hog, are cultivated. He did not see an indifferent grunter during the whole of his travels. They cost often less than four cents per pound; 60 per cent. of the hog products are now exported; hundreds of tons of bacon and pork are sent to British ports at six cents per pound; and England's national bacon bills reach annually $50,000,000.

THE Oregon cattle are more shapely, and have less daylight underneath them than those of Texas. Oregon now numbers about half a million cattle and 2,000,000 sheep, but has area and pasturage for twenty times these numbers. Large drafts are brought eastward over the mountains to be grazed for a year in Wyoming and Nebraska, where the two-year-olds are disposed of at about $15. Into Montana, in the very center of the American continent, both cattle and sheep since 1873 have been steadily extending; the cattle now number about half a million, and the sheep probably about the same.

IN the discussion which followed the reading of this paper, from which we have no space for further notes, Mr. Phipps M. P., remarked that his spirits agriculturally were much higher than they were before he heard Mr. Dun's paper, for it now appeared that the very worst of the outcome of American competition was that the English farmer must be content to produce meat at 15 cents per pound. He thought that as far as meat was concerned, that was not a very bad prospect; and if it could be laid down, as Mr. Dun seemed to indicate, that wheat, to pay, could probably not be sent to this country for less than 40s. or 42s. per qr., (about $1.21 to $1.27 per bu.) he could only say that the message from America was better, as far as farmers were concerned, than he had anticipated. Many in the room, Mr. Phipps had no doubt, could remember the time when good beef was not worth more than 3s. to 3s. 6d. per stone, and that was in a time when American competition was but little thought of. They might depend upon it that if they should be blessed with average good seasons and if the commercial depression of their country should be removed, and if trade and commerce improved and reached the successful position in which they were some few years ago, thus causing a great improvement in the means of the consumers of agricultural produce, then the agricultural producer of the future would have, after all, not so very melancholy a look-out. He, Mr. Phipps, believed that at the present time there was such depression existing in connection with agriculture from various causes—from cattle diseases, from bad harvests, and from bad seasons—that owing to no fault of their own, hundreds and thousands of respectable and at one time well-to-do agriculturists would have to bear the brunt, and would be unable to keep their engagements.

THE great and growing railway system of the States largely contributes to our power of economically sending our trans-atlantic friends every second loaf they eat and supplementing it with a rasher of bacon and an occasional beefsteak. We have 100,000 miles of railways, and are adding annually some 5,000 miles, and this year will add fully 8,000.

WITH such temptingly low rates, no wonder Mr. Dun thinks that American flour is imported in increasingly large quantities, showing in 1879 an excess of 37 per cent. on the imports of former years, and that English millers are anxiously inquiring into and adopting many of the more recent improvements of the best American millers.

CATALOGUES, ETC., RECEIVED.

ROBERT DOUGLASS & SONS, Waukegan, Ill. As the planting season approaches, we call particular attention to this trustworthy old firm. It proposes again the coming year to send trees *by mail* in small lots to all who may order them, at so cheap a rate that no one may hesitate to buy and plant trees and thereby ornament their homes and lay a foundation for future benefit. For ONE DOLLAR they offer to send from 50 to 100 trees to any person, the trees varying in size from four to twelve inches in hight. Among them we may mention the European Larch, White Ash, Hardy Catalpa, Scotch Pine, &c. We *know* from experience that these trees are carefully packed, and that with ordinary care every one will live and grow. The same opportunity has never been offered before that we know of by any other firm, and we confidently advise our readers who stand in need of such trees to order them. Catalogues and circulars giving all needed information will, no doubt, be furnished on application.

BAIRD & TUTTLE, Bloomington Nurseries, Bloomington, McLean Co., Ill. This old and extensive establishment covers 600 acres, thirteen greenhouses, and 10,000 square feet of frost-proof cellars. They have testimonials that their fruit trees, shrubs, small fruits and other plants have been received in Mexico, Nova Scotia, Oregon, &c., in perfect condition. Their catalogues will be sent free to applicants.

HOOPES, BROTHER & THOMAS, West Chester, Pa. We take much pleasure in commending this firm to our readers. They will send their Illustrated Hand-Book without charge to all of our readers who apply. All who love new and choice plants should send for it.

ELLWANGER & BARRY, Rochester, N. Y.—Their lists of new Roses, of fruits, greenhouse and bedding-plants, &c., will be sent as announced in their advertisement.

Industrial Implements.

THS EMPIRE GRAIN AND FERTILIZER DRILL.

We have had frequent inquiries as to the best grain drill and also as to the best drill for distributing fertilizers at the same time the seed is sown, and in the Empire Grain and Fertilizer Drill here illustrated, we present to the careful attention of these inquirers and of all our other readers an implement of this kind which long experience has shown to be second to none on the market. This is a force-feed drill, well defined as one whose mechanism takes positive control of the grain or fertilizer and carries it irresistibly forward to the point where it empties into the funnels or conducting tubes. As a grain drill its chief merits are: Its force-feed arrangement certainly forces the grain from the feed box to the ground, so long as any grain remains in the box; its hopper bottom is a supplement to the feed run, and by its conformation to the sides of the seed-box above, and the shell or disc of the distributor beneath, materially aids in distributing the grain in a regular, continuous stream. It is the combination of the hopper bottom with the disc of the distributor, and the manner in which the grain is received into it and discharged, that imparts to the device the power of positive force.

There must be an even, continuous stream of grain discharged, so that by the forward movement of the drill over the ground it will be deposited in a regular manner in the drill furrow, with no danger of being thick at one place and thin at another.

Fig. 82 represents the hopper bottom, which consists of triangular blocks of wood inserted in the space between each distributor in such a manner that a complete hopper is formed from the top of the seed-box to the point at the bottom of the run where the grain is raised to the discharging aperture, offering the least possible resistance to the downward movement of the grain, and guiding each and every kernel. Fig. 83 shows a sectional view of the feed run filled with grain, by which the force principle is very plainly indicated. The moving or lifting power is the rotating disc with a flange on the outer circumference provided at certain intervals with ribs or starts, as seen in the cut. The grain is received upon this flange

almost immediately upon leaving the seed-box and is carried forward to the discharging aperture and emptied into the funnels, or conductors, in an even, continuous stream.

As a fertilizer distributor its chief claims are: it distributes any kind of commercial fertilizer with certainty and uniformity, without danger of clogging or bunching; the quantity sown is regulated by the gear, so that there is no guess-work on this point; the box can be filled with any phosphate which will be discharged evenly and regularly; the phosphate

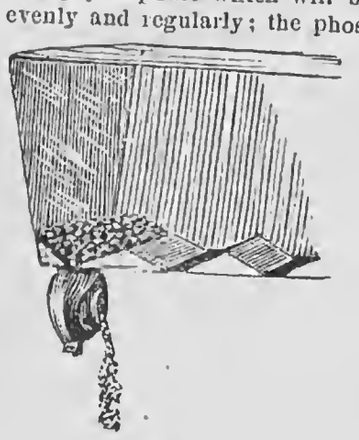


FIG. 82.

does not accumulate at one end of the drill when working on a side-hill; composed of few pieces, it is not liable to become disarranged; and while held firmly together, it can be quickly and easily taken apart, without removing a nut, key or spring; by automatic action, produced by raising and lowering the teeth, it is thrown out of gear before the teeth are out of the ground, and they are in the ground ready for work before it is thrown into gear, thus avoiding any waste by scattering on the surface of the ground.

Fig. 84 represents a perspective view of this feeding device with the side of the cup broken

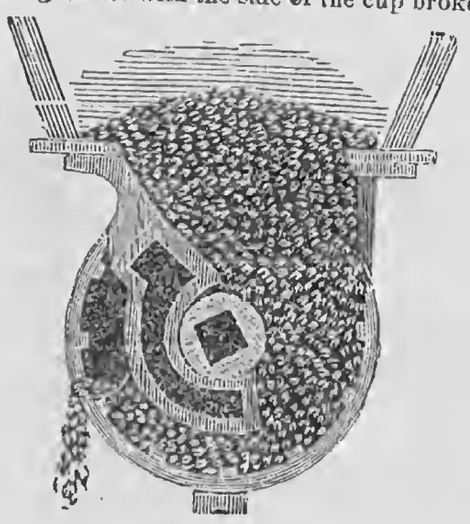

FIG. 83.

away, so that the inside and feeding cap, with cut-off wire, are disclosed, showing the opening in the cap through which the fertilizing substance is carried and discharged into the spout below, and by it conveyed to the conductors.

This device is composed of four pieces: 1st. The stationary bottom plate, or support, which is screwed fast to the under side of the drill box, and upon which the whole mechanism rests. 2nd. The revolving bottom or carrying plate, with cogs on the under side, upon which

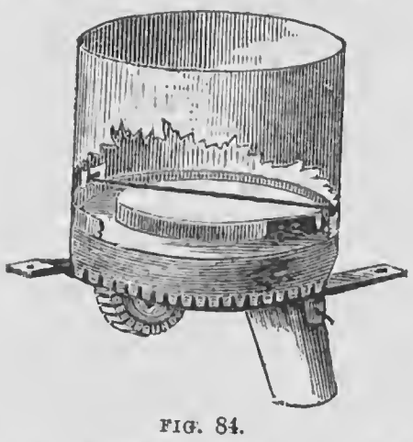

FIG. 84.

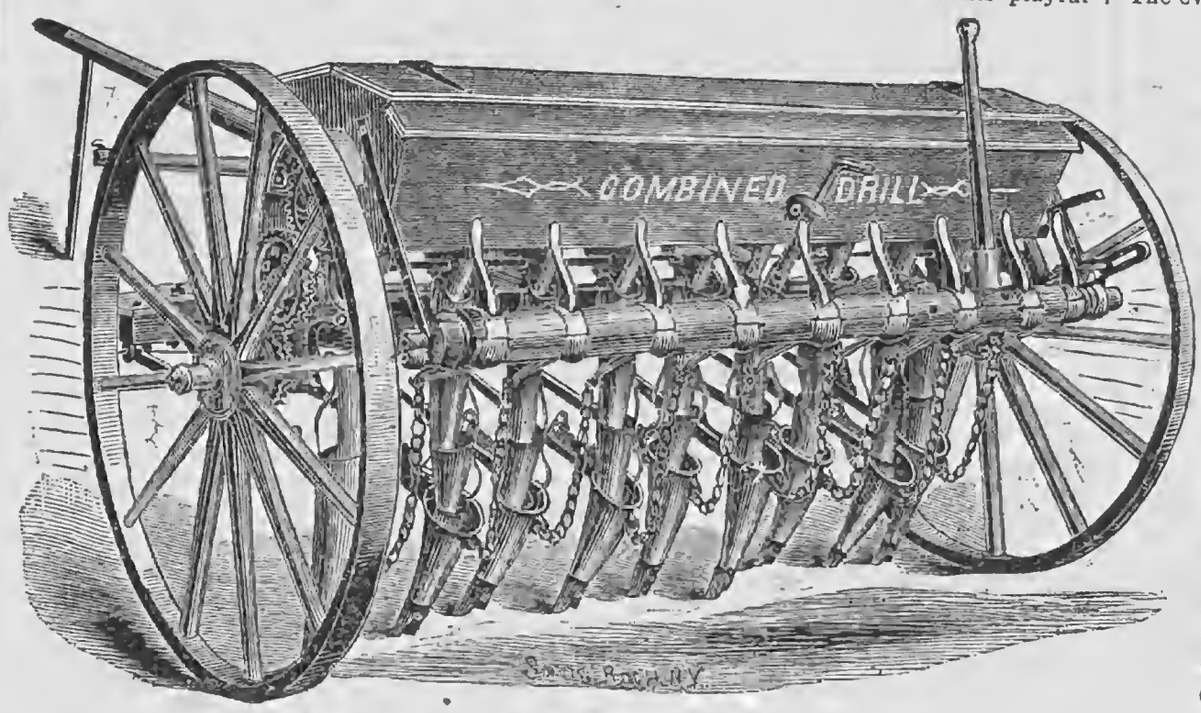
rests the revolving cylinder of the fertilizing substance. 3d. The feeding cap; and 4th, the zinc top riveted securely to the revolving bottom plate, to form a cup, or receptacle, which, when at work, is full of phosphate. These different parts are made of sufficient weight to be durable and substantial, and, with the exception of the zinc cup, which is riveted, are held together firmly without the use of a bolt, key, or spring, and, at the same time, are quickly and easily taken apart if there be any cause or reason for desiring to do so.

For fuller particulars of this really excellent implement we refer our friends to the manufacturers, the Empire Drill Company, Shortsville, Ontario Co., N. Y.

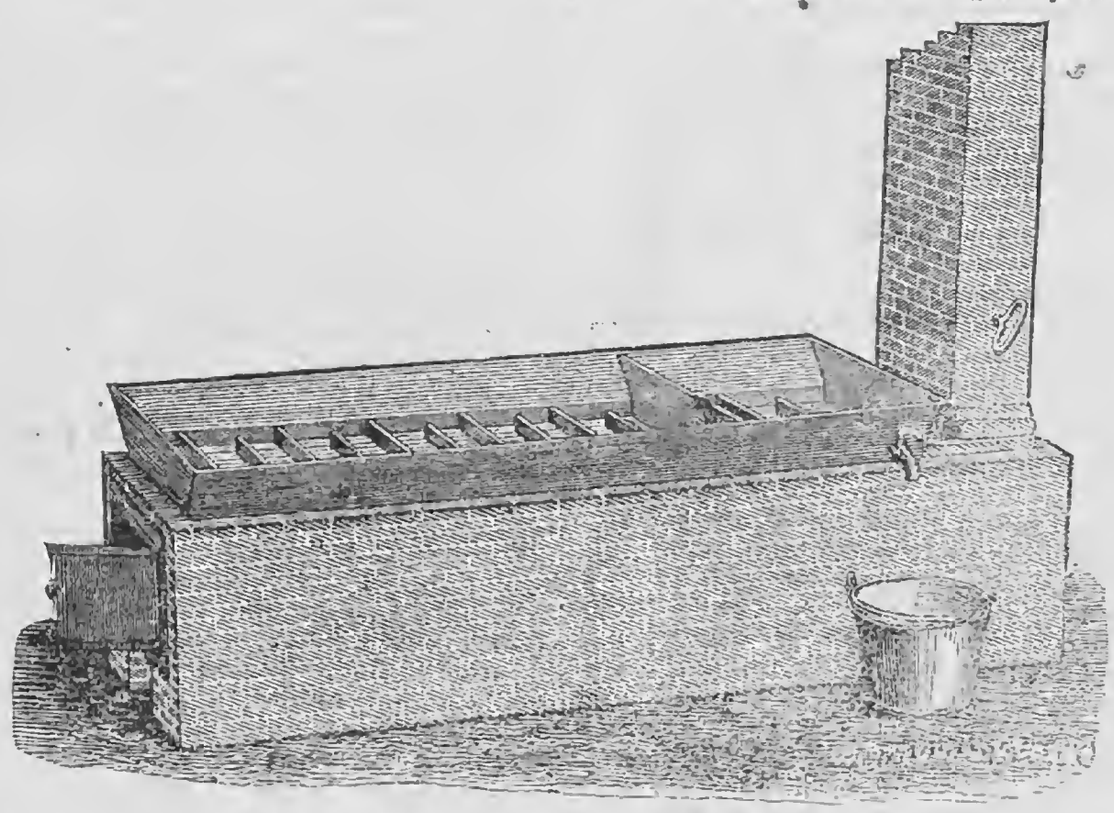
EVAPORATORS FOR SUGAR MAKING.

THE evaporation of saccharine fluids for the manufacture of sugar is an important operation, because not only the quality but the quantity of the product depends upon it. Domestic sugar making promises to become greatly extended since the recent improvements in the



EMPIRE GRAIN AND FERTILIZER DRILL.—FIG. 81.

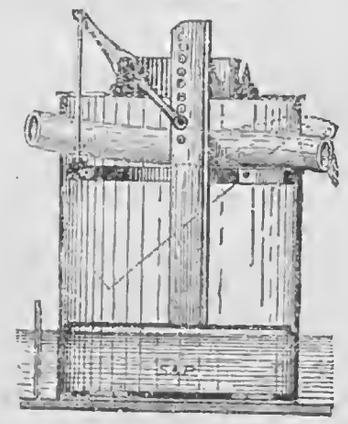
reduction of sorghum juice to crystallized sugar, and the maple sugar industry may soon be eclipsed by the development of this kindred product. By and by every farmer may be his own sugar maker, and this indispensable article of domestic consumption may be made on every farm. But cane-sugar, whether from sorghum of any variety, or from the true Southern cane, can never drive maple sirup or sugar from its place as a household luxury. No other sirup possesses the peculiarly agreeable flavor of maple sirup, and no cakes of sugar will ever be so acceptable to the American youngster as those made in the maple groves. It is a misfortune for us, that in the very practical improvements of the present age, all the poetry of farm life is disappearing, and the rotund, jolly farmer of years ago, who gleefully swung his flail while "the eager and nipping airs" of winter played and sang about the corners and through the logs of the old-fashioned barn, and who, on the approach of spring, hied to the woods with his playful brood about him to make sugar in the old camp and pull candy cooled in the snow, now gives place to the thin-visaged "Gradgrind" who declares that, "Facts; facts, sir! prove that machinery must take the place of hand labor, and that all the future work of the world must be done by steam." Then, alas! good bye to all the fun by which labor was lightened and the young folks amused while they helped to do some profitable work! But maple sirup and sugar cakes and candy will be made, and all the better, too, although the old iron kettle hung on a tripod in the style of a gipsy camp, be relegated to the pile of old iron, and a brand-new evaporator from the Vermont Farm Machine Company be procured from Bellows Falls, Vt., to take its place.



VERMONT FARM MACHINE CO'S. EVAPORATOR.—FIG. 85.

Every device by which the quality of a product is improved is valuable, and it is a well-known fact that the rapid boiling of maple sirup is an important element in securing an excellent quality and a clear, light amber color. The evaporator referred to (see fig. 85) has several new and valuable points; the sap enters where the heat is greatest, viz., over the fire hole, and leaves the evaporator where the heat is least, thus avoiding scorching; the sap flows in a tortuous stream from the front to the rear, and the sirup may be finished off in the lower end of the pan, which can be separated by a gate from the front part. Fuel is saved because the heat is all utilized, and this also secures rapid boiling down. Rapid boiling prevents the formation of the so-called inverted or uncrystallizable sugar, which remains in the sirup and also secures a fine grain and a light color. This not only increases the product of sugar but improves its quality and adds to its salable value, which is of considerable importance when it is remembered that in Vermont alone 15,000,000 pounds of maple sugar are made annually. One cent a pound added to the price of this quantity makes $150,000, and three cents, a very possible additional value gained by the use of this evaporator, will make nearly half a million dollars. This is an example of the benefits derived from any improved machine or device by which an increased value is given to any product or any labor is made more effective.

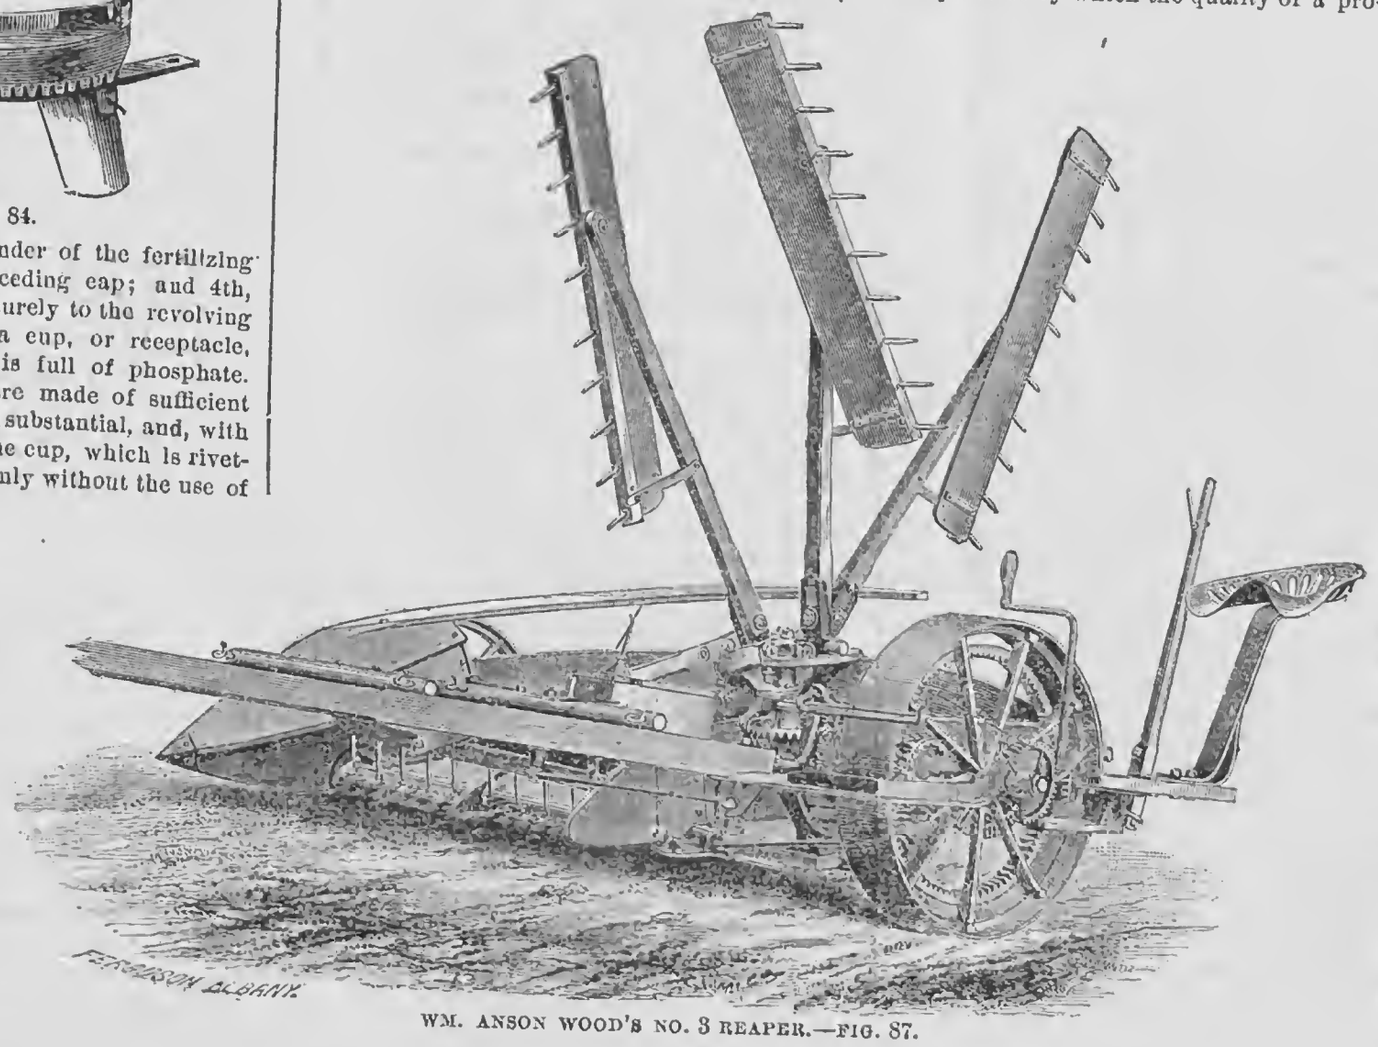
The best evaporators are made of copper and lined with tin; these are found to be very desirable for boiling down cider into jelly, as they are perfectly safe, acid having no action whatever upon the metal. An ingenious automatic feeder is supplied with this evaporator (see fig. 86). This being placed in the evaporator, the sap as it rises, lifts the float, works the lever and depresses the arm which is under the rubber feeding tube. This arm being pressed down, as shown by the dotted line, chokes the tube, as shown by dotted lines, and stops or decreases the flow until more sap is required, when the tube is released again. This is an important adjunct, as, so long as the supply tube or barrel has any sap in it, no attention is needed to keep the boiler furnished adequately. This evaporator may be used for making Amber cane sirup, and sugar as well as for maple sirup, and as Amber cane promises to be largely used for this purpose, the machine will doubtless be extensively called for.



REGULATOR FOR EVAPORATOR.—FIG. 86.

THE WM. ANSON WOOD'S NO. 3 REAPER.

An examination of a new reaper lately put upon the market by the Wm. Anson Wood Mower & Reaper Co., of Albany, N. Y., shows that this firm has accomplished the difficult task of adding another to the numerous improvements made in the reaper since the first clumsy machine excited the wonder, admiration and hopes of the agricultural world. The advance in the line of betterment in the present case is mainly in greater ease of handling. By the new arrangement, the driver, from his seat, has perfect control of the machine, being able with a quick movement of the hand to set the platform and the rakes in any desired position instantaneously. This facility of adjustment makes this an exceptionally efficient machine for reaping lodged and tangled grain and delivering a perfect gavel under all conditions. An ingenious device in the shape of a break-like crank, a little to the right and in front of the driver's seat, works an eccentric which raises or lowers the cutter-bar and table and tilts forward the rakes so that they pick up the grain cleanly. Just back of the crank is a tilting lever which adjusts the rear platform at any desired angle. Owing to these devices the driver need never quit his seat while at work; and stubble is cut at a uniform hight either close to the surface or as high as 16 inches from the ground. Although the machine weighs only 750 pounds and is of very light draft, yet so nicely is it balanced throughout and so fine are the workmanship and materials, that it runs with great smoothness and precision and with a minimum of friction. The drive wheel has a wide tread, and all the desirable features in the machine are firmly secured by no less than 15 patents. We strongly urge our readers to investigate all the claims confidently asserted for the reaper, and seek full information concerning it from the manufacturers at the above address.



WM. ANSON WOOD'S NO. 3 REAPER.—FIG. 87.

Everywhere.

PROGRESSIVE MOVEMENTS IN OHIO.

We are modest people in Ohio. We do not boast of what we have done or intend to do in the line of agricultural improvements; but I will gently hint to the RURAL readers in other States, that we are not disposed to lag behind in the onward march. There has never been a time when the minds of our farmers were so generally alert to discover what can be done for the improvement of their farms or families; for it an accepted maxim that our sons and daughters are the noblest products of the land. This mental awakening of the rural population is, no doubt, largely attributable to the social and educational influences of the Grange organizations. It is also both a cause and an effect of the increased circulation of agricultural papers.

The Use of Commercial Fertilizers

is another grand educational agency among our farmers. The influence these were seen to exert upon the wheat crops especially, compelled the old-fogy class of farmers to lay aside their prejudices against scientific farming, and to admit that something valuable can be learned from reading; and thus the eyes of thousands have been opened to admit the light of science. So rapid has been the increase in the use of these fertilizers that it is found that on careful inquiry the amount of sales, the past year, of superphosphates and ground bone, was about 13,000 tons, and it has nearly doubled in the past two years, with the prospect of still further increase. This involves an aggregate outlay of over $500,000 per year on the part of the farmers; and it is beginning to be learned that there is *cheating* in this trade—that a considerable share of the so-called phosphates are poor *trash*, not worth half their cost; and there is no way of detecting the frauds but by chemical analysis. We propose, therefore, to have passed by our present legislature a fair and stringent law to protect the farmers and honest manufacturers from sharpers in the trade. This has already been attempted twice, and failed, but will succeed this time, or I'll miss my guess.

An "Experiment Station"

is the next thing we mean to have; and it really ought to be the basis of our fertilizer law—as it doubtless will be when established. The class of farmers, numbering 93, who were in attendance at the course of agricultural lectures at our State University in January, presented an able memorial to the Legislature, asking for such a "Station" to be connected with the University. Petitions for the same are also being sent in from a number of Granges and neighborhoods of farmers. But the project is so new to most of the people, as well as to members of the Legislature, that it is not expected to pass before another winter. When our Station gets in operation we shall expect to see all the other States follow suit—and if a few get ahead of us in the race, all right.

A Boom for Tile-Draining!

The great clay districts of our State, like the dairy region of the "Reserve," have been manifestly declining in productiveness for years past, not so much on account of any real impoverishment of the soil, as because of the need of a more thorough and diversified system of tillage, and it has been found that this can only be rendered possible by tile-draining a large portion of the land; and this operation causes wonderful improvement. A convention of tile-makers and advocates of land-draining was held at Columbus last week. There were more present than I expected to see (about 70), and the proceedings were highly interesting and useful. Professor Townsend, of the University, expressed gratification on being present, and gave an interesting narrative of his experiments in tile-draining on a clay farm in Northern Ohio, over 40 years ago. He also gave an excellent lecture on the philosophy and benefits of tile-draining clay lands. The Secretary of the State Board of Agriculture furnished a series of extracts on the results of tile-draining, copied from the reports of the secretaries of county Societies, and designed for the forthcoming Report of the State Board. But the best of all was an essay written by W. I. Chamberlain, and read in his absence by the writer, on the question "Does Tile-Draining Pay?" The essay is a plain narrative of the experience of the writer in his efforts, with no capital but brains and muscle, to renovate an old clay dairy farm that was thought to be fit for nothing but grass, and to be incapable of yielding any profit at that. But as a consequence of tile-draining one field after another, it has become one of the most productive and valuable farms in all that section of the State, yielding immense crops of wheat, clover and potatoes as well as hay, and the value of the land has increased three-fold. This essay was written for, and read in a Grange meeting where most of the neighbors of Mr. Chamberlain were present; so there can be no doubt of the correctness of its statements. It also contains reference to the like marvelous effects of tile-draining on the clay farms of John Johnston and one or two others near Geneva, N. Y., where Mr. Chamberlain visited the past summer. He thus not only shows most conclusively that tile-draining *does pay*, but that it is the very foundation or *ground-work* of improvement of these old clay farms; and that the owners of such lands really cannot afford to defer engaging in this work, for the longer they delay the less able they will be to accomplish it. This essay, with the rest of the proceedings of the Convention, will be published in the March number of the Indianapolis Drainage Journal, and extra copies will be sent to the members of the Convention, for distribution. The hope was expressed that the essay would be extensively read at Grange meetings and the like, in all the clay districts of the State.

A Tile-Drain Organization.

About 50 of those present at the Convention were makers of tile or of tile machines, and nearly all were farmers of clay land, who had tried or seen enough of tile-draining to be convinced of its importance. Much discussion was had on the form, size and cost of tile; the best kinds of clay for their manufacture; on methods of mixing and grinding the clay, and drying and burning the tile, etc.; the aim being to devise such improvements as would tend to lessen the amount of losses from cracking, etc., and thus enable the makers to reduce prices to the farmers. A very common mistake is in the location of a factory where the clay is not suitable. Mr. J. W. Penfield, of Willoughby, who is the oldest tile and machine maker in the State, said he made it a rule never to send out a tile or brick machine until samples of the clay had been sent to him for trial and inspection, so that he could know just what the machine was wanted to do, and could adapt it to the work. The average prices at which smooth, round tile are sold at the factories in Ohio were said to be 20 cents per rod for 2-inch size, ($6 per 1,000 pieces,) and 10 cents per rod, or $3 per 1,000 additional for each additional inch in size of caliber up to six inches. A few factories located favorably as to cost of clay and fuel, and using cheap labor, were selling somewhat below these prices, and some considerably higher.

An association was formed of 56 members, called the "Ohio Tile Brick and Drainage Association." The president is S. N. Titus, of Marion; vice-president, Peter Swartz, Columbus, and Secretary, Daniel Hess, Columbus; annual meetings to be held at Columbus, 2d Tuesday of Feb. A premium of $25 will be paid at the next annual meeting to the person in Ohio who lays the largest number of rods of tile drain in a perfect manner the present year. M. B. BATEHAM.

RURAL SPECIAL REPORTS.

ARKANSAS, Eldorado, Butler Co., Feb. 25.—We have been having one of the most delightful winters I ever experienced. Wheat is looking well but needs rain before we get the next month's winds, which are apt to blow out the wheat when the ground is dry. Market quiet; wheat, 80 to 95c. per bushel; corn, 20 to 25c.; oats, 30c.; potatoes, 75c. to $1. Hogs, live, $3 25 to $3 55 per 100 pounds; fat cattle, $3 50 on foot; butter, 20 to 25c.; eggs, 7c. W. I. B.

NEW YORK, Elmira, Chemung Co., Feb. 23rd.—With the opening of February came a decided change in the weather. It grew suddenly cold and it was thought then that the month would be the coldest of the winter. But, contrary to expectations, after a week of genuine winter weather, during which time we had fair sleighing, it grew warmer again and in a few days the ground was bare of snow and the river free from ice. Warm weather and muddy roads were again the rule, so that teaming, which had been pushed rapidly forward during the week of sleighing, was suspended. Feb. 18 brought another change and the muddy roads became rough and "putty." Since then it has become warm again and to-day it is warm and spring-like. Unquestionably the warm weather has been a great saving to many farmers in this locality. The short supply of forage last fall, occasioned the necessity of commencing foddering very early and some farmers have already found it necessary to buy feed for their stock; but a less amount of feed has been required than in a keenly cold winter; nevertheless there will be little surplus of hay and coarse fodder left over in this section. Hay has made a little advance of late and is now selling for from $13 to $16 50 per ton. Loose oat straw brings $10 and $12 per ton. The bare, open winter has been unfavorable to small fruits as well as to winter wheat. Strawberries that were not well protected have suffered materially and Raspberries have been frozen down somewhat, not by steady cold weather which seldom injures them, but by the alternate freezing and thawing. A meeting of the Chemung Co., Agricultural Society, was held in the Elmira Court House on the afternoon of Feb 18 for the purpose of electing officers and transacting such other business as was deemed important. Mr. Jessie Owen, of Chemung, was elected president, Mr. W. A. Ward, Secretary, and Mr. Wm. T. Post, Treasurer. A large attendance of members from nearly every section of the county was present. The annual fair of the Society will be held on the 22nd, 23rd, 24th, 25th, of September. The Society wisely resolved to allow teams to enter the grounds free of charge. The Society is in possession of a sorghum sugar machine which it resolved to give to any person in Chemung Co., exhibiting the best 100 pounds of home-made cane sugar. A handsome premium will be given as a prize to the best samples of tobacco exhibited at the September fair. A prize of $10 will be given for the best bushel of potatoes and five dollars for the best five-pound sample of butter. Much interest was shown in the production of sugar of sorghum. Numbers present guaranteed at least 20 acres of cane for sugar. A resolution was passed requesting the Assemblyman from this county to secure the passage of a bill to provide a bounty or prize of $50,000 for the 5,000,000 pounds of home-made sugar. G. A. G. JR.

NEW YORK, Walden, Feb. 25.—Warm, showery weather; frost nearly out of the ground; quite a scarcity of hay, sells from $14 to $18 per ton. Oats, 50c.; corn, 60c.; one sale of 165 bushels wheat at $1 45. Winter grain looks fair. Wages are expected to rule from $3 to $4 per month above last season's; a very general advance in real estate; three creameries are being erected in this part of Orange county. Several engaged in furnishing milk for New York market will change to butter. Times are fair and to the industrious and careful agriculturist the prospect is more cheering than for the past few years. RURALIST.

OHIO, New Antioch, Feb. 27.—We are having an exceedingly mild winter in this part of Ohio; very little snow, but little freezing and a great deal of rain. The wheat crop that is now sown bids fair to be a very good one, with a very large acreage sown. The mild weather of this month is giving the farmers a good chance to prepare for spring work. N. B.

VIRGINIA, Essex Co., Feb. 26.—We have had so far an unusually mild winter, with very little snow. The ice season is over and very little has been gathered in the county. Very little rain. Wheat is looking, we fear, too well, especially if we have cold snaps in May, as we usually have. I see a great deal about Cow Peas. They are a crop with us so old that the oldest inhabitant knows nothing of their earliest cultivation. We plant them in lots, say one foot by two and a-half, four to six in a hill in every second hill in the rows of corn. We also sow them broadcast in the corn the last time it is worked, and if the season is not too early, gather a fine crop of peas and vines, and if the cold weather is too early for the peas to mature there is no better stock food than the vines. I am now feeding to my cows and sheep such as I raised in my corn. OBSERVER.

VA., Herndon, Fairfax Co., Feb. 25.—We are having very warm weather—the frogs are singing while I am writing. We have had a remarkably warm winter; not many like it in the recollection of the oldest inhabitant. Grass and wheat have kept green and growing all winter. Wheat looks fine and bids fair for a good crop. I have been here 12 years, and have never seen as good a prospect for a good crop as now. Hay is rather scarce owing to the short crop caused by the severe drought in the early part of summer. The corn crop was good and corn is plenty—worth about 50 cents per bushel here, and 55 to 58 cents in Alexandria and Washington, D. C. Money is scarce and business dull at this time. Trade has been very good, however. S. K.

The Querist.

ANSWERS TO CORRESPONDENTS.

Onion Culture.

C. J. B., Manchester, Iowa, and *B. F. S., Erie Co., N. Y.*, both ask questions concerning the culture of onions. 1. How should the soil be prepared? 2. The best varieties to sow, and how much seed to the acre? 3. What advantage is there in planting sets, and how should it be done? 4. What yield can be expected per acre on rich soil with good culture?

ANS.—1. Onions should not be sown on a very heavy, clayey soil, or on very light sand; a rich, mellow loam, free from grass roots and weeds, is best suited to this crop. As necessary requisites to success, we will mention:—first, rich soil; second, good seed, and third, clean culture. If these three things are secured and the details of the work are properly attended to, one may reasonably expect to harvest a good average crop. If a good coat of manure has been plowed under in the fall, it will not be necessary to plow the land again in the spring. If it has not been thus treated in the fall, however, it should now be manured and plowed about four inches deep. Thorough pulverization is of first importance. Harrow the plat lengthwise and crosswise of the furrows until the surface soil is fine and mellow, and if necessary construct a scraper of a plank about twelve feet long, and level off with this. Should the surface be uneven, a heavy shower soon after seeding is apt to wash the seed into the hollows, and, of course, cause a failure in the crop. There is a diversity of opinions as to the kind of manure best suited for onions, some growers preferring one kind, others another. Ordinary barnyard manure, pig manure, Peruvian guano and fish guano, all have their advocates, but probably there is nothing better than night soil where this can be obtained. It should be thoroughly mixed with dry earth and worked into the soil with a cultivator. When superphosphate or Peruvian guano is used, it should be applied at the rate of about 1,000 pounds to the acre; half of it to be raked in at the time of sowing and the other half when the onions are four inches high. The seed should be sown as early in the spring as the land can be prepared; about the middle or latter half of March is not too early between the 43d and 44th degree of latitude. Sow in drills, 15 inches apart. Either mark out the whole plat with a marker, or use a drill that marks the rows as the operator proceeds, care being taken to make the rows straight. The seed-drill should be set to drop about five seeds to two inches. The proper depth to drop is from half an inch on heavy soils to about three-quarters of an inch on light sandy land. Good seed is essential. To secure the best result use only American-grown seed, and purchase this either from the grower direct or from a reliable seedsman, and not from peddlars or small local dealers; about five pounds will be needed per acre. 2. The three standard varieties are White Portugal, Yellow Danvers and the Red Wethersfield. Which of these to choose for the main crop, must depend upon the demand of the market to which they are shipped. In Boston the Yellow Danvers is a favorite, while in most Western towns a large red onion is preferred; in New York a white medium-sized onion takes at present the highest price. 3. The object in planting sets is to get an early crop. By the middle of June sets will have attained the size of ordinary onions, and can then be marketed. It is not advisable to make this the main crop, as these onions do not keep well and the market is quite liable to be overcharged with the article. They are planted in rows 12 or 15 inches apart, and three inches from each other. From six to ten bushels are needed per acre, according to size. 4. About 300 bushels per acre may be considered an average crop.

Special Potato Fertilizers.

E. A. G., Hartford, Ct, having a piece of turf land plowed last year and planted with potatoes, with a liberal amount of stable manure in the hill, asks, 1, could a good crop of potatoes be expected from the same ground this year by using commercial fertilizers and without stable manure; 2, what fertilizer or fertilizers will produce the best results, the above ground being a light, mellow loam.

ANS.—1. Surely, yes, if there be any virtue in concentrated or commercial fertilizers. With a slight difference, we propose to raise potatoes under the same conditions. 2. We can give no better advice than to suggest the use of special potato fertilizers which are offered by dealers. If you *knew* that your land was already well supplied with one or more of the chief ingredients of such manures, then the others could be purchased separately at a saving. For instance, if potash, an essential manure for the potato, were not needed, bone or lime phosphate would produce the same results as if both phosphoric acid and potash were applied. See our market reports and advertising columns for names and prices of suitable fertilizers and for the names of reliable dealers.

Treatment of Wheat in Spring.

F. W. S., Baden, asks, 1, what is the best fertilizer for wheat in the spring; 2, how much should be applied and when; 3, what is its price; 3, is it beneficial to harrow wheat in the spring and at what time should it be done; 5, would it be advisable to run the mowing machine over it, if its growth is too great.

ANS.—1. The best fertilizer for spring use is superphosphate of lime; 2, 250 to 300 pounds or even 500 pounds per acre may be applied as early in the spring as may be convenient. 3. The price varies from $30 to $45 per ton. 4. Harrowing wheat in the spring is beneficial; it loosens the soil, kills young weeds, and invigorates the crop. It should be done as early as possible but not before the ground is dry. If clover seed is sown it should be done immediately after the harrowing. 5. It would be of no benefit to mow the tops of the wheat unless it is very thrifty, if the mower is used it should be set to cut at least three inches high and should be employed at once.

Keeping Butter.

W. S. H., Deweyville, Utah, asks how butter can be kept for five or six months—it is made

by about 20 different persons, all good butter makers.

ANS.—The butter will probably vary in color and should, therefore, be well mixed. A good mechanical butter-worker (see advertising columns for makers) may be used. The butter should be cut up and mixed as evenly as possible and run through the worker. If color is needed this may be worked in. As the butter is cut up it should be washed to take out some of the salt, and fresh salt be added in the working. Care should be taken not to overwork it so as to injure the texture. The flavor and the keeping quality will be improved by adding an ounce of white sugar to each four pounds of butter.

Miscellaneous.

S. O., Dobyville, Ark., has a two-year-old mule that in going down hill travels badly and seems afraid of falling at every step. His appearance is that of a foundered horse, but he is not foundered. While in the lot he stands apart as if looking at something in the distance, lifting his feet frequently as if they were sore. He is stiff, dislikes to move about, and is slightly lame in one shoulder. He still travels up-hill "tolerably" well. Lately it was found that he had "blind teeth" and they were knocked out. Some say he has "big shoulder" and for this one inquirer has been advised to give three grains of arsenic per day for some time, and this he is now doing, but he is not satisfied either that "big shoulder" is the disease, or that he is using the proper remedy.

ANS.—The going down hill with difficulty and up hill easily, point strongly to navicular disease. This would also account for every other system mentioned. Try the frog with a light hammer; if the animal winces, the disease is certainly in the navicular or coffin bone. Arsenic is of no possible use. The treatment proper in this case is to poultice the feet or make the animal stand continually in a puddle of clay frequently moistened with hot water. When whatever heat exists is removed, blisters should be applied to the front and sides of the pastern or a seton be passed through the frog. As to put a seton in the frog is a difficult operation, to avoid injuring a tendon it should be done by a competent surgeon. The seton is introduced in the hollow of the heel and brought out about the center of the frog. While this is being done the animal must rest.

A. S., Langersville, N. Y., asks, 1, how many cows can a Short-horn bull of 17 months, serve without injury; 2, should guano in the hill with corn be covered, or should it and the corn be placed in the hill right together; how much should be used in the hill; 3, how long should his pure blooded cock and pullets be shut up away from the rest of the flock to insure pure-blooded chicks.

ANS.—1. The young bull may serve 25 cows during the ensuing year; beginning moderately at first. 2, No seed should come into direct contact with guano or any other concentrated fertilizer; nor should guano be thrown on to a hill of young corn or it will burn the spire. The fertilizer should be mixed with the soil before the seed is dropped. One ounce to the hill is sufficient. 3, Three weeks. It is a question not yet settled if the connection with an impure-bred cock does or does not permanently affect a pure-bred hen.

A. G., Salt Point, N. Y., asks, 1, how to cure a sheep's caked bag which has been so since she weaned her lamb: 2, how to rid a six-years-old mare of worms, which cause her to rub her tail; 3, how can hickory nuts be kept over without spoiling.

ANS.—1. Bathe the udder with warm water and rub on it a mixture of one drachm of iodide of potassium and one ounce each of water and glycerine. Give the ewe a dose of one ounce of Epsom salts and if the hardness of the udder does not decrease soon, repeat the dose after four or five days. Give one pint of linseed oil, and one ounce of turpentine, and repeat in a week. 2, Give an injection of salt and water by means of a syringe, or a bladder with a pipe of elder wood made to fit the mouth of the bladder. 3, Keep the nuts in layers of dry earth in a box of suitable size.

B. F., Homebrook, Pa., asks 1, which is the more profitable—to haul stable manure three miles at 50 cents a load of 3,500 pounds, or to plow under green crops and use fertilizers; 2, does it pay to sell dressed pork at $5 per 100 pounds when shelled corn is worth 75 cents per bushel.

ANS.—The stable manure in this case would be cheapest. 2. It does not where the pork is made wholly or nearly so with corn. When corn is 75 cents per bushel, pork should sell for not less than $6 per hundred, if made on corn. When the pig can be grown on cheaper feed, it will pay to finish off with corn on the basis stated. Fattened partially, at least half on roots or milk, pork can be made at a profit at $5 per hundred when the corn is worth 75 cents.

A. H. & S., Galway, N. Y., ask 1, how to analyze soils and manures, the best books on chemistry and the price; 2, where to obtain a copy of Genesee Farmer for Oct., 1850.

ANS.—You cannot learn to analyze soils and manures with any satisfaction short of a good course in general chemistry. Miller's two books, Inorganic and Organic Chemistry are as good as any; price about $4.00 each; can be had through book stores. 2. We do not know.

E. S. B., Ontario Co., N. Y., asks for the experience of some farmer who has tried phosphate on sandy soil.

ANS.—The following from B. C. Underhill, Locust Valley, L. I., will probably give him all the desired information:

LOCUST VALLEY, L. I., Dec. 25, 1879.

BOWKER FERTILIZER CO., *Gents:* The following report shows the result of using Stockbridge Manures the past season:—

	Cost.	Yield.
Stockbridge on Potatoes, 200 lbs. on ¼ acre	$5	20 bbls.
N. Y. Stable Manure, 20 loads " " "	11. 15	"

One row with no manure of any kind, ½ yield of stable manure.

	Cost.	Yield.
Stockbridge on Corn, 400 lbs. on ½ acre,	$9. 70	bush. ears.
N. Y Stable Manure, 35 loads " " "	19.25 85	" "

To this should be added $3 for carting stable manure.

	Cost.	Yield.
Stockbridge on Wheat, 300 lbs. on ½ acre,	$6.75	12½ bush.
N. Y. Stable Manure, 30 loads " " "	16.50	10½ "

Add to this $3 for carting stable manure. No difference in stand of grass.

Stockbridge on Rye, 400 lbs. on 1 acre, cost $9, yield 22½ bushels. Straw very tall and stiff. Weight 1 ton.

B. C. UNDERHILL.

K. T., Albion, Ill., asks where can porcelain nest eggs be had.

ANS.—At most crockery stores There is a carbolic nest egg which poultry fanciers recommend highly as tending to rid the hens and nests of vermin. They are sold for about $1.50 per dozen, Poultry supply or crockery houses sell or can supply them.

J. N. J., Mt. Vernon, O., sent us some Nantucket pumpkin seeds last season to be tested and he now asks how they turned out.

ANS.—We raised about one dozen from the seed sent. They were of all sizes and shapes—some of them resembling in appearance rather the watermelon than the pumpkin. They seem to us nearly worthless.

W. P. G., Chicago, Ill., asks whether Clematis Jackmanii will stand a temperature of 20 below zero.

ANS.—If covered the vines would stand 20° below zero. We do not think the roots would suffer. It is an excellent plan to cut back all Clematis in the fall and cover with brush or litter.

M. L. M., Holmes Co., Miss., asks where the Nansemond potato can be had, and at what price.

ANS.—They will be found in many of the catalogues referred to in our columns. The price is from 50 to 75 cents per 100 plants.

D. C. W., Viola, Ia., asks where can he get some tea plants or seeds.

The Poultry Yard.

TURKEYS.

HENRY HALES.

OF all the good new things that Europeans gained through the discovery of this continent the turkey stands one of the foremost. He is, in fact, the king of birds, when his size, adaptability to all climates, plumage, and delicacy of flesh are considered. He certainly would have made a better national emblem than the thievish bald eagle, which steals from the fish hawk; and better than the golden eagle would have been, as that is a native of both Continents. There are several varieties of turkeys, the magnificent Honduras, our American wild ones, and in the domesticated kinds, we have the bronze, black, white, buff, and other colors. There is but little doubt that all domestic varieties originated from the wild turkey of the United States, and of these varieties, the Bronze are nearest to the wild birds in color and size. They are the heaviest and are probably the hardiest. In every way the Bronze turkey is *the* turkey.

I cannot lay too much stress on the importance of size in breeding turkeys. Nothing is gained by breeding from the youngest or smallest birds. As turkeys are not at maturity until three years old, it is much the best plan for those who want fine, large birds to breed from those that are fully matured. What would a farmer gain by breeding together for a number of generations half-grown cattle, or pigs, or any other stock? He would certainly expect their size to be materially lessened; it must be so, too, in any stock. Selling all the biggest turkeys because they weigh and sell for a little more than the smaller ones, is poor policy. Suppose you sell at 18 cents a pound five large birds weighing, say, 25 pounds, and keep five weighing five pounds less, you get $4 50 more for the larger birds. Now, should you raise 20 young birds the next year from the small ones, they would weigh less at a given time (say about November) than they would have done if larger or raised from five matured or larger birds. Up to that time of year, they get most of their food in the fields, so that the less they weigh the less profitable they are. If the 20 young birds each weigh five pounds less, you have 100 pounds' weight less, worth, at eighteen cents per pound, eighteen dollars. Deducting the $4.50 taken for the extra size of the five birds sold and perhaps a dollar saved on a little less food than the five larger birds would have eaten, the loss amounts to $12.50 by breeding from the smaller birds; for the larger birds are of no more trouble to look after than the smaller ones.

The best way is to have a gobler not related to the hens, of as fine matured stock as can be procured, with good large two year-old hens which are better than one-year-old birds, if extra size is wanted. One gobler is enough for six or eight hens; but some prefer not to allow him more than four or five. The hens delight to lay in quiet places where they are least likely to be disturbed; it is best to watch them a little, and if they take a fancy to any outbuilding, sometimes a nest box put up in it will keep them from laying astray; but should they lay astray, they should be watched, that the nest may be looked after, as they generally lay more eggs than they can properly cover some of which may be set under a hen or otherwise disposed of, but it is most important to find a sitting turkey's nest to see that it is kept clean, as sitting birds often break eggs and foul the nest, destroying the whole brood. The nest can be cleaned while the turkey hen is off feeding.

Many people labor under an impression that a hen or turkey will hatch and raise more young ones when left to a stray nest without interference, thinking that as such habit is a nearer approach to nature, it must be the correct way. But what does nature do as to increasing numbers? In a state of nature, the whole feathered tribes about hold their own in numbers from one year to another. This will not satisfy the breeder of domesticated birds and animals. If a farmer has five hen turkeys, he must raise more than that number to pay him for his trouble, and here is where the secret of success comes in—*care*.

Young turkeys are very dainty and require frequent changes of food; when first hatched, chopped hard-boiled eggs and bread crumbs are best. Curd, chopped meat, lettuce, and onions (wild green onions will do), corn meal, wheat middlings, buckwheat, are all good. The birds soon get tired of any one food and must be watched to see that they keep eating, for they sometimes starve with one kind of food only before them. Put the mother in a roomy coop, set a few boards around to make a yard in which the young ones can get their luxuries without running into danger, and in about three weeks, when they can get over a ten-inch board, they may have their liberty in fine, dry weather.

THIRTY-FIFTH ANNUAL REPORT

OF THE

NEW YORK LIFE INSURANCE CO

OFFICE, Nos. 346 and 348 BROADWAY.

JANUARY 1, 1880.

Amount of Net Cash Assets, January 1, 1879.....$36,213,457.61

Less deduction to cover decrease in value of U. S. Bonds and other assets..... $135,966.93

$36,077,490.68

REVENUE ACCOUNT.

Premiums	$6,382,875.25	
Less deferred premiums Jan. 1, 1879	379,839.09—$6,003,036.10	
Interest and rents	2,339,875.93	
Less interest accrued Jan. 1, 1879	306,225,93—$2,033,650.00—$8,036,686.16	
		$44,114,176.84

DISBURSEMENT ACCOUNT.

Losses by death, including Reversionary additions to same	$1,569,854.22	
Endowments matured and discounted, including Reversionary additions to same	1,015,256.22	
Annuities, dividends and returned premiums on cancelled policies	2,236,379.07	
Taxes and re-insurances	173,608.64	
Commissions, brokerages, agency expenses and physicians' fees	626,253.30	
Office and law expenses, salaries, advertising, printing, &c	307,392.81—$5,928,745.16	
		$38,185,431.68

ASSETS.

Cash in bank, on hand, and in transit (since received)	$1,961,701.48	
Invested in United States, New York City, and other stocks (market value $14,356,192.94)	13,544,671.96	
Real estate	4,974,573.68	
Bonds and mortgages, first lien on real estate (buildings thereon insured for $14,287,000.00 and the policies assigned to the company as additional collateral security)	15,313,278,95	
Temporary loans, (secured by stocks, market value $1,300,000)	850,000.00	
*Loans on existing policies, (the reserve held by the company on these policies amounts to $3,160,000)	621,403.02	
*Quarterly and semi-annual premiums on existing policies, due subsequent to Jan. 1, 1880	367,989.02	
*Premiums on existing policies in course of transmission and collection (estimated reserve on these policies, $330,000. included in liabilities)	211,625.23	
Agents' balances	22,199.23	
Accrued interest on investments Jan. 1, 1880	317,989.11—$38,185,431.68	
*A detailed schedule of these items will accompany the usual annual report filed with the Insurance Department of the State of New York.		
Excess of market value of securities over cost		811,520.98
CASH ASSETS, Jan. 1, 1880		**$38,996,952.66**

Appropriated as follows:

Adjusted losses, due subsequent to Jan. 1, 1880	$225,662.64
Reported losses, awaiting proof, &c	213,271,31
Matured endowments, due and unpaid	32,780.98
Reserved for re-insurance on existing policies; participating insurance at 4 per cent. Carlisle net premium; non-participating at 5 per cent. Carlisle net premium	34,016,840.82
Reserved for contingent liabilities to Tontine Dividend Fund, over and above a 4 per cent. reserve on existing policies of that class	1,371,482.18
Reserved for premiums paid in advance	16,543.25—$35,876,581.18
Divisible surplus at 4 per cent.	3,120,371.48
	$38,996,952.66

Surplus, estimated by the New York State Standard at 4 1-2 per ct., over $7,000,000.00

From the undivided surplus of 3,120,371.48 the Board of Trustees has declared a Reversionary dividend to participating policies in proportion to their contribution to surplus, available on settlement of next annual premium.

During the year 5,524 policies have been issued, insuring 17,098,173.

Number of Policies in force	Jan. 1, 1876, 44,661.	Amount at risk	1876, $126,132,119.	Death-claims paid	1875, $1,524,815.
	Jan. 1, 1877, 45,421.		1877, 127,718,473.		1876, 1,547,648.
	Jan. 1, 1878, 45,605.		1878, 127,901,887.		1877, 1,638,128.
	Jan. 1, 1879, 45,003.		1879, 125,230,144.		1878, 1,687,676.
	Jan. 1, 1880, 45,705.		1880, 127,417,763.		1879, 1,569,854.

Income from Interest	1875, $1,070,668.	Divisible surplus at 4 per cent.	Jan. 1, 1876, $2,499,654.
	1876, 1,906,960.		Jan. 1, 1877, 2,626,816.
	1877, 1,867,457.		Jan. 1, 1878, 2,664,144.
	1878, 1,948,665.		Jan. 1, 1879, 2,811,436.
	1879, 2,033,650.		Jan. 1, 1880, 3,120,371.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
78 Duane Street, New York.

SATURDAY, MARCH. 13, 1880.

REMOVAL.

On and after May 1st of this year the Rural New-Yorker will occupy its new quarters, No. 34 Park Row, corner of Beekman Street.

Announcement.

We have now as we believe a sufficient quantity of the beautiful Laurel-leaf Willow (Salix pentandra?) to be able to send a few cuttings to all of our yearly subscribers who apply.

We pronounce this one of the most beautiful and desirable ornamental trees (of the second size) in cultivation, extremely hardy and adapted to a great variety of soils and an extensive range of country. Its merits have already been so fully set forth in these columns that further remark is needless. This is a supplementary announcement under our Free Plant and Seed Distribution for 1880. Subscribers desiring cuttings are required to send us a two-cent stamp for postage. We promise to send as many cuttings to each as that amount of postage will cover. When received, place them in an upright or slightly inclined position in mellow soil. Press the soil *firmly* about them and keep it *moist*—not wet. We desire that this beautiful plant should grow in the grounds of every subscriber of the Rural New-Yorker.

Speaking of Hybrids, Professor Beal defines, as we understand him, a variety-hybrid to be the cross between two different varieties of the same species;—a species-hybrid to be the cross between two different species of the same genus; a genus-hybrid to be a cross between two different genera. This, we believe, is according to Sachs. The genus-hybrid is a word that scarcely needs to have an existence. The variety-hybrid is it seems to us, objectionable because "hybrid" conveys a meaning of relationship more distant than that existing between varieties of the same species. It strikes us that "cross" and "hybrid" cover the whole ground, the former to be applied to varieties of the same species that have been interbred;—the latter to be applied to all the more distant relationships.

Several stallions of the celebrated Percheron breed from France, and of the Clydesdale from Scotland, were recently lost on their voyage to the United States owing to the excessively stormy weather, which has prevailed nearly all winter on the Atlantic Ocean.

We have counseled our friends over and over again not to ship full-grown horses or cattle in the winter season, indeed during the five months from the 1st of November to the 1st of April, on account of the liability of dangerous storms during this season, and the great risk of the total loss, or serious injury of their animals. Indeed, it would be much better to never import full-grown horses or cattle. A good judge of them can select colts or calves that are sure to grow up, after importation, equal to their parents. The cost of them is not usually over one-fifth to one-third of those full-grown; the cost of feed and transportation is also much less, and the risk of death or accident trifling in comparison. In six months to two years after the arrival here the males can be put to service, and in another year or two be sufficiently grown to show to full advantage.

BOSI DEVELE NO DROSCHT.

Above is the transcript of a sign that was displayed some years ago in a German grocery in Ohio. We have no doubt the worthy Teuton cudgled his brains severely before the orthography was arranged to suit him; neither do we doubt his mental labor was well repaid in good currency and again in satisfaction. Occasionally a whilom customer might gaze at it in astonishment, shake his head and depart sorrowfully, but such were better lost than retained. Those whose custom was best worth having, congratulated themselves on the fact that their grocer could afford to sell his goods cheaper if he would abide by the rule he had adopted. They saw he could reduce his expenses by saving the wages of an accountant and collector, and would not feel obliged to make them contribute a percentage on all the purchases they made, to make up his losses sustained through the defalcation of careless, dishonest, or unfortunate customers. Another class was benefited also—those who could always pay for their purchases when made, if they must; but who were inclined to spend money in hand for unnecessary things when it was not demanded for the ready payment of necessaries. If this sign were displayed at every store, and its decision final, it would work a needed reformation, and the Philosopher's Stone (on the authority of John Randolph) would be found.

We have "many a time and oft" endeavored to enforce on the readers of the Rural the wisdom of this way of dealing, not we hope without good effect. We carry it out in our dealings with our subscribers, and in all our general business, and hope to see the time, and that at no distant day, when in all transactions less than one hundred dollars at most, the inflexible rule will be that of our German friend, which, spelled according to Webster or Worcester, would read—Positively no trust.

THE INTER-OCEANIC CANAL.

The recent surveys in Central America by M. de Lesseps, with a view to construct a canal that shall unite the Atlantic and Pacific Oceans, are not the first attempt in this direction. Ever since the close of Monroe's Administration in 1825, the United States' Government has frequently had this gigantic scheme under consideration; and European nations were agitated by the same subject, even before that time. Congress has often debated the matter during the past half century; special agents of the Government have been sent out to investigate and survey the several routes; plans have been compared; estimates made; companies organized and the work has been all but begun, when a sudden collapse in the interest has occurred and the matter has again been permitted to rest. Among foreign nations, France has ever been anxious that this project should be carried out, and has entertained a manifest desire that the canal should be built under French auspices and with French capital so that she could control the passage and collect the revenues.

There are three routes by which the canal can be built, namely, across Panama, Nicaragua and the isthmus of Tehuantepec, across southern Mexico. This latter route is much to be preferred for the interests of the United States, as the canal would open directly into the Gulf of Mexico and thus would be almost entirely under the control of our Government, which in time of war might be of untold advantage. When M. de Lesseps undertook the project a few months ago, the event created great excitement among the lobby politicians at Washington; the Monroe Doctrine was taken down from the shelf, where it had long rested in sweet repose, and again rehearsed, commented upon and applied to the present case. Not until the French Government made an official declaration disavowing any connection with the projects of M. de Lesseps, was the excitement abated; but on this assurance the stalwart patriots again leaned back in their easy chairs; the Monroe Doctrine was returned to the shelf, and now the matter seems again at rest.

It should not be allowed to rest here, however. The advantages that may be secured for the commerce of the world, and especially for that of the United States, by the construction of such a canal, are too gigantic and universal to allow of further delay of the work. Of all civilized nations none is more able to carry out the scheme than the United States and none would profit more thereby. We can command both the needed capital and skill. And the American eagle watches the interest with jealous care, unwilling that any other nation should undertake what we are too indolent to commence.

From an agricultural point of view such a canal will prove of great advantage. The guano and nitrate deposits on the coasts of Chili and Peru will be brought nearer to our Eastern farmers by several thousand miles, and can consequently be sold at much cheaper rates. This alone will cause a renovation of Eastern farms and a revival of Eastern agriculture, that may more than pay for the construction of the work. It will enable California and Oregon profitably to discharge their surplus products in European markets, and thus place this fertile portion of our country on an equal footing with the Eastern States.

The passage of the world's commerce through the Gulf will cause an influx of immigrants to the South and revive Southern industries. These must be the inevitable effects in this country whatever nation controls the canal; but it is obvious that if the enterprise is under the protection of our Government, the advantages politically as well as commercially must still be infinitely greater. It is to be hoped that such interests will no longer be trifled with; if American capitalists are unwilling to invest their money in the scheme and our Government still hesitates to take the work in hand, no impediments should be laid in the way of other nations who may wish to do so.

SOME CIRCUMSTANCES WHICH FAVOR THE FORMATION OF SALTPETER IN THE SOIL.

Among the scientific conceptions of recent years few are likely to exert a more important influence upon agriculture than that which attributes the formation of nitrates in the soil and in the compost heap to the presence of a living, *i. e.*, an organized ferment.

This conception not only permits nitrification to be classed with the other processes of fermentation, but enables observers to study and classify the phenomena which characterize the process, and the circumstances which promote it, in a much more satisfactory manner than had been found possible before. The French observers Schloesing and Muntz, who have been studying the subject for several years, have just published a brief paper on "The circumstances that influence the production of nitrates," which is of special interest in that it gives precise definition to several points which were previously more or less obscure.

It is found that, like all other reactions which accompany the development of organized beings, nitrification is accomplished between certain limits of temperature. Below 40 degress (F.) nitrification is extremely feeble, if it does not wholly cease. It becomes clearly appreciable at about 54 degrees, and on increasing the temperature above this point it is found that the amounts of nitrate formed increase rapidly. The maximum action is attained at just below 100 degrees (at 98 degrees or 99 degrees), at which temperature the formation of niter is very abundant. In mixtures kept heated to this point it is possible to observe, in the course of a few days, phenomena which ordinarily require months or even years for their completion. Above 98 degress or 99 degrees the rate of formation of nitrates diminishes rapidly. At 113 degrees it is less than at 59 degrees. At 122 degrees only very small quantities are formed, and above 131 degrees no trace of them can be detected. Under favorable conditions, other things beside temperature being equal, ten times as much niter can be obtained at 99 degrees as at 57 degrees, whence it appears that in the production of nitrates temperature is an agent of very great importance.

As has long been known, ready access of atmospheric air, that is to say, of the oxygen in the air, is an essential condition for the formation of nitrates; and it is a condition which is realized in those localities where niter forms naturally. Indeed, in ordinary soil air circulates freely through the interstices between the particles and through their pores. But in liquids, where the air can only penetrate by a slow process of diffusion, when the liquid is at rest, the amount of niter formed is found to be proportional to the amount of surface which the liquid presents to the air. Hence, when the layer of liquid is somewhat deep, the formation of niter may be increased by agitating the water so that air may be commingled with it.

It has been known also for a long time that a certain amount of moisture is indispensable for nitrification; but Schloesing and Muntz find that dryness is well-nigh fatal. Absolutely dry air generally had the effect of killing the nitric ferment, and in all cases dryness stopped the action of the ferment, as long as the condition of dryness was maintained.

As regards solid substances, it was found that nitrification is the more active in proportion as the substance is more moist; provided, of course, that the substance, earth or what not, is not actually drowned or water-soaked to such a degree that air cannot circulate freely between its particles. When this point is passed nitrification slackens, or it may even stop completely.

In order that niter may form, the materials must be very slightly alkaline. In nature carbonate of lime or, rather, the soluble bicarbonate of lime supplies the needed alkalinity. But extremely weak solutions of the carbonates of potash and soda will answer the same purpose; though when the solutions are made more concentrated than two or three thousandths they have an unfavorable influence and completely stop the action of the nitric ferment. A similar remark applies to carbonate of ammonia and to lime also, the latter fact being in harmony with Boussingault's old observation that the addition of lime to loam is not favorable for the production of nitrates. No advantage was gained on adding small quantities of neutral salts of the alkali—the alkaline-earthy-metals—to the materials in which nitrates were being formed. It is true that materials which already contain nitrates are specially apt for nitrification but this fact doubtless depends upon the presence of the nitric ferment (the nitric yeast, so to say) which accompanied the nitrate in the original liquor. Indeed, the presence of nitrates in earth or other materials is to be taken as an indication that the nitric ferment is there also.

The presence of organic matter, that is to say of some substance containing carbon, is necessary for nitrification, and it is found that a great variety of materials will serve the purpose, such as sugar, glycerine, alcohol, albumen, tartaric acid, etc., as well as vegetable mold,—the so-called humus of the soil. The authors think that the province of this organic matter is to supply carbonaceous food to the ferment, and they have been led to believe that the ferment has a good deal to do with the destruction of organic matter. They find that nitrification occurs equally well in the dark and in feebly lighted places; but in strong light they find that the activity of the process slackens, as Warrington did a few years since. They hold, however, that this retarding influence cannot amount to much in the soil, where only the superficial particles are exposed to direct light.

In experiments upon the spontaneous nitrification of arable land it has been noticed that a period of activity is apt to be succeeded by a term of slackened action. But by tilling or in any way mixing the earth the original activity may be restored, very much as if these operations had brought the ferment into the presence of a new supply of food.

BREVITIES.

Mr. Dun says that fewer middlemen intervene here than in England between the feeder and the butcher.

Week before last we rejected between nine hundred and one thousand dollars' worth of advertising from doubtful establishments.

We do not exactly agree with our respected friend, Mr. J. J. H. Gregory, as to the value of Chufas, having tried them ourselves, though not through several years, or perhaps, with the care he may have given to his crop.

It is a question whether our comparatively low average yield of wheat, 13.7 bushels per acre last year, is not partly due to too thin seeding. In England while 1½ bushels is often enough for fall seeding, if sown early, no wideawake farmer would think of using less than two bushels for spring seeding.

The Rural World says that there is a strong probability that a firm will be organized to open a sorgo sugar factory and works at Edwardsville, Ill., the coming summer. The firm will consist of Mr. G. C. W. Belcher of St. Louis, C. M. Schwarz of Edwardsville, Ill.; and Mr C.F. Miller, the well-known sorgo grower of Minnesota. We wish the new firm success.

Mr. John B. Moore offers a new sort of Asparagus, which he says is "the result of cross-breeding." We have a fancy that there is a good deal of this cross-breeding going on between different asparagus plants while in bloom, and as millions of seeds have been planted and very faint deviations have been known to occur in consequence, we should like to know the peculiarities of Mr. Moore's method.

The New Jersey Solons have repealed the pleuro-pneumonia Act—said repeal to take effect on and after Wednesday March 10, 1880. The quarantine against New York is raised and all cattle will be allowed to enter New Jersey without a permit. Whether the saving obtained by this premature abolition of a wise enactment, will not prove "penny wise and pound foolish" to the State at large and especially to its cattle interests, we have grave doubts.

Mr. M. Z. Bingham of Princeville, Ill., who was a prize winner in the contest for the greatest yields of Blount's Prolific Corn, sends the following acknowledgement of receipt of premium:

Princeville, Peoria Co., Ill., Feb. 21st, 1880.
Editors Rural New-Yorker:—I received today from Rumsey & Co., Seneca Falls, N. Y., $25.00 worth of their goods, all sound. With many thanks to you and them for the 6th Corn Premium, I am, Yours truely,
M. Z. Bingham.

Industrial Topics.

THE POSITION OF AGRICULTURE IN ENGLAND.

PROFESSOR I. P. SHELDON.

There can hardly be any doubt that American farmers are in a mood to sympathize with their brethren in misfortune on this side of the Atlantic. They are so on the ground of suffering in common with them, I assume. The farmers on your side and on this are companions in misfortune, and even in misfortune companionship has the faculty of making people somewhat less discontented with their lot than they would be without it. It makes an empty pocket, as well as an empty heart, feel a little less desolate to know that it is "neighbors' fare" all round; less desolate, that is, because less lonely, than it would be if such were not the case. Thus are we gregarious in feeling as well as in habit.

After this bit of philosophy, which is merely the expression of a principle in which many poor souls have been fain to find what scanty comfort it afforded them, I may venture to say that the worst is over, so far as cause is concerned, and that while the suffering has been sharper here than on your side, the effects will probably be seen the longer. Your farmers, too, have suffered from low prices, and many of them from a deficient production, but in addition to these things we have had the most mercilessly forsaken seasons that can be imagined, and I doubt whether those among you who have lived always in the American climate can realize in its depth of dreariness what such a season is like as the one we had last year in England. That you know what rain is I am well aware, for I have seen it rain in the States at a rate with which our climate can but now and again compete, but you do not know what it is to have scarcely a day without it from the middle of April to the middle of October, with the thermometer ranging all the while between 55° to 70° in what ought to have been the summer months, and to have such a season preceded by such a winter of alternate snow and rain and frost as only the English climate can pretend to produce with success.

I believe I am safe in saying you never saw anything like it; and I may venture to hope we shall never see its like again, otherwise I shudder to think what the consequences would be. Last summer and autumn were, it is true—so far, that is, as we have at present gone—the last of a disastrous sequence of wet seasons, but they were far worse than any that had gone before. It is to be hoped that last year, which was the wettest of the series, may prove to have been typified by its own last day, which was the wettest of the year; if it does prove so, then the series is over and the sun will shine once more and "the cat will sit in the window again."

Up to the beginning of the last quarter of the year prices of almost every kind of agricultural produce were steadily declining; cheese and butter, particularly, were lower than they had been for many years, and wool reached a point which the present generation know nothing of except from tradition. Store stock of all kinds went steadily downward in value, so that a farmer's capital, as represented by his flocks and herds, was much less at the end than it was at the beginning of the year. Beef and mutton fell to prices which left no profit on the summer's grazing, and horses were barely salable. And to make matters still worse, all kinds of stock, except where much grain had been fed to them, grew very slowly and there was a general want of condition all round. This was to be expected from such a summer and autumn—the animals were seldom dry and never as warm as they ought to be to do well. The hay and grain harvests alike were miserable failures; the quality of forage and grain alike, owing to the lack of sun and warmth, was very inferior and they were harvested in bad condition all over the country.

Perhaps the worst feature in that disastrous year was the prevalence of liver-rot amongst sheep, which the continued rain did so much to promote. Sheep rotted last summer on land to which tradition did not ascribe any liability to that terrible parasitic scourge. The losses among sheep from this cause are probably larger than they ever were before in these islands. Many farms have not a sheep left, and some parishes are almost wholly destitute of them. And still they are dying by thousands, or are being slaughtered "to save their lives." In the markets they are selling at less than half the ordinary prices, and in some districts they cannot be turned into money at all. In some districts, however, the sheep remain sound, but this is the case only on sound soils, as the carboniferous lime-stone and sand-stone formations. The price of wool is kept down by the large influx into the markets of skin-wool from the dead sheep, and mutton is low in price because of the compulsory slaughter of many sheep that would have been kept on but for their unsoundness. When all of the unsound sheep are got rid of, the sound ones are sure to be very dear—dearer, in all probability than they have been for many years.

Cheese began to rise rapidly in price some five or six months ago, and it is now very dear; but this is owing to the small make of the season. It is now probably as dear as it has been any time during the past 20 years, and this is making some amends to the farmers who have been able to keep what they made; yet very much was sold whilst prices were still very low. Butter, too, commands a very satisfactory price and dairy produce promises to be dear for some months to come. The milk trade has been the only branch of farming that has escaped serious loss, and were it not for this the position of English dairy farmers would be almost as bad as that of any others.

Great numbers of farmers are insolvent, and many more are giving up the business in order to save the remnant of their capital. Farms to let are advertised by hundreds, and rents are falling rapidly; many farms, in fact, particularly heavy-land, arable farms, do not find tenants at any price, and the land-owners have to farm them as best they can. Sound grass-land farms, however, have depreciated very little, if any, in value, though for the time being landlords are making remissions of rent to tide over the present crisis, after which it is hoped things will mend again. You have heard from the political agitator, Mr. Parnell, how distressed Irish farmers are in some parts of the country, and no doubt there is a good deal of truth in what he is telling you, but it is probable that numbers of English farmers are in quite as bad a plight as the Irish, though they do not take the same way to make their hardships known.

I have said that the worst is over, so far as cause is concerned; that is, prices of most things have improved and are likely to improve still more, before long. But the effects of the disastrous period through which we have passed will continue to disclose themselves for some time to come. Numbers of farmers have held on "tooth and nail" through the bad times, and now that there is a prospect of times mending they find themselves exhausted in purse and in spirit. Had they only a bit of fresh capital now to go on with, there is a chance they might win back some of what they have lost; but as this fresh capital is not forthcoming they have to founder just in sight of harbor. Those farmers, on the other hand, who had laid by something against a rainy day and can now in consequence go on without feeling themselves seriously crippled, will in all probability soon find themselves in a fair way to make money again.

It is, however, probable that, although we may get good weather this year, the dripping rains of last year will be found to have so impoverished the land that crops will not be abundant. The more soluble elements of fertilization, it is to be feared, have been washed out of the soil leaving it so much the poorer. The dry summers we had in 1868 and 1870 did much harm to some of the thin-skinned land in the country, but I believe the rain of 1879 will be found to have done still more harm to a wider variety of soils. It is not possible to correctly estimate the loss the nation suffered through last season's influence, but I doubt very much if it be any less than one-fourth of our National Debt. I would venture to estimate our loss at $1,000,000,000. Meanwhile it is probable that good will come out of the present evil, for our farmers will have greater liberty to farm in the most profitable manner, and Parliament is disposed to remove some of the burdens which press unjustly on the agricultural interest and on the land.

Sheen, Ashbourne, Eng., Feb. 10, 1880.

Hygienic Information.

COMMON POISONS AND HANDY ANTIDOTES.

Compiled for the readers of the RURAL NEW-YORKER by DR. A. R. LEDOUX.

In these days when there is so much accidental and not a little intentional poisoning, our readers will do well to preserve the following list of chemical poisons and the most readily obtainable antidotes. Many of the substances included in the list are harmless in small doses, but prove violent poisons when taken in large quantities.

1. Poisons—Sulphuric acid ("oil of vitriol"), and nitric acid ("aquafortis"). (A.)

Antidotes—Magnesia, soda, chalk, whiting, soap-suds, or plaster from walls.

Treatment of patient—Give *milk*, eggs, oils, or flaxseed tea. (A.)

2. Poisons—Muriatic acid.

Antidotes—Same as in 1, except chalk, plaster from walls, and whiting, which must *not* be given.

Treatment—Same as in 1. (A.)

3. Poisons—Oxalic acid ("salt of lemons"), potash binoxilate ("salts of sorrel").

Antidotes—Magnesia, chalk, plaster from walls. *No soda or soap-suds.*

Treatment—Give an emetic. (Twenty grains of zinc sulphate, if procurable, is best.) (A.)

4. Poisons—Acetic acid (strong vinegar), tartaric acid.

Antidotes—Magnesia or soda mixed with water.

Treatment—Same as in 1.

5. Poisons—Soda, potash (lye), ammonia.

Antidotes—Vinegar and water, lemon juice, orange juice, or lime juice.

Treatment—Give oils, or the substances mentioned in 1.

6. Poisons—Saltpeter, cream-of-tartar, sulphate of potash.

Antidotes—None known.

Treatment—Emetics, ice internally and hot fomentation on the bowels, milk, or barley-tea.

7. Poisons—Nitrate of silver ("lunar caustic").

Antidotes—Common salt, brine, or sea-water.

Treatment—Emetics, *after* giving the antidotes.

8. Poisons—Arsenic, Paris-green.

Antidotes—Charcoal powdered, magnesia, oil, and lime-water. Hydrated oxide of iron is the best antidote, and is made instantly by adding ammonia to tincture of iron (muriate).

Treatment—Emetics, white of eggs, milk; afterwards a good dose of castor oil.

9. Poisons—Mercury salts, corrosive sublimate.

Antidotes—Raw eggs (both yolk and white), milk, flour and water, iron filings in mucilage.

Treatment—Emetics, rice water, starch paste, afterwards opiates.

10. Poisons—Lead acetate ("sugar of lead"), ("fly poison").

Antidotes—Epsom salts, Glauber's salts, alum, white of eggs.

Treatment—Emetics, purgatives, milk.

11. Poisons—Copper sulphate ("blue stone").

Antidotes—White of eggs, sugar, iron filings.

Treatment—Emetics. (See Note B.)

12. Poisons—Alcohol.

Antidotes—*Dilute* ammonia water.

Treatment—Emetics, salt water, warm mustard water, cold bath.

13. Poisons—Coal gas.

Antidotes—Fresh air.

Treatment—Bleeding.(?)

14. Phosphorus (rat poison), matches.

Antidotes—None.

Treatment—Emetics, slippery-elm tea or barley tea, *but no oils.*

15. Poisons—Henbane, bitter-sweet, deadly nightshade.

Antidotes—Strong tea, charcoal powdered, effusion of oak bark.

Treatment—Emetics, followed by castor oil.

16. Poisons—Strychnine.

Antidotes—Charcoal, chloral hydrate.

Treatment—Emetics, tobacco juice applied to pit of stomach (for few moments only), warm injections.

17. Poisons—Prussic acid, laurel water, peach oil, oil of bitter almonds.

Antidotes—Magnesia, iron rust, ammonia (inhaled cautiously).

Treatment—Stomach pump, emetics, application of cold water and friction, brandy and strong coffee.

18. Poisons—Tobacco.

Antidotes—Tea, effusion of oak bark.

Treatment—Emetics, purgatives.

19. Poisons—Camphor.

Antidotes—None.

Treatment—Emetics, opium (laudanum).

20. Poisons—Poison oak, sumach.

Antidotes—Weak ammonia water.

Treatment—Emetics, milk, oils.

NOTES.

(A.) For nos. 1, 2 and 3—the stomach pump *must not* be used.

(B.) The poison itself will often produce violent vomiting. In all such cases emetics may be omitted in the treatment.

Common emetics are a table-spoonful of salt in water, a teaspoonful of mustard in water, 20 grains zinc sulphate, 5 10 grains copper sulphate.

In all cases of suspected poisoning send for a physician at once. Use the greatest caution in administering any but the simplest remedies without medical advice.*

* I have made free use of Taylor's, Kallmyer's, and other works in preparing these notes.

Various.

BRIEFLETS.

We do hope our writers will never again favor us with articles upon the subject—"*Does Farming Pay?*" . . The Australians seem confident in the success of exporting meat in in a fresh, uncooked state to England on the American plan. . . There are no longer any cases of foot-and-mouth disease in England. "It has taken," says the London Farmer, "only just one year to rid the country of the most disastrous foreign disease that ever harassed it." . . Mr. Finlay Dun tells Englishmen that the yield of wheat throughout the United States averages about one-half of what is considered the British average, viz., 28 bushels. It oscillates between 13 and 14 bushels. Better cultivation and more care in the selection of seed suitable for the locality, might considerably raise this very moderate average; but drought at some period or another of the summer must always shrink the American yield, and it will probably always take two acres to produce the amount of wheat which the British farmer gets or should get from one. . . Mr. Dun says that the cord-binder is destined to supersede the wire binder. . . Colman's Rural World says: "We know of no one who raised cane last year that is not going to raise it in increased quantity this. And for every one who raised it last year there will be twenty more this year." . . Success to the sorgo industry! . . It is quite as unnatural to deprive ruminating animals of vegetable food as to deprive man of it. . . Take a plate and place thereon two lumps of butter—the one with a natural June color and the other white as lard. Nine persons out of ten, says J. T. Ellsworth, would choose the colored lump. . . When the substance used to color butter is as harmless as the salt which flavors it, there is no harm done. . . The prevalence of rot in sheep in Great Britain amounts to a national calamity. . . We should judge that some of the Cow Peas would make excellent pickles. What says Mrs. Maple? . . . Many still believe in sowing oats with grass seeds upon the lawn. "The oats shade the grass." But the grass *needs* no shade. It needs moisture, and this is the very thing the growing oats take away from the grass. . . An agricultural paper in Canada offers a prize of five dollars for the best essay on "Instructions to New Settlers in Manitoba." The N. Y. Sun competes for this prize. Its essay is as follows: "Don't go. Look at the figures—50 and 75 degrees below zero" . . A cat in the back yard, just ready to pounce on a chicken, is a sign of spring. . . Pres. Barry thinks the English sparrow beneficial to us. He asks: "Does any one *know* that it eats fruit-buds?" *We know* that it eats ripe strawberries. . . Weeds stick in the farmer's crop. . . As Dr. Gregory points out, beauty on our farms, as exemplified in handsome shade trees and shrubs, is a marketable quality. One hundred dollars' worth of suitable hardy plants judiciously planted—the RURAL NEW-YORKER thinks—will add not less than $1,000 to its value in five years. If farmers could be brought to believe this, the nursery business would have no occasion to complain of hard times the coming spring. . . Cut cions for grafting later. . . Budding from such cions may be done in the spring as well as in summer. It is only necessary to keep the buds fresh and dormant. . . Better a hot enemy than a lukewarm friend. . . Mr. H. B. Ellwanger says: "We have probably produced as many of the leading and best varieties of fruits as all other countries combined." . . Sow onion seeds as soon as possible. Five pounds of good seed per acre should be drilled in in rows fifteen inches apart. Everybody knows that success in onion culture depends in a great measure upon *thorough weeding.* For the rest, let the land be *rich* and *well drained.* . . Danvers Yellow is a good keeper and a profitable market sort—round and of mild flavor. Red Wethersfield is a great sort to yield—hardy, vigorous, and marketable. White Globe is a good kind for both the North and South. . . If our readers would have a long season of tender green peas, sow them all early; that is, sow the early, the intermediate, and the late at the same time and as soon in the spring as the ground warrants. Late peas—*sown late*—are not worth the ground they occupy. . . Is there anything, asks Mr. Meehan, that costs so little as flowers and trees, that makes life so much of a pleasure? . .

A RECORD OF HEALTHY GROWTH.—The thirty-fifth annual report of the New York Life Insurance Company, as it is hardly necessary to say, is a very strong financial document which will be examined with keen interest and general satisfaction; were it otherwise, the fact would be extraordinary and discouraging, considering the company's great age and high reputation. The statement now made public is such as might be expected from such an institution. Premium income shows an increase of over $300,000 as compared with 1878; interest receipts also show a considerable increase; assets increase nearly three millions; business done exceeds that of 1878 by more than a million; the volume of outstanding insurance rises over two millions; surplus shows a large increase; the number of policies in force is larger than ever before; the mortality experienced is less than in 1878; and in every particular the report is a record of healthy growth. It was not until 1878 that the New York Life failed to make some annual progress in respect to the volume of its outstanding business, and in that year every company in the State fell back somewhat; but 1878 was the year of utmost depression, and the recovery has begun in life insurance as in everything else. Whatever advantages of absolute security, the lightest actual cost, and the most equitable dealing it is possible to offer are combined in this admirable and mutual company, and those are fortunate who hold its impregnable policies.

Literary Miscellany.

ALICE CARY'S SWEETEST POEM.

Of all the beautiful pictures
That hang on Memory's wall,
Is one of a dim old forest,
That seemeth best of all;
Not for its gnarled oaks olden,
Dark with the mistletoe;
Not for the violets golden
That sprinkle the vale below;
Not for the milk-white lilies
That lean from the fragrant hedge
Coquetting all day with the sunbeams,
And stealing their golden edge;
Not for the vines on the upland
Where the bright red berries rest;
Not the pinks, nor the pale sweet cowslip,
It seemeth to me the best.

I once had a little brother,
With eyes that were dark and deep,—
In the lap of that olden forest
He lieth in peace asleep;
Light as the down of the thistle,
Free as the winds that blow,
We roved there the beautiful summers
The summers of long ago;
But his feet on the hills grew weary,
And one of the autumn eves
I made for my little brother
A bed of the yellow leaves.

Sweetly his pale arms folded
My neck in a meek embrace,
As the light of immortal beauty
Silently covered his face;
And when the arrows of sunset
Lodged in the tree-tops bright
He fell, in his saint-like beauty,
Asleep by the gates of light.
Therefore, of all the pictures
That hang on Memory's wall,
The one of the dim old forest
Seemeth best of all.

FOUR OLD MAIDS.

W. V. A.

(Continued from page 158.)

"Mrs. Lansing has invited us to take lunch with her. Have you any objection to remaining?" said Frederica, quite loudly in Melissa's ear.

Melissa drew herself up and said very coldly, "Mrs. Lansing must excuse me; punch is something I never indulge in."

"O, horrible!" half shrieked Arabella; and rushing to Melissa, she shrieked into her ear, "It is lunch, lunch!"

"O!" said Melissa. "I beg your pardon; you are very kind and I shall be pleased to remain."

And so they remained and were introduced to the guests, and afterwards, when they went out to their carriage, the four young gentlemen that I have told you of very gallantly escorted them.

There was a great deal of merriment among the Lansing's and their guests for the rest of that day, but they would have been greatly astonished could they have looked into the residence of the Misses Skidmore and seen four young ladies of their acquaintance at times almost shrieking with laughter.

There is no telling how it would have ended had not Faras and Lansing simultaneously burst into a loud laugh, which was followed by a profound silence that was suddenly broken by the four ladies rushing from the room at a most undignified pace, while the gentlemen silently retraced their footsteps out to the road, where Rob Lansing exclaimed, "By George! It couldn't be beat!" This was the commencement of the merriment which lasted for hours at the expense of the "Clan."

The Misses Skidmore reached the sitting-room on the upper floor in a body and closed and locked the door, but not a word nor a smile passed their lips until the last echo of the retiring footsteps was heard, when Margaret said, "Oh, that moustache!" and burst into an uncontrollable fit of laughter, in which all joined but Blanche, who walked to a mirror and silently surveyed herself and then commenced to cry, but this only caused the rest to laugh the more till presently she said spitefully, "Well, I guess it wasn't any worse than that liddle!"

"O, O!" shrieked Margaret and Rose, holding their sides and laughing until the tears rolled down their cheeks.

In vain did Blanche and Olive remind them of the part they had taken, but they could only see the ridiculous side of the affair, and so contagious was their merriment that the other two were soon laughing as loudly as they.

The next day was beautiful and the Lansing party were off on their excursion bright and early while the ten o'clock train from M—— carried the Misses Skidmore some fifty miles away to a quiet little village where they remained until the Lansing party had been home for a couple of weeks, when they reluctantly returned home also.

They had not been home twenty-four hours when Faras called on Olive. She begged to be excused, but he insisted upon seeing her, so she went down to the parlor and received him with great dignity of manner but a flushed face. He was perfectly self-possessed and chatted away as though he had not seen her for several weeks. He spoke of the pleasant time he had had at the Lansings, but not a word of the Misses Skidmore. All this threw her off her guard completely, and presently when he saw she was least expecting anything of the kind he drew his chair close beside her and, looking her gravely in the face, he said, "Olive, why do you not wear my ring? I was thoroughly in earnest when I told you that I loved you and wanted you to be my wife."

It was so sudden that she could only stare at him in a dazed way, and taking advantage of it he slipped his arm around her and drawing her close to him imprinted a kiss on her lips.

She sprang to her feet and pushing him violently from her, exclaimed angrily, "How dare you' sir?"

He had risen when she did, and now stood before her. "I think a man may kiss his affianced wife, and you know it is not the first time this summer that I have kissed you."

"Allow me, sir, to congratulate you for having acted a most contemptible part, for which I scorn you!" and making him a deep courtesy, she turned and would have left the room had he not caught her by both hands and exclaimed; "Oh! Olive, don't!"

She looked up at him, her face ablaze with anger, but something she saw in his face caused the anger to die out and her head to droop.

"Olive, darling," said Faras, "won't you keep your promise and put my ring on again?"

"Yes!" came the reply so faintly that none but a lover could have heard it.

There is no need to tell any of the "foolish" things they said and did during the next hour, at the end of which Olive went up stairs and got the ring which Faras then put on her finger for the second time.

The next evening Enders, Lansing and Stedman called at Mr. Sheldon's and were received by the three young ladies with many blushes and shy quizzical looks. They had been there but a short time when Faras and Olive called.

This was a plot on the part of the gentlemen to have some fun at the expense of the ladies, and I am ashamed to say, Olive knew all about it, but did not warn the other girls.

It was soon evident to the three girls how matters stood between Faras and Olive, and great was their wonderment as to how it came about.

Later in the evening Faras asked Rose for some music, and going to the piano she asked him what she should play, to which he replied by naming the negro melody she had played on that memorable night.

"O, yes" said Enders, "do play that, Miss Rose, and Margaret, you dance it for us."

"And I am sure Miss Blanche will sing it for us!" said Stedman.

"Can't you find a violin, Miss Olive?" said Lansing mischievously.

The faces of the three girls were studies during this dialogue, and they looked as though undecided as to whether to laugh or cry, but Margaret decided it by a laugh in which all joined but Blanche who suddenly rose and walked into the library, which had the effect of silencing Stedman who soon followed her, and Blanche who was passionately sobbing was startled by a pair of strong arms around her and a well-known voice whispering in her ear, "Don't cry, darling, I didn't love you any the less as Miss Frederica."

There is no telling what passed between them during the next half hour, but when they again entered the parlor it was with such radiant faces that Rob Lansing laughingly compared them to the sun and moon.

Never did eight young people spend a more delightful evening, and when they rose to depart Rob Lansing said, "Say, boys, let a fellow congratulate you, won't you? and seizing Faras's hand he shook it violently, repeating the operation with Stedman and Enders.

Well, Rob, shall we not congratulate you and Miss Rose also? said Faras.

Lansing turned to Rose who a moment before was standing at his side but who was now making a hasty exit from the room, and springing after her he said, "I'll tell you when I come back." And when he came back a few minutes later leading Rose whose face was suffused with blushes he said. "All right, Faras, wish me joy!"

"Come now, Mr. Enders," said Olive, "how did you and Margaret manage it so quietly? I am quite sure you have not been out of the room tonight and you did not engage yourself to Miss Melissa, did you?"

"No, I did not" said Hugh, but I became engaged to Miss Dean last spring."

"O, you sly thing?" said Olive to Margaret; "and you never told the clan!"

During the winter at a masquerade party the Misses Lansing and all who were visiting at the Lansings' during the summer were surprised to see the Misses Skidmore and still more so when their goggles and wigs were removed, to discover who they really were.

THE EYE-OPENER.

Wildes & Co., of Boston, offer a $9 new American Dictionary for 27 cents. Now any man—or even baby—with a particle of gumption, must know that such an offer is "meant to deceive." W. & Co., advertise widely at great expense; they have other expenses too in carrying on their affairs, and the object of all this is to make money, and how in the name of common sense can they do it by giving $9 worth for 27 cents—and that only to pay postage on their munificent gift! Of course its a deception but so gross that really it should not require exposure....There are several mining companies which are advertising widely throughout the country by circulars and in newspapers, offering fine chances, or even certainties, of large returns for small outlays. These may all be set down as untrustworthy. Capitalists are ever ready with money to invest in genuine mines, and "wild cat" concerns are losing speculations on any terms—witness the Bullion Mining Co.; the Gold and Silver Mining Co., and others—pure swindles—all of which did business in much the same way as that now advertised by a Mining Company, whose "promising" advertisement is before us and whose headquarters are in the "Hub." Nellie McKee, who some time back opened a Branch of the Chicago Board of Trade at Cincinnati, has absconded leaving a pile of debts behind time. The Eye-Opener, some weeks ago, spoke about this Chicago Board of Trade, and the warning then given, of course, applied to its legitimate and illegitimate offsprings.

A SCHOOL-BOY got up and read a composition on "The Tree." He got as far as "This subject has many branches," when the teacher said, "Stop! you have not made your bough yet." If you interrupt me again," said the boy, "I'll leave." "You give me any more impudence, and I'll take the sap out of you. Do you understand?" said the teacher. "I twig," said the boy, and then the regular order of business proceeded.—Des Moines Register.

For Women.

CONDUCTED BY MISS RAY CLARK.

HINTS ABOUT FLOWERS IN WINTER.

A. M. THORNTON.

When Charlie and I were married we moved into the old-fashioned house that had been the Thornton homestead for years. The house was full of closets, cupboards and those tuck-away places dear to a woman's heart; but there was no place to put my flowers, of which I had a fine collection.

On the south side of the sitting room was the nicest spot for a bay-window, but I didn't like to ask Charlie to build one, as we spent a great deal of money on stock and out-buildings. But that bay-window did rankle on my imagination. I dreamed of it day by day and night by night. The Good Book says, "Out of the abundance of the heart the mouth speaketh;" so one day when Charlie asked me what I'd have from the store, I asked him to get me "ten pounds of bay-window." "A word to the wise is sufficient;" the very next day Charlie, like the dear, good soul he is, began the window. It was a dull time for carpenters, and he found one that would work cheap, and with what work he did himself the window cost a little less than $20. To be sure Mrs. Pry, my neighbor, informed everybody that "young Thornton's wife would ruin him next. He'd had to build a bay-window for her, no telling how much it cost. That comes of marrying a stuck-up school-teacher, instead of a smart farmer's daughter, like my Jane." But, Mrs. Pry aside, the window was a success.

I only keep those plants that long experience has taught me will reward my care with plenty of flowers, together with a few whose leaves are as beautiful as the posies themselves. For soil I use good garden soil and compost from an old cow stable, together with an admixture of sand. A few pieces of broken stone in the bottom of the pot secure perfect drainage. For the Calla, the black swamp muck comes very near to its natural soil, but two parts of compost and one part of garden loam will do. Geraniums, Roses, Fuchsias, Heliotropes, Lantanas and Carnations, the same; Primroses and Salvias need two parts of garden soil to one of compost. Scented Geraniums should have a larger pot than the flowering kinds, to encourage a ranker growth. Lantanas, Heliotropes, Begonias and flowering Geraniums need six-inch pots. Fuchsias, Eupatoriums, Roses and Coleuses require the seven-inch size. Abutilons, Callas, Cacti, Carnations, Ageratums, Begonias, Catalonians, Jessamine, Lantanas, Libonia, Wax Pinks, Mimulus, Oleanders, Petunias, Primroses, Roses, Salvias, Stevias, Verbenas and Violets, never fail to do well with me. I am shy of novelties and cling to old friends in spite of the enticing words, "very magnificent" and "grandiflorus," as Charlie often calls it.

For vines, the English Ivy stands first, it is so obliging it never pouts at standing in the corner or in any out-of-the-way place, but grows away as if content with its lot. Maurandias, with their white pink and violet flowers, are beauties. I sowed the seed of mine in the early spring, transplanted five roots into a six-inch pot (they don't take much room) and placed it on the verandah in the summer. Here it grew about six feet in length and was covered with blossoms; in September it began to die down. I then cut it down to the roots, repotted, watered and set it away in a dark place for a few days, until it commenced growing again. There are now yards of it with its tiny, ivy-like leaves clinging to everything with its running tendrils. The new German Ivy, Senecio macroglossis, is a beauty; the ribs and veins to the leaves are of a lighter color than the leaves themselves, while the plant is as strong as the common German Ivy. The Cissus discolor is a lovely vine with leaves shaded with dark green, white and purple, while the upper part of the leaf has a velvety look, but it needs to live on the top of the stove so I had to give it up. Tropæolum, Hoyas, Tradescantia, Madarias, Thunbergias, Ice-Plants, Kenilworth Ivy, Lobelia, Cobæa and Loptospermum, all are vines that do well with me. Vines need more water than plants and are particularly grateful for a sprinkling of warm water over their bright leaves. The Cobæa is a rapid grower but the flowers are rather coarse. It has always troubled me to raise Smilax; it would grow furiously, then suddenly, before I realized what was coming, it became afflicted with "jaundice" and faded away. This year I left it without care all summer, putting the pot in the shade and not watering it at all. In September I watered it again and now it has yards and yards of lace-like green. Rest in summer and moisture in winter seem to be what it needs.

The Chinese Primrose is one of my favorite plants. The single kind blooms much better than the double. The single is the most cheerful little thing; always full of flowers, and only asks not to be kept too wet. I bought the seed in the spring, planted them in a mixture of good garden soil and a little sand. On these I placed my seeds, pressed on lightly, watered with warm water, and set in a warm place. The tiny plants were transplanted when large enough, and placed during the summer in a shaded place. In the winter they are ready to blossom like the Rose. Carnations need rich earth and water. The best Carnations for winter blooming are President DeGraw, white, La Purite, carmine, La Purite, variegated; Edwardii, white, Mrs. Wilson, scarlet; Glory of Venice, orange and rose-color.

Geraniums should have good soil, plenty of sun, and a moderate supply of water. The salmon Geranium is a profuse bloomer, often budding when a tiny slip, and sending up stalk after stalk of flower until perfectly exhausted. The best kinds are General Grant, Harry King, Peabody, Sir John Moore, Haidee, Dr. Kock, all red; Bicolor, salmon; Master Christine, deep pink; and Snowflake, white.

Among Roses, the Bella, white; Sofrano, yellow; Bon Silene, carmine; Isabella Sprunt, sulphur; Duchesse de Brabant, pink; and Mad. Margottin, yellow and rose-color, are the best for winter. The green louse, red spider and scale bug, are very fond of the tender rose shoots, eternal vigilance alone, will save the plant from its enemies.

Let your Roses remain in pots all summer, sinking them in the ground in some shady spot. Take up and repot in September; give them a good pruning, and set for some days in a cool place. In this way I manage to have plants full of scented blooms all winter. My Calla is given a rest during the warm weather; the pot is tipped on the side, under the shade of some tree, and water is withheld for two months. The roots are then washed, and it repotted in rich muck, and set in the shade. After starting, I give it the sun again, and plenty of warm water. In winter, I give plenty of hot manure coffee, and wash its leaves every day. It frequently buds before I can get it into the house.

Abutilons, or Chinese Bell-Flowers, need sun, water, and room. The white Boule de Neige is pretty. A. vexillarium is of a climbing habit, with pretty tassel-like flowers.

Lantanas have striped crimson and yellow flowers. They are easily grown and always ready to blossom. The yellow or orange shade is my favorite. My plant last summer was immense, and such a wealth of flowers! Among Begonias, jasminoides, Saundersonii and nitida alba do nicely. Fuchsias need rich soil, Speciosa and Lustre, being the only ones that bloom during the winter. The Oxalis, too, is a constant bloomer—you can't have too many.

For the insects that infest plants, I find that the frequent sprinkling kills the red spider, smoking with tobacco, and hand-picking is the best for green lice, and the scale bugs, I pick off too. Give your plants fresh air whenever possible, and every day give them a bath. I take warm water, drop in a few drops of aqua-ammonia, which makes it like rain, and sprinkle my plants with a whisk broom. How they laugh and shake their leaves at me in a grateful, but silent way! Don't sprinkle Chinese Primroses. I give my plants manure "coffee," made by soaking cow manure in hot water (I use an old keg) until of the color of weak coffee. This is particularly grateful to Oleanders and Callas. Vines and hanging baskets should be well soaked. I have the top of the bay window full of hanging baskets—old tin pails, worn-out basins, tin cans, anything I could get hold of. These are given a coat of paint, filled with earth and planted with vines. The plants are all full of blossoms, and I have picked many bouquets. Some have cheered the sick, some have lain on the cold pulseless breast of loved ones, and some have decked the bride on her wedding day. Mrs. Pry from her window, shakes her head, and mutters "some folks must have bay-windows, and other flummididdles, to gratify their pride," but what care I? My flowers smile on me, and whisper

"The hand of God hath made it, and where'er
The floweret blooms, there God is present also."

MORNING CALLS.

When paying a morning call, a lady or gentleman must not give her or his card to the servant when the mistress of the house is at home. Such a proceeding would be contrary to present usage, and in the event of a caller making such a mistake, a well-bred domestic would suppress the card, and simply announce the name on entering the drawing-room.

In olden times the contrary custom was observed. The visitor produced his card, which was carried on a silver salver into the drawing-room. Such a proceeding would often be agreeable and convenient in many respects, and is likely enough to come again into fashion.

If the call is of a purely business character, and the visitor unacquainted with the lady of the house, it is still proper to send in a card with the inquiry whether the lady is engaged. Or in the case of a lady making a personal call upon another lady (a stranger) respecting the character of a domestic servant, for instance, a card should be sent in; it would be, however, in better taste to write first, asking for an appointment. If this is done, a card is not delivered.

If a lady is dressing to go out when a visitor calls, the servant can mention that fact to a visitor calling, and offer to ascertain if the mistress will see the caller, and the caller would use her own discretion as to whether she will allow him to do so or not; but unless the visit is one of importance, it would be best in such a case only to leave cards.

FASHION NOTES.

All white toilets are worn, not only at balls, but to grand dinners and evening receptions, when there is no dancing. White is becoming to all young looking faces.

Sleeves are made quite tight and rather short; in some of the latest models introduced, they are trimmed about the elbow instead of around the wrists.

Feather turbans grow in popularity. Peacock blue is the favorite shade, though some gray ones, made of owl's feathers, are very elegant.

Handkerchiefs finished on the edge with inch and a half borders of foulard silks in fancy grounds, with little bouquets of several colors, are made into pretty breakfast caps.

Medium and dark shades of kid gloves are more worn for full dress than for many seasons past.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN-THOUGHTS FROM EVERY-DAY HOUSE.

MRS. ANNIE L. JACK.

ONE of the members of our family has a great horror of hash, always qualifying the dislike with the added phrase "except at home." I improved a dish the other day that was well received, and the hash-hater especially seemed to appreciate it. As a good method for using up cold mutton or beef it is really excellent. Take any bones there may be in the meat; put them in the stew kettle, over-night, with a head of celery, and an onion stuffed with cloves with water to cover it. In the morning, when required for use, strain off the liquor. Then cut your meat fine as for hash, add pepper and salt to taste, and two ounces of onion to every pound. Place in a deep dish a layer of mashed potatoes, a layer of the meat and another of potatoes. Pour over it your gravy; cover and bake for an hour in a moderate oven; take off the cover a few minutes before serving, in order to give it a "handsome brown." Serve in the dish in which it is baked.

Speaking of celery reminds me that this vegetable ought to be at hand in every farmer's cellar; but if it is not procurable, it has been proved that old unsalable celery seed imparts flavor to soups—and can be bought very cheap of seedsmen. A few days ago we prepared too much at once for the table, and found it could be kept for several days by rolling in a clean, damp cloth and putting in a dark cool place. When once more placed in water for a while, it became as crisp and cold as ever. I think, apart from any medicinal virtues ascribed to it, there is nothing in mid-winter that so brightens a table, and whets the appetite as the green and yellow, crisp, nutty stalks of this only half-appreciated vegetable.

LOG CABIN SKETCHES; OR JESSIE SEABRIGHT'S DIARY, NO. 10.

MAY MAPLE.

OCT. 10, 18—The forests have put on their royal purple, crimson, russet and gold. I feel like going into enthusiastic raptures over the natural beauty of these grand old woods; the dim old aisles are carpeted with the gayest matted-green mosses, intermingled with scarlet berries and autumn leaves. And Bertie and I have gathered a host of these leaves to ornament our cosy cabin the coming winter. I have made some handsome rugs; one to put down in front of the stove, and another by the lounge. These are made by drawing rags through coarse coffee sacking with a large hook; a drab or brown background and a central figure of Roses and buds, or a bunch of Pansies, make a cheerful combination most pleasing to the eye. These rugs were much admired at our county fair and drew first premiums. I used cotton rags for all but the central figures; and for these I used old bright flannels, bits of fancy delaines and merinos. In front of Bertie's crib up-stairs, is a rug made of old, worn-out stockings, that is really pretty and so warm and soft to his little feet, while he is dressing; the stockings are cut lengthwise, in strips about half a finger wide. These strips were basted on to a piece of bagging, "shingle-fashion" and then raveled at one edge, making a long mossy fringe of loops. The most of the old socks were a gray mixture, but Bertie's were of a bright red, blue and white, and there was enough of these to mix in, to break up the monotony that one color would have presented. Not a bit of the heading shows, and the edge is neatly faced with cloth. It is really an ornament to the room, besides being decidedly useful.

I thought our little cabin was about as nice and convenient as it could well be made. But last week John and I went to watch with a neighbor at some distance. He has been very ill all summer; the physicians say his affliction was brought on by over-work. He has never allowed himself a day of rest for many years. Always at work from earliest dawn till late at night; there were no Sabbaths or holidays in his calendar.

And now he is suffering untold agonies on that sick bed, his flesh slowly but surely decaying, and oh! so sickening to those who must of necessity attend him! His home is a lowly cabin such as ours was when we first moved into it. In that room he must lie, and endure all the noise and confusion of the work of the household, eating and sleeping, all in the same apartment. It is positively dreadful to think of bearing the affliction of the sick man in such a place, and equally dreadful to think of cooking and eating there.

I came home fully determined to find ways and means to add another room to our cabin, within the next three months.

TO REPAIR VERY OLD CARPETS.

CARPETS that are considered past mending may be made to do longer service with "the least bit of labor," if one doesn't mind patches.

Have these as nearly the color of the carpet as possible and paste them on with flour-paste. Use plenty of paste and "spot" the pieces down well, and allow time to get thoroughly dry before being walked upon. When the edges wear up, a little more paste will fix them. Of course, this should be done while the carpet is on the floor.

We once made a rag carpet do duty for three months on the kitchen floor after it had been voted "too shabby to be seen" by treating it in this way. A. E. STORY.

THE CANNING QUESTION.

I HAVE always put up tomatoes in quart cans of glass, and have had them as good in twelve months as the day they were put up. Many housekeepers complain that they have poor luck in canning tomatoes—so many cans spoiling—and think they are rather difficult to can and keep. I agree with Mary Wager-Fisher that the Melville is *the* can, but that will not last forever, at least the rubbers will not. They become so hard that they are good for nothing. I have several now that cannot be used on this account. My cans were bought 10 to 12 years ago.

But where can the Melville be found? I have not seen one for sale in three or four years. I would like to get some more of them and new rubbers for my old ones. Has the company given up manufacturing them? The Mason and Gem are about the only ones to be found, and I am always in trouble with them, as I am obliged to buy new bands every year. If we could get the Melville and extra rubbers at the same time, they would last a long time.

AUNT MARY.

To Starch Mourning Calicos.

If the lady who wished to know how to starch dark calicos would use coffee instead of water, or dissolve a piece of logwood in the water before stirring in the starch, I think she would be pleased with the result.

MOLLIE CRUMPACKER.

To Grease Boots.

Cut part of an old rubber shoe in fine strips, add hog's lard, place on the stove with the rubber, dissolve, then set away until cool.

S. F. BAUMGARTNER.

Adding Water to Sausage.

Do not add water to your sausage if you wish it to keep well. Season it before putting through the machine. It will then be already mixed. AUNT MARY.

QUESTIONS ANSWERED.

Mending Rubber Shoes & Boots.

Can you give me a recipe for mending the above? S. F. BAUMGARTNER.

ANS.—We will republish directions given in RURAL of Jan. 11, 1879. Dissolve four ounces of pure India rubber and an eighth of an ounce of powdered asphaltum in five or six times the quantity of benzine. Put together in an old tin can, cover tightly, and let stand three or four days; then work it well with a stick, adding benzine if necessary, so that the mixture will be of about the consistency of honey. Scrape the polish from the rubber; apply the cement to each part; let dry half an hour; put on another coat; let dry ten minutes when the parts may be pressed together.

Apple Jelly from Cider.

Will some of our readers please give E. R. Shankland their experience in making jelly from cider?

Blue on Silk.

Please give me a recipe for coloring blue on silk. MRS. S. S. OTIS.

ANS.—Use Leamon's Aniline blue dye. This can be purchased from any druggist for 25 cents.

Verdigris and Mildew.

Please tell me how to remove verdigris from linen, also what will take mildew out of linen?

ELLEN L. POTTER.

ANS.—1. We do not know. Try a weak solution of oxalic acid, rubbing well. 2. Wet the cloth and rub on soft soap and chalk mixed together and place in the sun, or, dip into a solution of chloride of lime and water, an even tablespoonful to three quarts of water, and lay in the sun.

Trees, Seeds, Plants, &c.

E. & J. C. WILLIAMS,
Montclair, N. J.

Have a large *prime* stock of all the leading **Strawberries, Raspberries, Grapes,** and other Fruits at reasonable prices. Customers always satisfied. Catalogue free.

NEW STRAWBERRIES.

Longfellow (for late) **Warren** (for early). Largest and best. Hardy and prolific. Good shippers. Try them. Plants **$1.00** per doz.; **$5.00** for **100.** Circulars free.

News of the Week.

AGRICULTURAL NEWS.

Monday, March 8, 1880.

TWENTY new breweries were established in this country in January. An advance of $1 a barrel on beer is agreed upon after May 1st,—hops, more hops. The hop-growers of England are about organizing a company with a capital of $2,200,000 for the sale of their own hops.....On March 1st, Mr. Lowe of Ala., introduced a bill into Congress to abolish the tax on brandy made of apples, peaches and other fruits; also to repeal the tax on tobacco in the hands of producers..... .. Mr. Page of Cal. introduced a bill, same day, to admit steam-plow machinery free of duty.....And Mr. Berry, of Cal., fathers a bill for abolishing duty on grain bags and gunny cloth.....An unusually fine Dog Show will be held in Madison Square Garden, in this city on April 27, 28 and 29. The entries close April 12. This promises to be an unprecedentedly fine display, being the only one to be held in the East this year—Charles Lincoln, Sup't, 141 Fulton street; P. O. Box 1740.....Montreal is going to compete hard with Boston for the export cattle trade when navigation opens this spring. An unprecedently large number of vessels are engaged for that port ....It is said that immense quantities of beef can be put on board vessels at Melbourne at 4c. a pound; all charges to England are about the same, so that it could be sold there at a trifle over 8c. .....In Australia good beef cattle can be bought, it is said, for about one-third this price of the same sort here.....The Iowa legislature has passed a bill prohibiting the manufacture and sale of oleomargarine in that State, under heavy penalties by fine and imprisonment.....The Vermont Central and connecting roads have ordered estimates for an elevator of at least 500,000 bushels' capacity, for Boston harbor..... The recent London wool sales show marked advances in all grades of wool.....Recent exports of Kentucky tobacco have been chiefly to Spain and Italy. A steady advance in prices of Havana leaf tobacco is noted in Cuba.....The State Board of Agriculture of Nebraska has located the State fairs at Omaha for the next three years, on condition that the city furnish suitable grounds and buildings. The Board of Trade of that city took the matter in hand, and after full consultation with the merchants and business men of the city, the conditions will be promptly complied with .....Statistics of pork packing in Cincinnati for the season beginning November 1 and ending March 1, show that there was a decrease of 89,025 head as compared with the previous year. The decrease in pounds was 26,369,774; average gross weight, 266 31 pounds, a decrease of 4.27 pounds; aggregate yield of lard, 19,344,815 pounds, a decrease of 3,629,064 pounds. The increase in the aggregate cost of this year's supply was $1,417,268. The decrease in barrels of pork was 6,099; in cut meats, 11,639,655 pounds... ....Liverpool cablegrams of March 5 say that arrivals of grain were small for the previous week; demand for consumption had improved and prices of grain had advanced slightly owing to scarcity..... Finley Dunn says the United States now produces one-fourth of the wheat grown in the world, and there is an increase here of 25 per cent. every two years....An experimental cargo of fresh meat in a state of perfect preservation has been landed in France from Buenos Ayres. Live sheep are shipped by every steamer from that place to Europe

"A Drop of Joy in Every Word."

FLEMINGTON, Hunterdon Co., N. J.

Dr. R. V. PIERCE, Buffalo, N. Y.:

Three months ago I was broken out with large ulcers and sores on my body, limbs and face. I procured your Golden Medical Discovery and Purgative Pellets, and have taken six bottles, and today I am in good health, all those ugly ulcers having healed and left my skin in a natural, healthy condition. I thought at one time I could not be cured. Although I can but poorly express my gratitude to you, yet there is a drop of joy in every word I write. Yours truly,

JAMES O. BELLIS.

Coughs.—"BROWN'S BRONCHIAL TROCHES" will allay irritation which induces coughing, giving oftentimes immediate relief in Bronchitis, Influenza, Hoarseness, and Consumptive and Asthmatic Complaints.

Such names as Dr. O. W. Holmes, Washington Irving, and Ex-President Van Buren, have borne testimony to the efficacy of WHITCOMB'S ASTHMA REMEDY, which is for sale by druggists.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 6, 1880.

BEANS AND PEAS.—Trade has been moderate in beans since the recent heavy sale of 2,500 bbls. for Spain. Marrow are called; mediums hold up as prime marks are not plenty. Business is light in fancy sorts. Green peas quiet and 5c lower to sell. Southern B. E. peas would not bring $3.25 in wholesale lots: green peas $1.75@1.80; marrow beans prime $1.65@1.67; medium, prime, $1.45@1.50; medium, fair to good, $1.35@1.40; pea, choice, 1 65@$1.70; fair to good, $1.45@1.55; white kidney, choice $1.75@1.80; fair to good, $1.60@1.70; red kidney, prime, $1.70; fair to good, $1.65@1.69, turtle soup, good to prime; $1.75@1.80.

Receipts of beans 6,480; exports, 2,800 pckgs.

BEESWAX.—A small trade quoted 24 to 25¾ for Western and Southern.

Exports for week, 6,125 lbs.

BROOM CORN.—Offerings are small and prices held steady Quotations are for choice brush at 9c.; choice hurl at 8c.; stalk brald at 6@7c.; mixed red and green at 5@6c.

BUTTER.—Old prices were well supported until within the past two or three days and all grades outside of fine fresh are 1@2c. lower. There are not enough of fancy grades to rule the market at this date, and the advance put on under grades was a mistake, as it checked consumption to a degree that may prove damaging in future sales of medium stock Strictly speaking there is but little stock to name as first-class and few dealers have any fine tops left on dairies of State. Western butter is extremely weak and can hardly recover, with spring so close upon us. Creamery, fresh invoices, 37@38c.; good to prime, 35@36c.; fair to good, 30@35c; poor to fair 27@30c.; full 2@30c.; early 2@2c.; State, pails and tub fall, choice 28@30c.; good to prime 26@28c.; fair to good 23@26c.; poor to fair 20@23c.; pails and tubs, single dairy, fresh choice 32@33c.; fresh, good to prime 28@30c.; fresh, fair to good 23@25c.; dairies choice 25@27c.; good to prime 24@25c.; fair to good 22@23c.; poor to fair 19@22c.; bodies of dairies 18@19c; very poor 16@18c.; Western imitation creamery 22@28c.; dairy, fresh, extra 25@26c.; good to prime 22@24c.; fair to good 21@22c.; poor to fair 14@17c.; special factory marks, extra 23@25.; prime 20@21c.; fair to good 18@19c.; poor to fair 17@19c.; very poor 14@17c.; roll butter prime 18@21c.

Comparative receipts and exports:

Jan. 1, 1879 to Mar. 1, 1880,	1,215,451	268,544
Jan. 1, 1878 to Mar. 1, 1879,	1,180,047	249,9 0
Jan. 1, 1877 to Mar. 1, 1878,	1,0.6,077	148,721

CHEESE.—The market has been very dull this week and easier, with shipments only 7,110 boxes. There have been free sellers at the concessions.

Quotations for State factory are: at 14¼@14¾c.; good to prime at 13¾@14c.; fair to good at 13@13½c; do. poor at 12@12½c. State farm dairy: good to prime at 13¾@14¼c.; fair to good at 13@13¾c. Ohio factory: Cheddar, fine, 14c.; do., fair to good, 12¾@13½c.; flat, fine, 14¼@14¾; flat, fair to prime, 13@14c.; flat, fair to good, 12¾@13¾c.

Receipts for week, 4,538 boxes; exports, 5,400 boxes. Liverpool cable, 71s., which is lower. Steam, 31s. 6d. @35s.

COMPARATIVE RECEIPTS AND EXPORTS.

	Rec'ts, boxes.	Exp'ts, lbs.
June 1, '79, to Mar. 1, '80....	2,253,615	101,701,164
June 1, '78, to Mar. 1, '79....	2,853,018	121,222,989
June 1, '77, to Mar. 1, '78....	2,270,386	99,331,138

COTTON.—There has been a good degree of business and prices closed steady at for March, 13.18@13 21c.; April, 13.32c.; May, 13.52@13.53c.; June, 13.71@13.72c. July 13 88@13.89c.; August, 13 91@13.92c.; September, 13.45@13.46c.; October, 12.60@12.62c.; November, 12.20@12.23.; December, 12.16@12.18c.

DRIED FRUITS.—In apples there is in good business and more sun dried stock could be handled at strong prices. Peaches are quiet and steady. Small fruits are wanted and blackberries are decidedly higher. Quotations are for N. C. apples, fair to good, 7¾@8¼c.; choice, 8@8¾c.; fancy at 10@10½c; Virginia, at 7@8c.; New York State quarters, at 7@8c.; sliced at 7½@8¼c.; patent evaporated, choice in cases, at 13½@14c.; primeat 12½@13c. Evaporated peeled peaches, at good to choice, at 22@25c.; unpeeled at 12@14c.; North Carolina peeled, fancy, at 20c.; choice old at 17@18c.; Georgia prime at 16@17c.; fair to good at 14@15c.; common at 10@12c.; unpeeled halves at 7½@8c.; do. quarters at 7@7½c. Pitted cherries at 18@19c. Blackberries at 12½c. Raspberries at 26@27c. Plums at 17@18c.

EGGS.—Receipts for the week, 13,200 bbls.; do. last week 11,162 do. The week has been an unsettled one and results in a decline compared with the last report. The demand is quite active but is chiefly local. The market lacks its usual outside call that helps to enliven trade in Lent.

Near Points, ¢ doz., 31c.; State and Penn. 15@13½c. Western, fresh, 13c.; Southern, 12@12½c.; Western and Canada, inferior, 11@12c.; limed are very dull and decidedly lower, quoted 8@10c.

FEED.—sales of 40 to 60 lbs. at 22@$23; 100 lbs at $23@$24 and sharps at $23.50@$25.

FLOUR.—There have been full offerings, the export demand light, and prices weak. Latest prices are $5.40@5.50 for poor to fancy superfine State: $5.40@5.65 for inferior to good extra do., odd lots and lines: $5 65@5.90 for good to very choice do.; $5.00@5.50 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $5.40@5.85 for inferior to good shipping extra do., and $5.65@5.85 for good to very choice shipping extra do.: inferior to about choice white wheat extras $5.90@6.75; about choice to very fancy do. $6.75@8 the latter an extreme: red and amber winter wheat, inferior to very fancy trade and family, at $5.85@7.75; round hoop Ohio, $5.60@6; and trade and family brands of do, at $6.10@7.75; the latter rate for very choice; St. Louis at $6@6.75 for inferior to very good extra; $6.75@7.75 for very good to very choice; Minnesota clear, inferior to fancy, at $5.60@6.75; Minnesota "straight," inferior to very fancy, at $5@7.75 and patent inferior to fancy at $6.75@8.75; unground stock at from $3 25@5.75; city mill extra at $6.40@6.85 for ordinary to fancy for West Indies; do. for England, $5.50@5.75 for poor to choice; do. trade and family extras, $6.75@7.75; do. for South America, $6.75@7.10; No. 2 at $3.65@4.90 for poor to very fancy (the latter an extreme).

CORN MEAL.—Sales at $2.50@3.10 for yellow Western and $3 30 for Brandywine.

FRESH FRUITS.—Exports of apples for week, 4,825 bbls. There is an easy feeling in the apple trade and few large orders executed. Baldwins and Greenings range at 2@$3.25; russets, 2.50@$3; fancy red, $3.50@3.75. Strawberries are in good, steady supply, and though quality is attractive the weather does not favor sales. Cbas., 20@25c. ¢ qt.; Florida, best, 40@50c.; Fla., Wilsons, 25@35c. Cranberries firm and steady, with a continued call from the the West. Cape Cod, bbls., $8@10; other Eastern, $7@9; N. J., crates, $2.75@3.25. The season is growing late for Fla. oranges and choice are tending higher. A marked feature in the trade this year is a demand for single boxes for family use. Fancy half bbl. cave, 4.75@$1.50; common to good, $2@3.50. Peanuts steady, with a moderate resumption of business. Va., hand-picked, 5¾@6c.; extra prime to fancy, 5¼@5½c.; good to prime, 4¾@5c.; shelled, 5½@6c. Hickory nuts, 75@90c. Pecans, 9½c. New B. walnuts, 62c. ¢ bush. Confectioners have become very regular buyers of B. Walnuts during the past two seasons.

GRAIN.—Of wheat offerings have been liberal and prices lower, giving a fair amount of business for export. Latest sales are of No. 1 white at $1.45½@1.46¾; do., March, at $1.46@1.46¼; do., April, at $1.46@1.46¾; do., May, at $1.44½@1 45; No. 2 white at $1 44½c.; ungraded white at $1.40@1.41¾c.; No. 2 red $1.44@1.45¾; do., March, at $1.45¾@1.48¾; do. April option, at $1.49@1 50¾; do., May, at $1.47@1 47¾; ungraded red at 1.41@1.47; No. 2 Milwaukee at $1.46; New York No. 3 spring at $1.35¼. Rye at 95@97c. for No. 2. Corn has been wanted and prices higher; latest sales are of New York No. 2 at 60¾@61c.; do., March, at 59½@59c.; do., April, at 59½c.; do., May, at 58c. bid; New York steamer mixed at 59¼@60c.; do., March, at 56c.; do.; April at 54½c.; ungraded mixed western at 58@61c.; New York No. 2 at 58½c.; rounds yellow, 60c.; yellow western at 61c.; yellow Southern at 59@61c.; white Western at 61@62c.; steamer white at 61c.; New York No. 2 white at 61c.; low mixed at 61c.; Oats are a trifle better and trade fair; latest sales are of No. 1 white at 51½c.; No. 2 white at 49c.; No. 3 white at 48c.; New York No. 1 at 49½c.; New York No. 2 at 49@49½c.; do., March option, at 48@49c.; New York No. 3 at 48c.; ungraded white western at 49@52c.; ungraded mixed western at 46@49c.; white State at 50@51c.; mixed State at 48½@49½c.; No. 2 Chicago quoted at 49½c. afloat.

HAY AND STRAW.—Receipts are larger demand less active and prices easy. Shipping hay quoted at 70@75c.; retail lots at 80@85c. for medium and 90@95c. for prime; clover at 60@65c. Straw at $1@1.10 for long rye; 65@70c. for short rye, and 55@60c. for oat.

Exports for the week, 1,450 bales.

HOPS.—The export demand continues slack and brewers are doing very little with prices unsettled and favoring buyers. The quotations are for

	Cents per ¢.

MAPLE SUGAR.—There is an easy feeling in prices; large cakes 11@13c.; small cakes 13@14c.; syrup in tin 75c@$1 ¢ gal. Shippers should mark gross weight and tare on pkgs. and pack sugar so that it will not break or crumble.

OIL CAKE.—Western is quoted at $32 ¢ ton.

POULTRY AND GAME.—The demand for dressed is not above usual spring wants. Prices for extra fresh are something better. Some old lots remain to be quoted low.

Turkeys, N. J., good to prime, 12@14c.; State, Mich., N. Ohio and Penn., prime, 13@14c.; other Western, prime, 12½@13½c.; fair to good, 10@11c.; Western, dry-picked, 12@14c.; Phila. dry-picked, 12@14c.; Capons, Phila., large, 19@20c; small and slips, 15@17c.; chickens, winter, Phila., 15@16c. Phila., dry-picked, 14@15c.; Jersey, ¢ lb, 14@15c.; State, prime, 12@14c.; Western, prime, 11@13c.; fair to good, 8@10c.; poor to fair, 5@8c. Fowls, Phila., dry-picked, 10@12c.; Jersey, good to prime, 10@12c.; State, good to prime, 9@11c.; Western, good to prime, 8@9c; poor to fair, 6@7c. Ducks, Phila., dry-picked, 16@18c.; Jersey, 15@17c.; State, 16@17; Western, 14@15c. Geese, Phila., dry-picked, 10@12c.; Jersey, 9@11c.; State, 8@10c.; squabs, ¢ doz., white, $3@3.25; dark, $1.75@2. Live poultry is in fair demand, and with light supplies prime coops are firm Fowls, N. J., ¢ lb. 11@12c.; Western, ¢ lb, 10@11c.; roosters, old and young, 5@6c.; turkeys, hens, 10@11c.; toms, 8@9c.; ducks, Jersey, N. Y. and Pa., per pair, 75c.@$1; Western, 60@80c.; geese, Jersey, $1.62@1.75; N. Y. and Pa., $1.37@1.62; Western, gray, $1.25@1.50 white, 75c.@$1; pigeons, ¢ pair, 40@45c. Wild ducks are lower; quality generally against sales. A few Southern English snipe quoted $6. Wild pigeons, Indiana, per doz., $1.75; Missouri, per doz., $1.25@1.50; wild ducks, Canvas back, Havre de Grace, $1.10@1 75; Norfolk, $1.25@1.50; Redhead, H. de G., 60@75c.; Western, 50@75c.; Norfolk, 40@50c.; Mallard, Western, 30@40c.; do. and Black, Norf., 30@40c.; teal, 25@30c.; common, 15@20c.

PROVISIONS—Have been more active on export demands and closed strong. Mess pork quoted at $11.75; $12 for old and $12.50 for new on the spot; 12.40@$12.50 for March and April, and $12.50@ 2.60 for May. Bacon at $7.25 for long clear and $7.50 for short clear. Beef hams at $16.50@17. Beef—Extra mess at $11@12; plain mess at $10 50@$11; packet 11.50@$12; tierced beef, city extra India mess, at $20@22.50; do. Philadelphia at $20. Tallow at 6¾c. for prime. Stearine at 7¾@7¾c. for Western. Lard—Western steam at $7.70 for spot lots; $7.65@7 67½ for March; $7.67½ for April, $7.72½ for May, and $7.80 for June.

Receipts for the week, pork, 1,600 pkgs.; beef 720 do.; cut-meats, 32,900 do.; lard, 11,556 do. Exports pork, 1,308 bbls.; beef 1,513 pkgs.; cut-meats, 960,302 lbs.; bacon, 9,870,503; lard 4,755,738 do.

SEED.—Clover is strong and on demand; Western quoted at 7¾@7¾c. for prime and 8¼@8¾c. for choice and extra choice, and State at 9@9¼ for choice to extra choice, and 10@10½ for fancy. Timothy is quiet at $3.

TOBACCO.—Export demand has been very light but the home trade is good and prices steady.

VEGETABLES.—Exports of potatoes for week, 951 bbls. Market dull for both export and home use, and there is a large offering at inside figures. Sweet potatoes quiet. Bermuda, new ¢ bbl., $5@5.50; E. Ross, Nova Scotia, bulk, ¢ bbl, $1.37@1.75; Maine, per d.-h. bbl., $1.65@2.00. State do. $1.30@$1.62. State, in bulk, per bbl., $1.37@1.50; Prolific, N. S. per d.-h. bbl., $1.37@1,75; in bulk, per bbl., $1.25@1,62; Mercer, Nova

Scotia, bulk, per bbl., $1.12@1.37; Chili Red, N.S., bulk & bbl. 1.25@1.37; Peachblow, State, per d.-h. bbl. $1.75@$2; Snowflake, State, per d.-h bbl., $1.50@1.62; Peerless, State do. $1.25@$1.37; bulk, per bbl., 1.25@ $1.37; Jersey bulk, do. $1@$1.12; Sweet potatoes, do. $3 00. Onions show a recent decline. Southern stuff plenty for the season. Tomatoes, Florida, per box, 60c.@$1.00; Nassau, 50c. 1.00; Bermuda, 50@ 85c.; beets, Bermuda, new, per crate, $1.25@1.50; green peas, Sav., $2.00@3.00; Cuba, $2@3.00; Fla., small, $1@ 2; do., marrowfat, $1@1.50; kale, Norf., per bbl., 50c.@ $1.50; Balt., per bag, 75c.@$1.25; spinach, Norf., per bbl., $2@2 50 Balt., 1.2 6@1.50 radishes, Norfolk, per 100 bunches, 1.50@$3; lettuce, southern, per bbl., 3@$5; squash, marrow, $1.75; Hubbard, $2 50@3; cabbage, per 100, $3@8 onions, white, $3.50@4.50; yellow, 3@$3.25; red, Eastern, $4.00; Chester, $2.75@$3.00; beets Jersey 1.00@$1.25; Turnips, Russia 75c.@$1.00; carrots, 75c. $1.25.

WOOL.—Demand has been active and prices strong, but no higher. Latest sales are of X and XX Ohio at 55@57½c.; ¾ blood Pennsylvania at 62c.; medium Pennsylvania at 60c.; No. 1 Montana at 34c.; fall California at 25@30c.; spring do. at 39c.; fall Texas at 26@28c.; unwashed Ohio at 40½c.; Montevideo at 38@ 41c.; Donskoi at 37c; Cape at 32@37c. Australian at 40c.; East India at 40@45c.; Mexican at 23c.; Montana at 38c.; Oregon at 42½@47c.; Colorado at 32c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, March 6, 1880.

BEEVES.—Receipts for week, 9,199 head; do. last week, 10,460 do. With light receipts the market has ruled very favorable for sellers: more than three quarters of the offering sold at a range of 9@10¼. The transactions at the close 8¾@9c. live weight for common dry cows and bulls 8@9c to 55@58 lbs. for several car loads of coarse to good oxen; 8½@9¾c. to dress 55@ 6 lbs for common to fair steers, with good and choice at 9¾@10½c. to dress 58@57.

COWS AND CALVES.—The market has ruled dull has been quoted at $5 per head lower for fair qualities. Buyers will be apt to hold off now until fresh milkers are plenty.

VEAL CALVES.—Receipts of live moderate, but dressed ill out market wants. Live calves N. J. & Bucks Co. choice 8@8½c.; prime 7¾@8c.; State choice 7¾@8c.; State prime 7¼@7¾c. fair to good 6¾@7c.; Mt. Holly 7@8½c; butterm'lk 4@5c.; gross 2½@2½c.; hog dressed, choice 10c.; good to prime 8½@9½c.; other 7@9c.; gross, hog dressed 4½@5½c.

SHEEP AND LAMBS.—Receipts for week, 19,771 head; do. last week, 18,871 do. Light supplies and advance in wool. Skins have kept prices quite strong. Heavy sheep not wanted this week. Sheep quoted 6¾@6¾c.; anything held above was neglected.

SWINE.—Receipts for week, 29,224 head; do. last week, 28,305 do. Prices have ruled easy and close weak. $4.10@4 85 last quotations. Country pork, light, 6¾7c.; med um 6¾@6¾c.; heavy, 5¾@6c¾c.; city dressed, 6¾@8c.; Western do. 5¾c.

STOCKBRIDGE MANURES For 1880.

Some years ago the Stockbridge Manures were only known to a few farmers in the Connecticut Valley. Now they are so extensively used in different parts of the country as to require two large factories, one in New York and one in Boston to manufacture them. This increase shows what farmers think of good fertilizers, and is not only due to the fact that they are reliable, well-made, and high-grade manures, but also to the fact that farmers have

FOUND THEM PROFITABLE TO USE.

Now that corn, and other farm produce is bringing such good prices, we anticipate that farmers will invest still more largely in our fertilizers.

Besides the Stockbridge Manures, we manufacture several high-grade Phosphates, and deal in first-class chemicals of all kinds. Farmers who intend to use Fertilizers of any kind, should

THE MAPES COMPLETE MANURES FOR EACH CROP.

A few Reports (Extracts) from well known Potato-Growers and Farmers in the Use, during the past Season, of the MAPES POTATO MANURE.

MESSRS. TEN EYCK BROS., Truck Growers, etc., Matawan, N. J., report Nov. 1, 1879: "Yield on eight acres nearly 1,800 bushels of potatoes. No acre fell below 180 bushels per acre, while some parts of the field did not fall short of 240 bushels per acre—95 per cent. marketable. Land was in poor heart. The yield of the rows left unfertilized was too poor to be considered of any market value; the difference was so great as to make it difficult to state the degree. The season might be called a good average one, until the heavy rains that occurred in August, which seemed to have a killing effect on the vines of the earlier sorts. A marked difference of **more than two weeks** were unexpectedly seen in the **early** maturing effects of these fertilizers, over a good dressing of coarse yard manure, which was clearly proved on a separate piece, planted with the same variety of potatoes, and the yield one to *four* in favor of the special manures and of *far better quality.*

"Having had an experience of over thirty years in this line of business, we are firmly convinced that better paying results will follow the judicious use of your Concentrated Manures for farming crops, than in the use of the stable manures of the cities, at such prices as they seem to command."

"The cost of these potatoes, grown as above, for the manure, including freight, cartage, and spreading, was **twenty-three cents a barrel**, or about **eight cents a bushel.** If there be a merchantable manure that will reduce that cost under like circumstances, we should like to learn what it is, and where it can be had."

MESSRS. E. & J. C. WILLIAMS, Nurserymen, Montclair, N. J., state in their last issued cat alogue that they grew during the past season from a single barrel of their "Late Rose Potatoes," 240 bushels with the Mapes Potato Manure.

MR. JOHN T. LOVETT, Vice-Pres. "American Association," writes, Jan, 1880: "I had startling results from the use of the Mapes Potato Manure the past season on poor light land. Had finer potatoes and more of them than my neighbors who paid *four times* as much money for stable manure."

MR. FREDERICK MORTON, Rocky Hill, Conn., reports, Oct. 21st, 1879: "On very poor soil, natural yield only 25 bushels per acre, grew 240 bushels potatoes per acre with 700 lbs. of the Mapes Potatoe Manure. The potatoes grown with your manure were all of **two weeks earlier** than those grown with the stable manure (10 cords applied per acre)."

MESSRS. W. B. & O. C. KNAPP, farmers, Round Hill, Fairfield Co., Conn., report, Dec. 15, 1879: "Think the Mapes Potato Manure worth its cost in *keeping the worms* from eating the crop. 400 lbs. per acre, broadcasted and harrowed in, produced a much larger yield than grown with either barn-yard manure or compost of hen-manure, ashes, and plaster."

810 Bushels (Burbanks), from 10 bushels seed on two acres.

WILLIAM S. ROBINSON, Mattituck, Suffolk Co., L. I., Feb. 18, 1880, reports: "Soil, good loam; season good for potatoes; planted last of April; Burbank seedling potatoes; applied four bags per acre (costing $30), of the Mapes Potato Manure; Fertilizer was applied in the drill."

Planted 10 bushels of seeds on certainly not two acres of land, and got 810 bushels of your good potatoes; not over two bushels in 130 of small ones.

Used 800 lbs. of the Mapes Potato Manure per acre and nothing else; probably the heaviest crop ever raised in Suffolk County.

Some other Crops grown with the MAPES MANURES past season.

430 BARRELS CAULIFLOWER from 13½ acres—and 225 bushels potatoes per acre.—JOHN CAMPBELL, Hutchogue, Suffolk Co., N. Y.

500 BUSHELS ONIONS per acre—350 bushels with stable manure, and 250 bushels per acre on natural soil. F. W. PUGSLEY, Poughkeepsie, N. Y.

"600 BUSHELS PER ACRE of as nice onions as ever grew."—"One bushel of the White Onions took the **First Premium** at the Norwalk Fair. It would have been useless to have tried to get half **a crop** without the Mapes Onion Manure." (Complete Manure for light soils.)—CHARLES A. MEEKER, Southport, Conn.

"This is the first special manure I ever used that grew a crop of onions equal with hen manure."—A. N. HOPPE, Chester, N. Y.

105 BUSHELS WHEAT from 2½ acres; 200 bushels potatoes per acre on light soil; turnips far superior in size and quality to those raised with barn-yard manure.—HENRY C. HERRING, Spring Valley, N. J.

FIVE PREMIUM CROPS OF ASPARAGUS grown during the past three seasons at Oyster Bay, exhibited at Spring Exhibitions at Mineola, L. I., were raised with the MAPES ASPARAGUS MANURE. Successful competitors were VALENTINE FROST, Locust Valley, L. I., and GEORGE H. TOWNSEND, Glenhead, L. I.

44 BUSHELS BARLEY per acre on heavy loam.—J. LAWRENCE SANFORD, Southampton, Suffolk Co., N. Y.

PREMIUM POTATOES "grown with the Mapes Manure—Queens Co. Agricultural Society, Town of Oyster Bay."—RICHARD D. COLYER, Woodbury, L. I.

PREMIUM POTATOES, "Best Early Rose," grown with the Mapes Manure—Agricultural Fair at Mineola, L. I.—T. CARLL BAYLIS, Mineola, L. I.

PREMIUM ROSES, Sweet Williams, etc., grown with the Mapes Manure—Queens Co. Agricultural Fair, Mineola, L. I.—WM. A. BURGESS (Dosoria), Glencove, L. I.

TWELVE Medals and Awards given to the Mapes Manures by the State Agricultural Societies and Institutions in Connecticut, New Jersey, and New York States during the past two years.

Mapes Potato Manure, per ton	$48

Send for it. Address,

D. M. FERRY & CO., Detroit, Mich.

GREGG RASPBERRY.

The most wonderful black raspberry known. For genuine plants, or catalogue, Send to the subscriber, who has 13 acres of them in bearing.

N. OHMER, Dayton, O.

Reading for the Young.

FLORICULTURE FOR YOUNG PEOPLE.—No. 3.

JOHN N. DICKIE.

ANTIRRHINUM (Snapdragon).—This flower is catalogued as a perennial, but I should describe it as a biennial flowering the first season. I have never been able to keep it over two years in this latitude. Seed germinates readily, but be careful not to sow it too thick. Set the plants one foot apart. In August cut the plants back and they will produce shoots which will keep green nearly all winter and flower better the second year than the first. Seed of the mixed varieties is best, as selected seed is inclined to sport.

ASTER.—This flower has been wonderfully improved of late years. It is not a perpetual bloomer, rarely remaining in perfection over three weeks; but on account of its great beauty should find a place in every garden. In order to have a continued show, sow part of the seed in April and the rest in May. Almost any of the varieties found in the catalogues will give good satisfaction; but I will name *New Rose* as a particularly choice sort.

BALSAM (Touch-me-not).—No flower can give my young readers greater satisfaction than this. They are perfectly double and grow freely from seed. Do not set out the plants before the middle of May, and when the plants make four sets of leaves pinch out the center shoot and keep the side branches well trimmed. All the Balsam requires is moisture and plenty of manure. They are, therefore, much finer in wet than in dry seasons.

BROWALLIA.—I began the cultivation of this flower about ten years ago, and expect to grow it as long as I am able to handle a hoe. The flowers are small, in color blue and white. The blue I prefer, as that color is more rare. It increases in size and beauty until frost, and can then be taken up and potted for the house. Set the plants not less than eighteen inches apart, for it will grow two feet high in a rich soil. The seed is very fine, and the plants, as they appear, very minute. Sow on the surface of the soil, and sprinkle a very little earth thereon, pressing down with a board. If you sow deep it will never appear.

CELOSIA (Cockscomb).—A well grown plant of this superb flower is worth a whole bed full of the poor things one generally sees. Seed will germinate in three or four days. Thin out well, and transplant into the richest soil you have. By good cultivation I have raised "combs" sixteen inches long with stems eight inches in width. Let us see if some of our young readers cannot exceed this next year. The tall and dwarf sorts will give equally large heads. The other special sorts advertised in our catalogues I cannot recommend.

CENTRANTHUS.—Another flower not generally cultivated. It is a continuous bloomer, and were it not that the stem is a little clumsy it would be unsurpassed for boquets. Does not require very rich soil. Is very easy of cultivation, and will attract the attention of all lovers of delicate flowers.

DIANTHUS.—The varieties known as Chinese and Japan Pinks are not fragrant but make up for this failing in habit, duration of bloom and coloring. Set the plants six inches apart and keep the seed picked off. If you neglect this they will not bloom over a month. The varieties Imperialis, Laciniatus and Heddewegii are the best.

MARIGOLD.—I cultivate but one variety of this plant which you will find in the catalogues, Tagetes signata pumila. The flower is as much of a marvel as the name, as it forms a dense globular mass as round as a ball, covered with flowers the whole season.

PANSY.—Sow seed as early as possible, and set the plants in a bed on the north side of the house or fence. Make the soil very rich, and water the plants every day or two thoroughly. This is the secret of raising fine Pansies. Water and manure—these will give your flower the envy of the whole neighborhood.

TEN WEEKS STOCK.—Truly a magnificent flower, but rather hard to succeed with. If left in the seed bed too long, the plants become drawn; and, as a rule, the seed purchased of our best seedsmen will produce a small proportion of double flowers. Still it is really worth one's while to meet with some failures in order to see a fine double Stock. I do not recommend this flower to my young readers with the same assurance as the other, but if you wish to experiment, let it be with the Stock.

VERBENA.—Seedling Verbenas are not so fine in color as those raised from cuttings, but the plants are larger, stronger and more persistent in bloom. Get the seed started as soon as possible and set the plants 18 inches apart. A bed composed wholly of rotted sod is best for the Verbena.

And now, dear young reader, I have given you a list of the best annuals for general cultivation. There are many others very desirable, and which I would not be without in my garden, but for a constant, brilliant show, those enumerated are the best. I shall conclude this series of articles with a chapter on the arrangement of flowers in the garden.

Morrow Co., Ohio.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—It gives me great pleasure to be able to write these lines to you to congratulate you on your success in forming the "Rural Horticultural Club;" and what a pleasant time you must have in reading the letters from the young members of the club, with now and then a line from the "old folks at home." But theirs no doubt are of but little satisfaction to you; yes, only a bother to you. I have but few words to say about out-door work at this present time. The severe cold has killed many so-called hardy plants shrubs and vines, but Hydrangea paniculata grandiflora must head the list of hardy or iron-clad shrubs. Roses of all kinds are dead down to the ground. I am so sorry, I will have to wait so long to see my pets again; but will place my hopes in an all wise Being that they will return in due time to make the air sweet with their fragrance.

Deutzias are too tender unless in very sheltered places. Forsythia veridissima the same. My much-petted Honeysuckle is entirely dead. I regret this as it is such a splendid vine or climber. The Trumpet Creepers are all alive up to this time. In looking over the beds of bulbs to-day, the Crocuses and Scilla also Snowdrops were making their appearance above ground and remind us of the coming spring.

Dear Uncle Mark, I wish to say a word regarding flower seeds or any other kind; now, I hope you will not consider me as a beggar of seeds, but I would thank you or any of the Rural Cousins for a few seeds of any kind they might have to spare. I only make this request having lost all such as well as other property by the "fire fiend." I well know the Cousins will return the many small favors they have received from me through the RURAL in times past. Thanking you for your kindness, I wish you success with the Rural Horticultural Club as well as other cares of life.

Oregon, Mo. J. W. MAPLE.

[J. W. Maple sent me last fall some flower seed for distribution among the Cousins. I have kept this to accompany my regular seed distribution to the members of the Horticultural Club, which will take place in a few days.—UNCLE MARK.]

DEAR UNCLE MARK:—I am only eight years old and can't write very well, but I would like to join the Club. I have a sister five years old and a brother five months old. Will some of the cousins please send a nice name for him? I am going to farm a good deal this year. We live on New River in Pulaski County, and have huge melons every summer. How we love the RURAL at our house! Sister read the last one nearly all to pieces. My grandma has a monthly rose in bloom in February. If I see this letter in print next week, I shall go out and stand on my head. I know you are sorry sister is not writing, but she has gone to Newbern to see her grandma. You have no nephew that likes you better than

Pulaski Co., Va. FRANK WYSOR.

DEAR UNCLE MARK:—I have been thinking about joining the cousin's circle for a long time, but have deferred writing until now. We have taken the RURAL for nearly thirty years, and like it very much. Maple Leaves wished us to tell about our gains and failures. I think that would be a good plan if we were all like her. "I have none to speak of." L. J. G.

Clymer, Chaut. Co., N. Y.

The Literary Revolution. Volunteers.

Our Friends know how, like "leaven," our books work when they get into a neighborhood. It is common for the sight of one to sell a hundred. In one case a sample of "Universal Knowledge" actually sold 1,000 volumes within a week. It got into a large manufacturing house, and "took" more rapidly than "small pox" ever did! Our customers invariably become our friends and volunteer to work for the Revolution.

Our Catalogue, handed to an acquaintance by one who knows our books or knows us, with one good word of commendation, will be of real and probably of great service to the "revolution." Will not every friend who receives an extra catalogue make such use of it? We will gladly send any quantity for wise distribution.

Remarkable Progress. The success of this movement continues to be without parallel in literary history. But little more than a year ago one large printing press was sufficient for its needs. To-day our facilities, equalled in extent by only a few of the old millionaire publishing houses, are taxed to the uttermost, but cannot meet the demands for our books. For weeks we have been running our presses twelve hours a day, recently extending the time to fourteen hours; as one set of hands cannot long endure such continued labor, we have already started two sets of hands, and the machinery, which never tires, will run the entire twenty-four hours six days in the week.

Type-Setting by Steam. It has not been commonly known that type is now set and distributed by machinery. It is a very interesting sight to see the machines at work which have set the type in our "Acme Libraries" of "History," "Biography," "Classics," and *The Library Magazine*. With their aid one man does the work of five by the old hand process. One office at work for us has twenty-six of these machines already, and more are building. Probably no invention ever more severely taxed the ingenuity of man, and none was ever more completely successful.

Three Great Books / Three Great Offers } To Readers of this Paper.

The old millionaire publishing houses, whose monopolies and power we are breaking, of course fight us as best they can. Many newspapers under their power and influence have refused us the use even of their advertising columns, and have propagated slanderous reports. The many thousand booksellers and agents of the country have commonly made the mistake of opposing their own, as it is the people's, interest, and we have sold books in spite of them, instead of by their aid. The best men of this class, however, are learning and accepting the fact that the "revolution" is in their interest also, as it vastly increases the sale of books, and our "Terms to Clubs" afford abundant profit to the bookseller who has $100 and a proportionate amount of brains to invest. The greatest enemy which the revolution has thus far met has been "incredulity." Some clergymen have thought we meant a "practical joke" by offering Geikie's "Life and Words of Christ" complete for fifty cents. Good people commonly have thought books could not be made so cheap. It is a simple fact that thus far it has cost us about as much to advertise our books and convince people that we are really telling the truth about them, as it has cost to manufacture the books themselves. If it were not for this immense tax for advertising, it would be possible for us to make prices even less than we have done. With the special object of demonstrating to *the readers of this paper* the great things which are being done for lovers of good books, and making further advertising unnecessary, we describe below *three great books*, one or more of which is sure to be wanted by every intelligent owner of 50 cents. They fairly represent our large and rapidly-growing list of Standard Books, in quality of paper, printing, binding, and illustrations.

First Offer. Either of the three books will be sent by mail on receipt of price and postage, and if not found satisfactory may be returned, at once, and the price will be immediately refunded.

Second Offer. To any reader of this paper who will cut out and return this slip within one week from the time he receives it, with the sum of $1 50, we will send the three books by mail free of postage, and either or all may be returned at once if not satisfactory, and the price will be refunded.

Third Offer. Any reader of this paper who will take the trouble to show this advertisement to his neighbors, and influence them to unite with him and order, within one week from the time he receives the paper, of the three books, to the value of $5 00, we will send the books free of postage or expressage, and send to him one book extra, for his trouble. Any or all of the books may be returned if not satisfactory, and the money will be refunded. This slip must be cut out and returned with the order, to secure these terms.

The Editors and Publishers of this paper know well both us and our books, that they are all we represent them, and that we do all we agree to do. If you inquire of your neighbors you will probably find some who have already dealt with us, for our customers are now found in almost every village in the United States and Canada.

Life and Words of Christ.

By CUNNINGHAM GEIKIE, D. D. Price reduced from $3 to 50 cts.: beautiful brevier type, neat strong cloth binding; postage, 8 cts.

"Profoundly interesting—marvellously cheap."—Albany Evening Times.
"It is fascinating reading."—Boston Commonwealth.
"The best of all the lives of Christ—a marvel of cheapness."—Portland Christian Mirror.
"A great and noble work, rich in information, elegant and scholarly in style, earnestly devout in feeling."—London Literary World.
"It is a work of profound learning.'—Archbishop of York.
"Simply indispensable to students of gospel history."—British Quarterly Review.
"A work of gigantic industry, of the highest literary rank, and breathing the spirit of true faith in Christ."—Dr. Delitzsch, the Commentator.
"It seems to me among books a pearl of great price, and a man might well sell a thousand others to become possessor of this one."—Harriet Beecher Stowe.
"Will last when we have all passed away—is by far the best."—Rev. C. H. Spurgeon.
"The most interesting book we have ever read on the subject."—Churchman, New York.
"The best book that has ever appeared on the subject."—The Homilist.
"A more thorough, careful and exhaustive work we have never read."—Baptist Magazine.
"Dr. Geikie's book is admirable."—Harper's Magazine.
"A neat volume, good enough type, handsomely bound."—Christian Standard and Home Journal.
"It is amazingly cheap and far the best life of our Lord."—Zion's Herald, Boston.

Acme Library of Biography.

Twelve standard books, at one time published at $1 25 each, now issued in one volume, beautiful brevier type, neatly cloth bound, for 50 cts., postage 8c., containing: "Frederick the Great," by Macaulay; "Robert Burns," by Carlyle; "Mahomet," by Gibbon; "Martin Luther," by Chevalier Bunsen; "Mary, Queen of Scots," by Lamartine; "Joan of Arc," by Michelet; "Hannibal," by Thomas Arnold; "Cæsar," by Liddell; "Cromwell," by Lamartine; "William Pitt," by Macaulay; "Columbus," by Lamartine; "Vittoria Colonna," by Trollope.

The Book of Fables.

Æsop's Fables, complete, with text based upon Croxall, La Fontaine, and L'Estrange, with copious additions from other modern authors, profusely illustrated by Ernest Griset. About 400 pp., cloth: price 50 cents: postage 8 cents. Ready March 10.

Our new edition of the Fables of Æsop we think will be found, for reading or reference, the best ever issued. It contains about twice as many of the fables attributed to Æsop as the edition we have hitherto published, with nearly as many more of later date. The type is a large long primer of a beautiful face, and the illustrations, nearly forty in number, are by the best artist who has ever pictured the wit and wisdom of the antique satirist.

VERDICT OF PRESS AND PEOPLE:

One of Many. It hardly seems possible, and yet this book is one of many, which are published by this house at low prices. It is a marvel in bookmaking. *Telegraph*, Pittsburgh, Pa.

A Country Parson's Opinion. I bid you God-speed in the worthy enterprise of giving us good literature and cheap. We country parsons can now fill our shelves with good books at small cost. *Rev. C. H. A. Bulkley*, Port Henry, N. Y.

The Important Problem. The American Book Exchange is solving the important problem of furnishing good and standard books at prices within the reach of all persons of moderate incomes. *Chicago Evening Journal.*

A Rich Relative? Has some rich relative left you a colossal fortune which you are spending in publishing books for the people at nominal prices? If so, I admire your taste. But wont the old-line publishers be glad when it is gone? *B. F. Congdon*, Randolph, N. Y.

Reliable—Too Strange to be True! The American Book Exchange is reliable. This we say from actual knowledge. It is almost too strange to believe that standard books should be published at so low a price, but it is an actual fact, and the books are well printed and bound. We unhesitatingly endorse the American Book Exchange, and commend its course in bringing the best literature within the reach of all classes of people. *The Central Baptist*, St. Louis, Mo.

Can't Lend Ours! To our friends of literary tastes we would say: Your lives will be intolerable without this work. Send and get it: we can't lend ours. *State Journal*, Jefferson City, Mo.

Editor of the Tribune. *Dear Sir.*—I desire with shame and confusion of face to take it all back, *i. e.*, what I wrote in my first communication. Since mailing I have received from the American Book Exchange the volume for which I sent. I now regard Mr. Alden as a benefactor, and shall endeavor to disseminate the knowledge of him and his wares among my acquaintances. Penitentially yours, *C. H. Bordman*, St. Paul, Minn.

"Wring your Neck." You are making a first-class name for yourself and house in this city outside of the general book men. They would, if they could, wring your neck if they dare. *J. H. Bentley*, Chicago, Ill.

Chambers' English Literature. So popular and descriptive in character as to interest the most unscholarly reader, it is so comprehensive and reliable as to command the respect of the most accomplished student of our literature, has the merit of compactness, portability, and inexpensiveness. Of course to meet these ends the type cannot be of the largest nor the paper of the thickest; but what deficiencies exist in these respects—and they are not material—are more than made up by the amazing cheapness of the work. The American Book Exchange deserves credit for the part it is taking in popularizing standard literature. *Christian Union*, N. Y.

OTHER STANDARD BOOKS.

PERSONAL ITEMS.

Snow was riding on horseback near Sonora, Cal. The horse threw him off, by kicking hard against a rock. He was about to give the beast a sound whipping, when he saw gold glistening where a piece of the rock had been broken off. Thus a valuable quartz lode was discovered, and a horse escaped punishment.

When Sir G. Wolseley leaves the Cape, Major-Gen. the Hon. Sir Henry Clifford, V. C. will assume command. He is brother of Lord Clifford, an excellent Roman Catholic peer, directly descended from the Cliffords of Charles II. a Cabal Ministry. "Clifford retired to the woods of Ugbrooke," writes Macaulay, "and Ugbrooke stands to-day, a secluded seat, in exquisite scenery, with a park which he planted, now a marvel of sylvan beauty.

"Nothing but Compound Oxygen Saved Me."

"Compound Oxygen has certainly *done wonders in my case*," writes a gentlemen from Eufaula, Indian Territory. "Before I commenced taking the Oxygen I had taken in the way of medicine about everything that was recommended for Consumption, to no effect. *I had been sick in bed for about thirty-eight months* in all, and in *less than three months* from the time I began taking the Oxygen *I was up and getting about.* Had been *given up by the doctors to die*, time and again; but I still live, and *believe that nothing else but Compound Oxygen saved me.*" A letter received five months later from a brother of this gentleman; says: "Your Compound Oxygen has in the case of my brother *performed such a miraculous cure—for we attribute it to nothing else*—that I have concluded to test it myself." A Treatise on Compound Oxygen, its Nature, Action and Results *sent free* by DRS. STARKEY & PALEN, 1109 and 1111 Girard St., Philada.

This valuable device is suited to wagons of any size—made of the best steel and warranted—are attached by four bolts through the bed—can be put on by any person. They remain on the wagon for all uses and work equally well whether with empty or loaded wagon. There is no use for a spring seat—they make a comfortable spring wagon out of a a farm wagon—and save largely in wear and tear. We want Agents everywhere. Send for description and prices, and mention this paper.
SEMPLE & BIRGE MFG. CO., St. Louis, Mo.

LA DOW'S JOINTED
Pulverizing and Smoothing HARROW.
Light, Simple, Cheap. Durable and Flexible

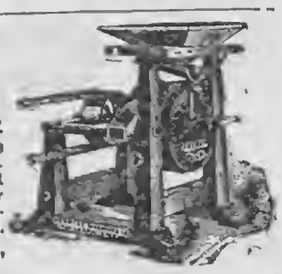
Being jointed in the center, is adapted to both smooth and uneven surfaces. Acknowledged the best of the kind, and will pulverize and cover seed better in one operation, than going over twice with others. Made with both Chilled Metal and Cast Steel Discs polished. Send for circular and price list. Manufactured by
WHEELER & MELICK CO., Albany, N. Y., for the United States.
By EVERETT & SMALL, Boston, Mass., for the N. E. States, and by BUDLONG & Co., Aurora, Ill., for Ill., Iowa, Wis., Minn., Neb., Kans. and Mo.
"Also, La Dow's Disc Corn Cultivator."

Union Railway Horse Power.

THRESHERS AND SEPARATORS.
These Powers are GUARANTEED to produce more Power with LESS ELEVATION than any other Railway Power. Send for descriptive catalogue. WM. L. BOYER & BRO., 2101 Germantown Ave., Phila., Pa. Also Manf. of Premium farm Grist Mills.

CLARK'S ROOT CUTTER.
Do not fail to see CLARK'S NEW ROOT CUTTER. The leading stock raisers in the country pronounce it the best and only cutter that cuts roots in shape for feeding.
Price No. 1.....$12.00
" No. 2..... 14.00
Send for circular.
HIGGANUM MFG. CORPORATION, Higganum, Ct., U. S. A.
Manufacturers of Agricultural Implements of all *description.*

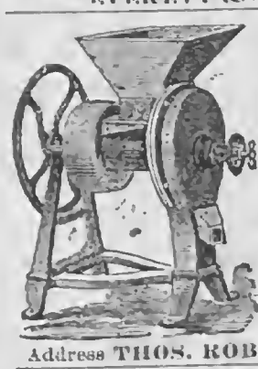
Mill Manufactory
Established 1851,
GRIST MILLS,
On FRENCH BUHR STONE



Portable Mills for Farmers, Saw Mills, etc.; 16 sizes; over 2,000 in use. Price from $80 up. Complete Mill and Sheller, $95. A boy can grind and keep in order. Adapted to any kind of suitable power. Complete Flouring and Corn Mills.
NORDYKE & MARMON CO., Indianapolis, Ind.

MATTHEWS' SEED DRILL
The Standard of America.

Admitted by leading Seedsmen and Market Gardners everywhere to be the most perfect and reliable Drill in use. Send for Circular. Manufactured only by
EVERETT & SMALL, Boston, Mass.



THE VICTORY
CORN MILL.
The Victory Corn Mill will grind corn meal coarse or fine, shelled or on the cob. Self Sharpening Plates. Made entirely of IRON AND STEEL. Very strong, durable, and warranted in every respect. Capacity, 10 to 20 bushels per hour. Send for circulars.
Address THOS. ROBERTS, SPRINGFIELD, O.

COPPER PATCH PLATE
For mending Tin, Brass, Copper, Lead or Iron without acid or soldering iron. Any lady or child can mend with it. Will send one sample plate by mail (with directions) that will cut 192 ¾-inch square patches, on receipt of 25c.; 3 for $1; 100 for $10. (Postage stamps received as cash.) AGENTS WANTED. Can carry one day's stock in your pocket. Sales will yield $3 to $15 per day. Our 64-page Illustrated CATALOGUE of Chromos, Jewelry, Novelties, Stationery, &c., Free. Address
CITY NOVELTY CO.,
108 South 8th Street, Philadelphia, Pa.

25 CENTS PER BUSHEL SAVED
in raising Wheat. For Illustrated Pamphlet giving full particulars and prices, Address
The Thomas Harrow Co., Geneva, N. Y

The Fittest Subjects

For fever and ague, and remittents, are the debilitated, bilious and nervous. To such persons Hostetter's Stomach Bitters affords adequate protection from the malarial pest, by increasing vital stamina and the resistant power of the constitution, and by checking irregularities of the liver, stomach and bowels, which increase the danger to be apprehended from miasma. Moreover, it eradicates malarial complaints of an obstinate type. The field in which this leading family medicine has achieved some of its most astonishing and amply proven effects, is a very wide one. In the malarious region of our own country, in South America, Mexico, and across the seas, it has given unmistakable evidences of its curative value. At home and abroad it has always sustained its high reputation, nor has it ever been affected by competition of so-called tonics represented to possess kindred or equal efficacy. It stands alone, unequalled among our national remedies.

Mamma—Did you give that poor man anything, my dear?
Miss Lovejoy—Yes, mamma, a smile!

HEADQUARTERS FOR THE CUTHBERT RASPBERRY

The Royalty of Raspberries.
The **CUTHBERT**
I have by far the largest and best stock in the country of this "Queen of the Market" as well as the Fruit Garden.
A superior stock of PLANTS of all the good old and *choice new varieties*, for spring planting, of
STRAW
RASP
BLACK
GOOSE
BERRIES
Grapes and Currants.
My new **Catalogue** for Spring (31 pages), gives complete instructions for planting and cultivation *honest descriptions and fair prices. Free to all.*

IF YOU HAVE A GARDEN, YOU NEED

CATALOGUE OF B.K. BLISS & SONS' HANDBOOK for the FARM & GARDEN
GARDEN, FIELD AND FLOWER SEED PLANTS
SMALL FRUITS AND GARDEN REQUISITES
SEEDSMEN 34 NEW YORK ST.

ESTABLISHED 1845.

150 pages. Over 300 Illustrations, and a Beautifully Colored Plate of Pansies. Mailed for 10 Cents.

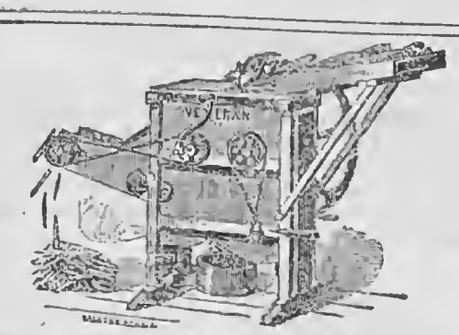
BLISS' ILLUSTRATED AMATEUR'S GUIDE TO THE FLOWER AND KITCHEN GARDEN contains more practical information on gardening than many high-priced books. Our list comprises 2,000 varieties Flower Seeds, 1,000 varieties Bulbs and Plants, 500 varieties Vegetable Seeds, 500 varieties Potatoes, etc. 220 pages, over 600 illustrations, 2 double-page colored plates of flowers. Price: paper covers, 35 cents; bound in muslin, $1.00.

BLISS' ILLUSTRATED POTATO CATALOGUE. 50 pages. A valuable treatise on the Potato and descriptive list of all the principal varieties grown. Profusely illustrated. Price 10 cents. B. K. BLISS & SONS, 34 Barclay St., New York, N. Y.

Cheese and Butter Manufacturers
should write at once for our new price-list of
Factory Supplies and Dairy Furnishing Goods.
We also furnish complete outfits. Address,
CHARLES MILLAR & SON., Utica, N. Y.

CIDER PRESSES AND GRATERS.
BOOMER & BOSCHERT PRESS CO., Syracuse, N. Y.

CHALLENGE FEED MILLS.
Grinds three times as fast as any other mills. Always successful. Over 500 First Premiums and Medals. Over 15,000 in use. They do not clog or heat; grinds 40 bushels per hour. All successful Iron Feed Mills *infringing our patents.* Beware: Buy none but the best. Remember the Courts have sustained our Patents. Also, the best Wind Mills, Corn Shellers, Horse Power Wood Saws, Fanning Mills and Pumps. Address
CHALLENGE MILL CO., Batavia, Ill.



Veteran Corn Sheller
FOR HAND OR POWER.
Just the Thing for Mill, Farm or Plantation.
Power and Hand Corn Shellers of all sizes and to suit all wants.
HORSE POWERS, JACKS, &c.
Write for Descriptive Circulars and prices. Address SANDWICH MANUF'G CO., Sandwich, Illinois.

COOLEY CREAMER.

Awarded Gold Medal at Paris Agricultural Exhibition, 1879.

Butter made by this process, awarded Sweepstakes at International Dairy Fair, 1878, and Two Gold Medals and First Premium at same fair, 1879. First Premium at Royal Agricultural Exhibition, London, 1879.
It requires no milk-room.
It raises all of cream between milkings.
It affords better ventilation.
It requires less labor.
It is more thoroughly made.
It is cheaper,
and gives better satisfaction than any other way of setting milk.
Send for "Dairymen" giving full particulars and testimonials.
VERMONT FARM MACH. CO.,
Bellows Falls, Vt.

THE RURAL NEW-YORKER

Ralph Evans

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XXXIX. No. 12. WHOLE No. 1573. | NEW YORK, MARCH 20, 1880. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

The Herdsman.

AYRSHIRE CATTLE.

OF the various breeds of cattle whose merits for the shambles or the dairy have won them popularity among English-speaking people, the Ayrshire is the most recent in its formation. The present century was from ten to fifteen years old before the cattle of Ayrshire, which have since become known by the name of the county in which they originated, can be said to have possessed those distinctive characteristics and that power of transmitting them with certainty to their offsprings, which would entitle them to be considered a breed. The changes wrought in the appearance of Ayrshires within the last half century, too, have been considerably greater than in animals of any other well known breed of cattle. Indeed, until the present or a very recent date, this breed may be considered to have been in a formative stage, or it may, perhaps, be more correct to say that the improvements made in it have been of a more radical nature than in any of the older breeds. As may be inferred from its comparatively recent formation, it is pre-eminently a breeders' breed, owing its origin less to environment and more to care and judicious selection than does any other breed equally well known. More than a century ago, it is true, the rough cattle of Ayrshire had a local reputation for hardy and deep-milking qualities; but the meagre descriptions that have come down to us of the animals of that day, show that they have little else in common with the peculiar characteristics that distinguish the Ayrshire cattle of to-day. How these have been inwrought into the breed is not clearly known; but it is certain that they are due in a great measure to a judicious infusion of the blood of other excellent breeds. The West Highland cattle and the Jersey, Guernesy, Short-horn and even the Holstein, are all supposed by different authorities to have contributed by direct crosses on the native rough but hardy stock, or by "dashes of blood," to the formation of the present breed, and some of the distinctive traits of all these breeds occasionally, by atavism, crop out in the modern Ayrshire cattle.

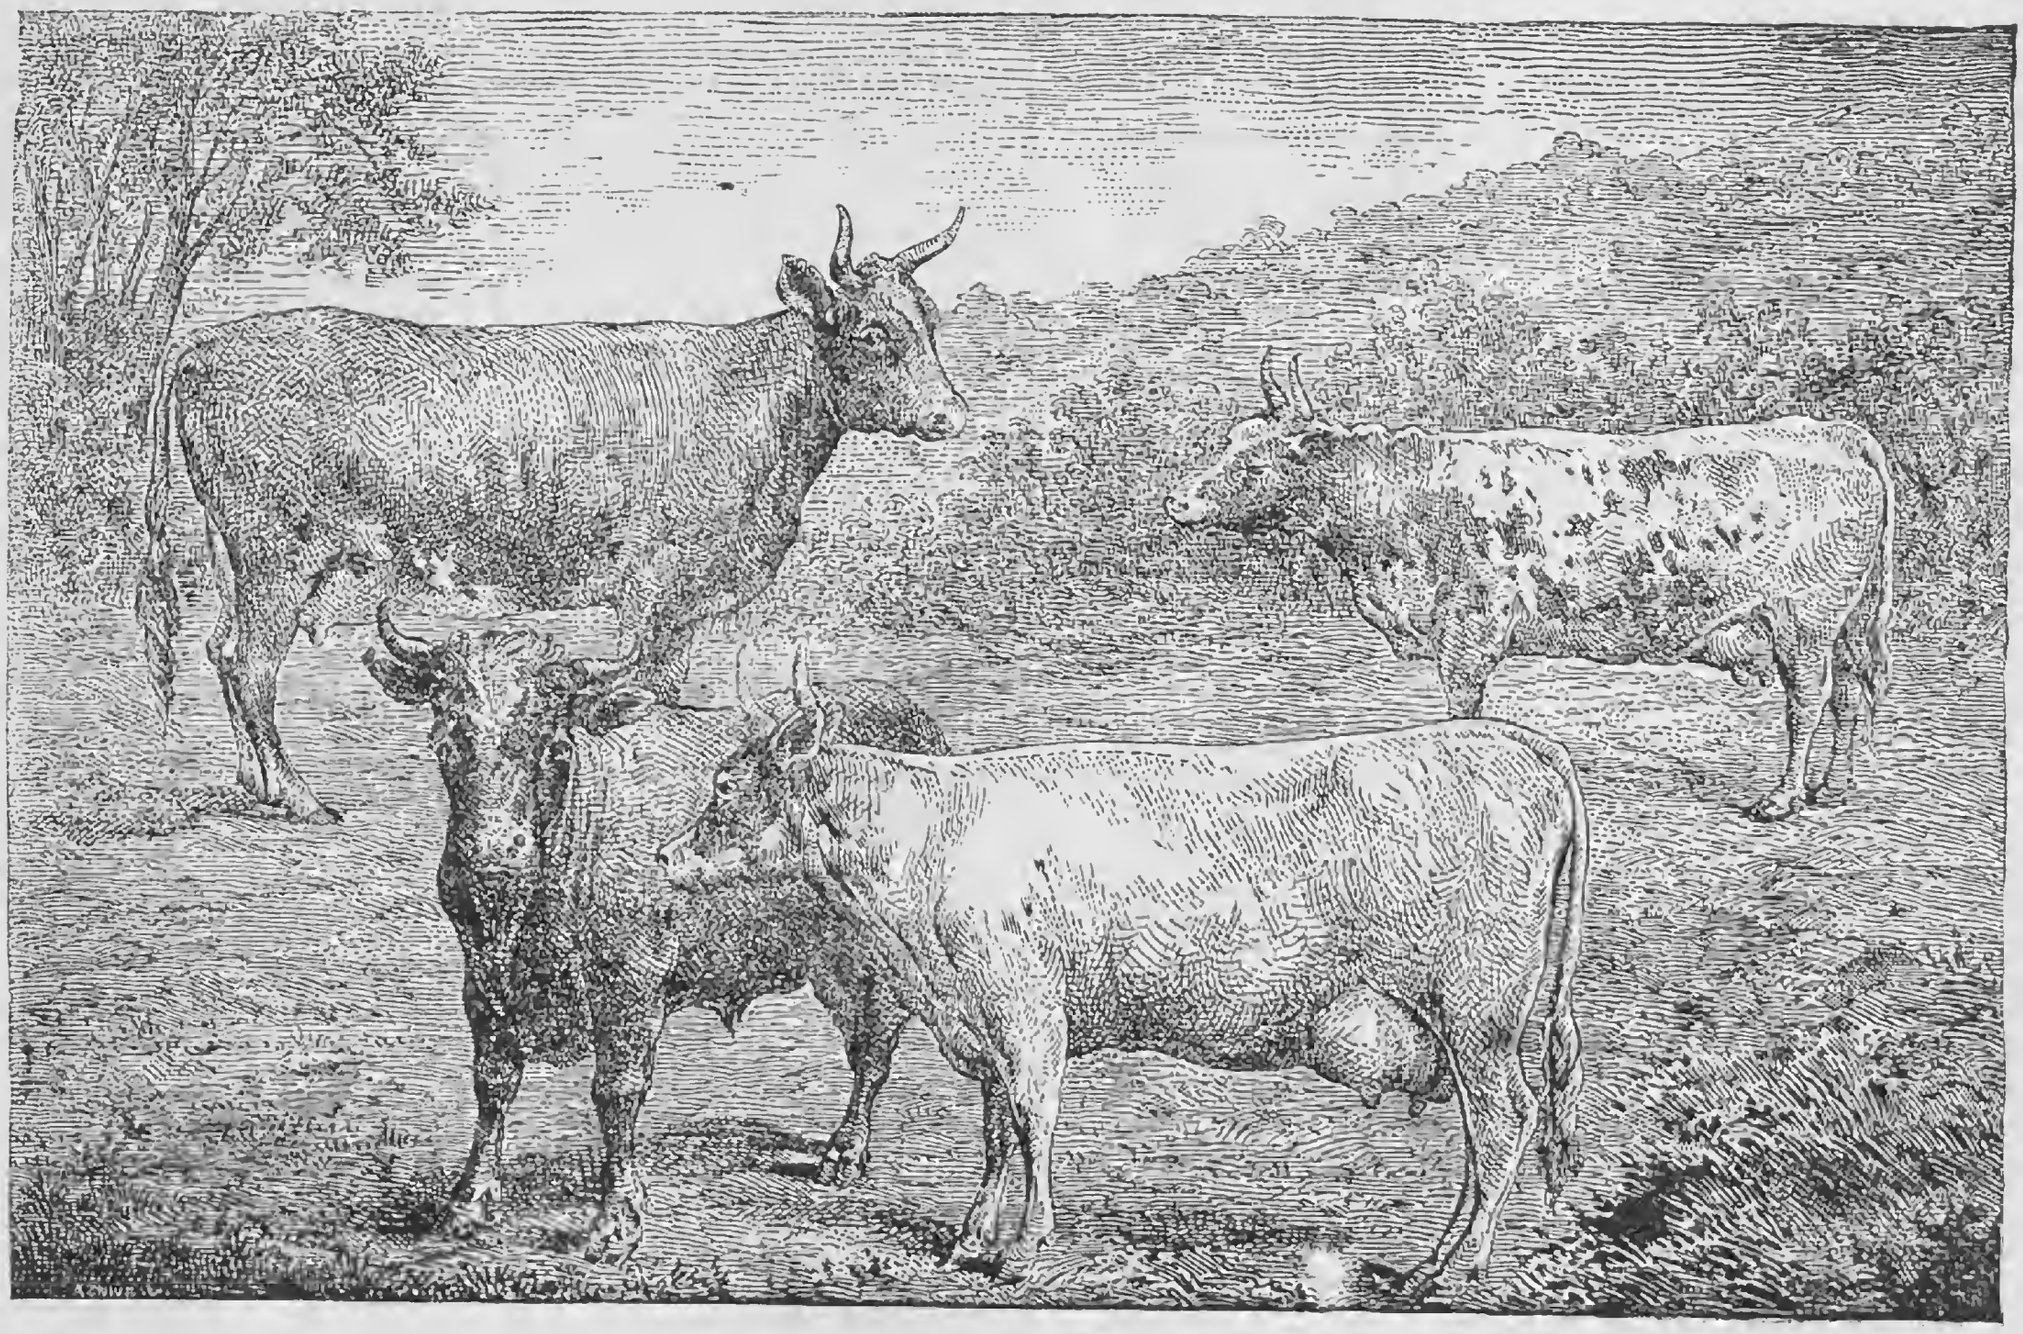
Small in size, short in the legs, excellent foragers, with fine, clean bones and not a pound of superfluous flesh about them, cows of this breed thrive and give large messes of milk where larger and less hardy animals would scarcely pick up a living. But although the Ayrshire manages to get along comparatively well on poor pastures and scanty fare, she makes a grateful return for generous food and treatment. Under such circumstances the records of the milk yields of cows of this breed compare favorably with those of any other, and in comparison with the amount of food consumed, good judges, speaking from experience with other breeds as well, declare that cows of no other breed can compete in milk yield with these. Under the microscope this milk is found to be rich in caseine and the cream globules are numerous but very unequal in size. This is generally held to be a defect of the Ayrshire as a butter cow, on the ground that cream does not rise well when the globules vary in size, nor is all the butter got out of it without skillful churning. Both here and in Great Britain, however, Ayrshires have made a multitude of excellent records as butter cows, although, it is true, their reputation for cheese is still higher.

When in milk the Ayrshire is an excellent machine for converting all her food beyond the economical requirements of her system, into milk. She lays on little or no flesh; all that goes into the month, beyond what is needed to run the machine, is poured into the milk pail. When dry, however, and well fed, she readily takes on flesh of an excellent quality in which fat and lean are much more evenly intermingled than is generally the case in the distinctively butchers' breeds. Although the meat is not laid on so heavily in prime parts as in the Hereford or Short-horn, yet it always brings a good price, and as a rule, the carcass weighs considerably more than the appearance of the live beast would indicate.

The favorite color of Ayrshires is a light brown or brown and white, though red and white is the most common. There are also among them a considerable number red, or mostly red, some white and red, a few flecked; and, now and then, a black and white or even a pure white is seen. The colors rarely mingle together, the line of separation being generally quite distinct. Dark red or black noses are the favorites; but a white nose is not looked upon as a drawback. The udder, the great point of the Ayrshire, should reach well forward and be firmly attached up to the body - not come out behind or hang down loosely.' The quarters should be alike in size and the teats be set on widely and equally apart, not hanging together under a loose, flabby bag. The head is preferably short; the forehead wide; the eyes full and lively; the horns set on wide, inclining upwards and curving slightly inwards; the neck long and straight from the head to the top of the shoulder, free from loose skin on the under side, fine at its juncture with the head, the muscles enlarging towards the shoulder; fore quarters thin in front, generally increasing in depth and thickness backwards; skin, soft and elastic; general form of body, when viewed from the side, wedge-shape. This peculiar wedge-shape form is due less to deficiency forward than to the large bulk of carcass aft.

Any faults? Yes; what is there wholly free from them in this sublunary world? The teats of young Ayrshire cows are, as a rule, inconveniently short; but with careful milking they become quite long enough after the cow has had a couple of calves. An unamiable trait common to them and their possible West Highland kindred, is a sleepless pugnacity of disposition towards each other. Although bred together, Ayrshires are always ready to rip up or gore each other when a good chance presents itself, and to prevent injury from this fault, it is advisable to screw wooden or metal knobs on their sharp-pointed horns.

The accompanying cut has been redrawn from a group of Ayrshires in Professor J. P. Sheldon's Dairy Farming, an admirable work which every farmer should possess.



GROUP OF AYRSHIRE CATTLE.—Fig. 88.

DASHES OF BLOOD.

COL. CURTIS is right, in the RURAL of Dec. 27, in supposing that the Lincolns get their name from the locality in which they were bred, as have also the Leicesters, Cotswolds, Cheviots, Hampshire and Shropshire Downs etc; but I scarcely get the drift of his meaning when he writes. "By Lincolns we do not understand a distinct breed before these "dashes" (Cotswold) were made, but a name for the sheep of a locality." If they were not a distinct breed before the "dashes" were made, how could they be afterwards? Introduce ever so little foreign blood, and your distinctive character is gone; as the Colonel truly says—they will be crosses. The produce of pure animals of distinct breeds can be nothing else but cross-bred, whether they be cattle, sheep or pigs.

Again, if a pure-bred animal of either sex be bred to natives or animals without a pedigree, the offsprings are called grades Leicester, Short horn or Ayrshire, as the case may be. Then breed that produce back again to another pure-bred and it would be called a ¾ grade and the next cross a ⅞ grade, and so on. The term "diluted cross" is generally used to indicate the one mentioned by G. G. in RURAL of the same date. For instance when Mr. Booth sent his famous cow Bracelet to Col. Craddock's Mussulman, the produce, Buckingham, was used very extensively. Mr. Booth was said to have taken a diluted cross, though in this case he was simply taking a cross outside his particular strain, not crossing distinct breeds but merely introducing blood of another tribe. R. G.

The Swine-Herd.

CARE OF BREEDING SOWS.

Practical Suggestions—Why Sows "go crazy."

COL. F. D. CURTIS.

WHEN sows have pigs they often get ugly, or as some farmers term it, "go crazy." The cause of this unnatural condition, when the mother, contrary to her maternal instincts, destroys her young, is not generally understood. Many suppose it to be pure ugliness, or "cussedness," and the frenzied mother is shown no mercy, and is condemned to be slaughtered as soon as may be. Years ago an intelligent breeder of pigs told me the cause of this trouble, and that prevention was the best, if not the only remedy. The trouble arises from constipation or from an inflammatory condition of the system. We make this nice distinction, because our experience warrants it. Constipation will, and always does produce more or less inflammation. When a sow is fed rich and concentrated food for a length of time, her whole system becomes feverish and inflamed, and at the same time the animal may not be in a constipated condition. A total diet of corn inevitably produces an inflammatory and excited state, and when the pains of parturition begin, the poor brute imagines her crying offspring, to be the cause, and in her frenzy she snaps at them with the ferocity of a tiger, and destroys them. We have known mothers thus ferocious in winter, when confined and fed on dry and concentrated food, in summer or autumn, when living upon grass or other succulent feed, to be the kindest and best of mothers. We are satisfied that there never was a sow which had young and bit, or killed them unless she was diseased.

A sow in pig should have as roomy a pen as possible. This will enable her to stir about, which is important, especially if she is to be confined in her diet to concentrated food. Such a sow should never be kept on corn alone, or any kind of grain. Oats are the safest and best if grain must be fed, as the thick skins make a more healthful distention of the bowels, and the grain is less heating than other varieties. Too much flesh is injurious. A lean sow will, as a rule, have more and better pigs than a fat one. A simple diet is the best. House slops, in which bran of some sort may be mixed are sufficient food, and healthful. The best and safest diet is green food of some sort, grass, apples, or roots. In proof of the virtues of the latter, we have never had a frenzied sow since we began feeding them plenty of roots. When we fed corn alone, such cases were common. Last year ten sows wintered on roots: all had pigs and raised full litters except one, which was injured by leaving her with the others too long, and some of her pigs being dead when born, the others were too weak to endure a cold night. Sows had pigs on freezing nights and every one lived, as they were strong and active. The feed of these sows consisted of all the swedes they would eat and one ear of corn until near the time of pigging, when they got two ears at a feeding, making six ears daily. These sows were not a year old when their first litters of pigs were born, and each one of them had second litters in the fall.

Any hog, and especially a sow in pig, should have, at least three times a week, a small quantity of charcoal. This helps to correct acidity of, and arrests fermentation in, the stomach, which is a source of diarrhea. A little sulphur is excellent and coal ashes with the cinders, are good. Pigs will pick out all the charred bits, and they act as correctives. All of the above are important if not necessary to keep a pig in a healthy condition. The best and handiest plan is to throw a bucketful of coal ashes and charcoal in one corner of the pen and let the pig help itself. The sulphur and salt may also be placed in another spot, and if they will not get wasted by mixing with the litter of the pen, several handfuls may be put in at a time, with no fear that any more will be eaten than is required. No harm will ever come on account of a bountiful supply of sulphur, salt, charcoal, or coal ashes. A small, dry bed is best, as the sow will not cramp herself up so much but lie more extended with less danger of crushing the pigs by getting on them when she moves about in the nest. The little pigs can move around with more freedom.

After pigs are born, the mother should be allowed to lie quiet as long as she will. The diet for the first week should be light so as not to create fever, or stimulate the flow of milk. After the first week the feed should be liberal of bran and corn meal. Barley and oatmeal are the best to make a flow of milk, of anything, except cow's milk. The pen must be kept clean, or the pigs will get scabby and sore. Whenever this is the case they should be washed clean in soap-suds and rubbed all over with melted hog's lard. When pigs are three weeks old they will learn to eat oats, if fed with the mother, and when they are four weeks old they may be taught to go into a pen by themselves where can be fed all they will eat. This food is perfectly healthful for young pigs, and will make them grow very fast. Corn is injurious, except given to them in a small quantity. Sows will sometimes refuse to let the young pigs suck, on account of soreness of the nipples, caused by lying in the mud or in a dirty pen. When this is the case, the sore nipple should be inclosed in a bag fitted to it and tied around the body of the sow. We once cut a nipple off to save a litter of twelve pigs, which were starving because this one was so sore the mother would not suffer the pigs to suck. This is a good way to save trouble, but the best way is to wash the udders before the pigs are born, and keep the sow confined where there will be no occasion for cracks or soreness.

A shield or fender at the side of the pen will save the lives of pigs, especially if the sow is inclined to get up and down frequently. A plank ten inches wide should be placed on one side, horizontal with the floor with the ends resting on supports so as to raise it just high enough for the pigs to slip under, and not high enough for the sow's back to get under. Make this plank fast, as it is a safe refuge for the young pigs, and will prevent their being squeezed between the mother and the side of the pen. Make the nest by this fender. Under all circumstances a sow should have a warm pen.

The Poultry Yard.

A POULTRY ACCOUNT.

IN consequence of the mild and pleasant weather we have enjoyed in this section, during the month of January, and the opportunity thus offered to accomplish a large amount of out-door work, that could not be done in severe cold weather, I have devoted my time to making needed improvements and repairs that had been neglected during the fall for want of time, and consequently I have deferred compiling the annual report of my poultry for the year 1879, until the present date.

I have received a number of inquiries from those who have taken an interest in the previous reports of my "poultry account" that have been published during the last four years in the RURAL, asking of my success or failure the past year. The account herewith published will fully answer all such inquiries. Heretofore I have stated the manner in which I cared for my fowls. There are many people who think it is quite difficult to keep a reliable account of the cost and sales of a lot of poultry. For the benefit of these I will endeavor in this communication to tell the way I keep my account:

Nearly all the feed consumed is bought, usually in half-ton lots, and is put in bins and used exclusively for the fowls. When bought, it is at once charged, and no portion of said feed is used for other stock. All sales of fowls, chickens and eggs are duly entered on a day-book of farm sales. At the end of the year this book is looked over and all sales from the poultry yards classed under their proper heads. Fowls, chickens and eggs used at home are charged at their market values.

During the year a few birds are lost in various ways—by accident, disease and other mishaps. Such losses are not included in the account, and of course their value detracts from my net profit. A portion of the roost droppings is sold; but the largest part is used; those retained are credited at the price obtained for those sold. They are thoroughly pulverized, mixed with loam and plaster, and a large handful is applied to each hill for corn previous to planting. I have been most successful by first dropping the mixture in the hill, covering it with an inch of soil and then planting as usual. Rows that were first planted and on which this compost was then thrown on the hill, did not compare favorably as regards color, rapid growth and yield, with those treated as first named.

There has been some criticism made on the previous yearly reports from this flock of fowls, chiefly from a class of men who have utterly failed to make their own poultry a source of profit, and when they read a minute and full account of what others may have accomplished where they have utterly failed, they are inclined to ridicule what they may think quite impossible.

The writer's experience dates back to a commencement with about thirty fowls kept in a 16x6 ft. house with a solitary window, 2x4 ft., and without ventilation. To this succeeded a gradual increase in numbers and large substantial poultry houses that combine warmth, thorough ventilation and plenty of glass to admit the sunshine. This system of management has fully demonstrated that no stock kept on our farms, can give so large a percentage of profit as a well kept and successfully managed flock of poultry. I present the following account to the readers of the RURAL solely for the practical information I believe it contains, and not for the purpose of "puffing" my own flock of poultry, and in proof thereof I refrain from signing my name:

Jan. 1, 1879. In account with 187 fowls:	Dr.
To 184 fowls @ 60 each	$112.20
" 96 bushels corn @ 50	48.00
" 1½ tons cracked corn @ $21.50	32.25
" 2 " wheat middlings @ $22	44.00
" 10 bushels cull onions @ 20c	2.00
" meat scraps and rough tallow	4.50
Total cost	$242.95
Dec. 31, 1879.	**Cr.**
By 861¾ dozen eggs	$186.25
" 114 fowls sold	81.10
" 194 roosters	76.39
" 215 stock on hand 60 cts	129.00
" 120 bushels roost droppings 35 cts	42.20
Total proceeds	$514 94
Deduct cost	242.95
Profit	$271.99

Walden, N. Y., Feb. 10. RURALIST.

Pekin Ducks.

In reply to F. H. D. in a late number of the RURAL, I would like to make a few statements in regard to the above-named ducks. I have raised them ever since they have been imported, as I have reared all other ducks from the common breed up, and have found the Pekin the most profitable, not regarding fancy prices, as I do not set up for breeding except in my own locality, where they are admired by every one that knows them. I have sold all I can raise, dressed, at 75 cents apiece. Have found them as great an improvement on the smaller breed of ducks as the improved breed of fowls is ahead of the common dunghill.

These are the points in their favor: 1. Their flesh in quality and flavor exceeds that of the common or of any other duck I have tried, and so say my customers. 2. They are very hardy and seem to prefer being out-of-doors the year round, and will do well with only a pan of water to drink out of, but they will keep their plumage in better color and gain half their living by a pond or running stream. 3. They are not gormandizers and do not eat any more than, if as much as, the common duck. 4. When dressed, their feathers excel those of the goose or of any other known duck, but I do not believe in picking any duck alive. (I know some folks who keep the Pekin for their feathers only.) 5. Their eggs are larger than those of any other duck, and they lay as many. Perhaps H. F. D.'s neighbor has let his Pekins run down by not introducing new blood, which can be done by changing drakes once in two or three years.

G. H. O.

Dairy Husbandry.

CREAM FOR GENERAL CONSUMPTION.

O. S. BLISS.

THE following article, written more than six months ago and intended for the Fair number of the RURAL, was recalled and withheld from publication because I was unable to find anywhere an indorser of the three theories in regard to the precipitation of injurious or offensive matter by fill milk; the impossibility of drawing the precipitated matter from under the cream with the milk; and the impossibility of deodorizing milk and cream, except by exposing it in wholly uncovered vessels or condensing the odorous gases and carrying them out in the liquid form. But in the meantime it has been shown in the use of "centrifugal," in which the pressure of the milk on the sides of the drum is 200 pounds to the square inch, while upon the bottom of the ordinary 20-inch can it is, including atmospheric pressure, only about 16 pounds, that in *all* the milk experimented upon, however carefully produced, and, though passed through "four fine metal sieves" before being passed into the machine, more or less "dirty matter," as it is called by one experimenter, or "offensive and greenish slime," as it is called by another, is invariably found on the side of the drum, which corresponds with the bottom of the can or pan in ordinary milk setting. It has also been found by scores of practical dairymen, to their sorrow, too, that the matter precipitated upon the bottoms of the "bottom skimming" apparatus, is drawn with the cream instead of with the milk as claimed. None the less gratifying and positive is the indorsement which the third theory has received. The inevitable conclusion is that both the skim-milk and the cream delivered from the apparatus described, are in better condition—freer from all impurities—than that produced by any other known process, unless it be the "centrifugal," and the most rigid practical tests verify the conclusion.

I therefore return it for publication, not with more confidence in the soundness of the theories advanced, but with less dread of the captious criticism of a certain class of obstructionists.

CREAM for the table or for culinary purposes has always been regarded as a luxury in which only the few might indulge. This, in the past, was due principally to causes which happily no longer exist, and there is no *good* reason why it should not now take the rank due to its intrinsic merit as the most healthful and in every way most valuable article of fatty food. The law of compensations is universal. If there is an over-production of butter and cheese, it is because there is a higher and better use for the product of the dairy. The fearful diseases which prevail among swine and the consumers of hog products, and the almost universal adulteration and counterfeiting of manufactured articles, not excepting lard and butter, all admonish the people to resort to the use of the simple, more healthful and more ennobling fat of cow's cream. The poor starving victims of indigestion, whose sufferings no man who has been so fortunate as to avoid them can appreciate, as they learn the virtues of pure, cold cream, will meet the producers half way, and take all they will send them in a good condition and at a reasonable price. As a food for consumptives it is better than any medicine, and many physicians prefer it to the best cod-liver oil, and for many cases of general debility it is far superior to all tonics and stimulants. It is capable of being made a most powerful agent in the promotion of the cause of temperance and sobriety, and is to-day the most promising hygienic and moral force in the hands of the people.

When my attention was directed, several months ago, to an inquiry into the conditions necessary to a more extended and general use of this very valuable product of American industry, now made economically practicable for the first time by the very large development of the dairy interest, I found a healthful public sentiment upon the subject and many persons everywhere ready and anxious to buy and use cream; but I was met at every point with the questions, "Where shall we find it?" "Do you not know that to procure an article of pure cream in a condition for any other than cooking purposes, is one of the most difficult tasks ever imposed upon city residents?" And again the question was asked "How many of the dairymen of the country produce such cream as is adapted to general consumption in its natural state? Or producing it, can put it up in a condition to go to market?"

I had for several years been devoting much time and study to the determination of the problem of economical cream raising, but I had never given much thought to the quality of cream beyond its butter content and its adaptation to the production of good butter. I had, in common with most of the world, assumed that proper cleanliness and care were all the requirements necessary so far as regards quality. But this inquiry at once led me into an entirely new field of investigation, and I found it a very broad one. Turn which way I might, I met with one or another criticism upon the quality of cream. The limitations of this paper forbid a general discussion of these, and I must pass them with only an allusion to the more important.

Much of the cream which goes to market is still that produced in common, open pans. It has the advantage of being freed from the offensive odors and flavors common to milk and of being rich in fat. It has the disadvantage of being loaded with the elements of decay, and if it does not reach the consumer already sour, and perhaps approaching putridity, it soon becomes so; and is, in fact, from the very first only adapted to kitchen use.

The opposite extreme is the cream produced by the cold process. Much of this comes from

the city milk-men; but not all by any means. Little, if any, of it ranks high as regards its butter content, and I have never seen a sample of it which was not otherwise subject to criticism. One of the largest dealers in cream in one of the largest seaboard cities, states that it is far less satisfactory than the other article to which allusion has been made. There are two principal difficulties with it. It retains all the impurities of the milk which in the open-pan system are thrown off in vapor or left in the form of precipitated matter at the bottom of the pan. It is true that in most of the cold methods an attempt is made to deodorize the milk and cream, but, so far as I know, in no single case is the attempt a success. It is a great error to suppose that mere contact of air with the surface of a vessel of milk, has a purifying influence. Such is not the case. The gaseous odors arise with the vapor of the milk, and if there is a free current of air across the vessel to serve as a vehicle and carry them off, they are removed and diffused into the atmosphere; otherwise they are condensed by contact with the cold air and sides or cover of the vessel and fall back into the milk. The "ventilators" which are usually provided for this class of vessels are good for nothing except to provide for the expansion and contraction of the air within the vessel. Air has both weight and elasticity, hence each layer or stratum of air is heavier than that next above it, and can no more rise out of the "ventilators" provided for the class of vessels alluded to than the milk itself. Deodorization in cooling vessels can be accomplished only by condensing the vapors and conducting the condensations away. The elasticity of the vapor is entirely counteracted as it approaches the cold cover of the vessel, and it has no more power to escape than water, which indeed it is.

The retention of the sedimentary matter, which is effected by most of the cold "creamers," is often a very great evil and much impairs the quality of the cream. Indeed, there is much butter thrown on the market, which is injured in the same way. Almost without exception, this class of vessels are provided with arrangements for drawing the milk from under the cream and afterward drawing or pouring off the cream, upon the erroneous theory that the precipitated matter, of which there is always more or less of a more or less offensive nature, will run away with the first of the milk. This is not true.

Every particle of the sedimentary matter is left in the bottom of the vessel to be drawn with the cream. If it were true, as has often been asserted by the men who sell this kind of apparatus, that the sediment runs out first, the hills which God decreed should stand forever would have long since been washed into the sea.

There is, of course, between these two extremes of quality much cream of most excellent quality made by one or another process, which is mostly supplied to individuals, but in some few cases is put upon the market. But it is an exceptional or special product and cannot materially affect the general market any way. If cream is ever produced, sold and consumed in such quantity as the public welfare demands at the present day, it must be the result of a greatly modified system of production and marketing. In the first place, there must be a fixed standard of quality and the product must be brought to that standard. In the next place, it must be put up in merchantable form and made a strictly commercial commodity.

The sooner city people learn that the very last person to whom they should go for their supply of cream is the city milk-man, the sooner a reformation in the quality of both milk and cream will be inaugurated.

I do not propose to offer a word of apology, and but a few words of explanation, for describing in this connection a process of producing cream which both theoretically and practically meets the requirements of the proposed trade in that commodity. When I began the investigation of the subject of cream raising several years ago, it was with no intention or purpose to develop a new apparatus, but only to develop principles and leave to others the practical application of those principles. Experience has taught me, however, that the public interest is not served by such a course; whether my own is or not, is of less importance. This investigation of the means of promoting a more general consumption of cream, to which I have devoted a large amount of time and labor, would have been incomplete and of little avail unless I had been able to point out a means of meeting the demand which may be made for it. It is of little practical benefit to make a *diagnosis* unless a remedy is also prescribed for the disease.

For the economical production of pure cream of a high and uniform quality by the cold process, for I do not find any other practicable, I construct long, na row pans, vats or troughs of moderate depth, say 12 to 16 inches, and place them in a case the lower half of which is a water tank and the upper half a refrigerator or ice chamber. Over the pans, and reaching down into the water in the tank at their sides, I place a cover so constructed that over each pan is a steep roof, upon the inside of which the vapor rising from the surface of the milk is condensed, by the influence of the ice or water, upon the upper side and carried down into the water outside of the pans. This form of cover to the pans has far more cooling surface than a flat cover and cools the milk much more economically than any other I have used, at the same time that it perfectly condenses the vapors and gases arising from the milk and leaves the cream in a much firmer and richer condition than is possible in any non-condensing apparatus, and entirely relieved of the harmful odors.

Instead of the usual method of drawing the milk from the bottom of the pans, I draw it an inch or two above the bottom; then draw the cream, and finally draw the residue of the milk together with the other matter which I do not want in the cream. The bottom of the pan is constructed with especial reference to gathering the deposits in as narrow a space as practicable. I am thus enabled to produce not only a purer cream than by any other known process, but a purer skimmed milk. It should be added that for many purposes this cream is greatly to be preferred to that which has been produced by the aid of heat, which is often offensive by reason of the scalded-milk flavor.

The best method of putting it up for market which I have met, is to draw it directly from the vat while cold into the Warren fruit glass bottles and carrying cases. In these the temperature can be cheaply and easily kept so low that the quality of the cream will remain unimpaired for weeks together. I can see no good reason why consumers should not be able to order a week's supply at a time from their friends in the country. I can see no good reason why, with refrigerator cars and cold storage, cream may not become an article of merchandise as easily and economically handled and transported as butter. The trade in *pure cold* cream is destined to reach immense proportions.

No Patent Milk Pail.—In the Rural of Jan. 10, was an illustration of Dodge's patent milk pail which is similar to one I have been using for a year or more and on which I believe there is no patent. I use cloth for a strainer instead of those commonly used. The material is such as is used for cheese bandages and is cut in squares of one-fourth of a yard. This can be folded in four thicknesses, put over the spout of the pail, (like the one in the illustration) and held in place by a tin ring fitting closely over the spout and strainer. Such a pail can be made by any tinsmith, and is as cheap as a common milk-pail M. E. M.

Pomological.

SOUVENIR DU CONGRES PEAR.

In the Rural New-Yorker of June 5, 1875, we first gave an illustration of this remarkable pear. For the present illustration of it we express our obligations to Ellwanger & Barry, of Rochester, New York, who have introduced it in this country, and who for several years past have offered it for sale. The pear from which the drawing was made is of natural size, raised in their nurseries during the summer of 1879, and weighed 21½ ounces.

SOUVENIR DU CONGRES PEAR.—FIG. 89.

The tree is a *moderate*, upright grower, very productive. To obtain good standard and dwarf trees Messrs. E. & B. are obliged to double work on vigorous kinds. The fruit grows sometimes singly, but generally in clusters of two and three from the same bud, and hangs firmly to the tree when exposed to the influences which cause other varieties to drop. The specimens, as will be seen by the cut, are large to very large, weighing from one to two pounds and larger than the Bartlett or Clapp's Favorite, to which they bear a strong resemblance. The skin is smooth, bright yellow when the fruit is fully matured, with the parts exposed to the sun brilliant red or carmine. The flesh, while it is very like that of the Bartlett, is free from its strong musky aroma, and it is firm to the core. It commences to ripen about the first of August, before the Bartlett, and extends into September.

This pear originated with M. Morel of Lyon Valre, and by him was dedicated to the Pomological Congress of France, hence its name. Messrs. Ellwanger & Barry think it a great acquisition for this country.

Horticultural.

A ROYAL SUBJECT UNDER DIFFERENT TITLES.

The Cuthbert.

If there was ever a stronger example of "persistent merit" among Raspberries than the Cuthbert, it has never come under my observation; and for this reason, too, it seems destined soon to have titles as numerous as the Czar of Russia during the reign of Alexis Michailovitch. As this multiplicity of names seems likely to create confusion (in fact, such confusion already exists to some extent), I write out these few notes in hopes of suppressing it to some extent by throwing light upon the subject; especially as the whole matter seems highly ludicrous to me.

I noticed recently in the circular of Mr. Chas. A. Green, Clifton, N. Y., now one of the most distinguished authorities on small fruits in the country, mention of a Raspberry called "Lost Rubies" with this description and note. "The Red Raspberry, 'Lost Rubies' was found growing with another variety. We hav submitted the canes and fruit to our most eminent pomologists and they cannot name it. We have fruited it four years and can recommend it as the most profitable berry we have among all the old and new. It is of the largest size, bright red, very firm, perfectly hardy and healthy; a rampant grower, and equals the Philadelphia in productiveness. Our pickers fill their baskets quicker from Lost Rubies than from any other Red Raspberry; and when not watched will often slip away to that patch." This suggestive cognomen and the description so exactly fitted the Cuthbert, and the reference to the pickers so vividly called to my mind the experience I had while superintending a gang of pickers in a patch of some acres of Raspberries, a small portion of which were Cuthberts, in 1868, that they led me to wondering if that might not be the same. I therefore wrote to Mr. Green asking him to name some of the *characteristics* of the Lost Rubies. In his reply I read "Lost Rubies entirely distinct from the Cuthbert sent me by ——— ———. The pieces of cane sent are all from one cane —the bluish bloom about the base of the cane is ever present." [That sounds like Cuthbert! I mentally ejaculated.] "I give no protection. The canes stand often six feet high." [Still Cuthbert!] "Do you know of any variety whose canes are like them?" [I do not.] "How about the Cuthbert being the Conover, and how has it been kept so long silent?" The next mail brought the canes. There they were—Cuthberts in every particular to the minutest—in spines, in growth, in form, color and arrangement of buds, in color of bark, in pith, in every perceptible thing. I went out and cut a cane of Cuthbert at random, cut it in pieces and then called in my foreman and others to separate them. No one could tell "t'other from which." I wrote Mr. Green again, sending him a cane of Cuthbert. His response was; "You have provided a key that unlocks a mystery—Lost Rubies and Cuthbert are the same. I can trace the pedigree. I have hunted far and wide for a name. Charles Downing could not name it, nor friend Purdy. Your cut of the Cuthbert faithfully portrays Lost Rubies."

Mr. Green in his first letter asks, "How has it been kept so long silent?" The Cuthbert originated with the late Thos. Cuthbert, Esq., Riverdale-on-Hudson (now a part of New York City) many years ago—twelve or fifteen at the least, and has since been subject to any amount of "wholesome neglect." As Dr. Thurber says of one of our popular Strawberries, "it persisted in speaking for itself," until it was fortunate enough to secure the audience of the worthy Editor of the Rural and now, since *he* has spoken for it, it would seem that others cannot say enough. Perhaps the Cuthbert has faults; but they remain yet to be developed. We now have it appearing east of its home as the "Conover," south of it as the "Queen of the Market," west of it as the "Lost Rubies," and I shall not be at all surprised to find it soon appearing north of it under the appellation of "Prince Imperial," or another like appropriate title. In conclusion I would add that last spring I thought both Conover and Queen of the Market were identical from the appearance of the plants of them. Cuthbert is so decidedly distinct from other Raspberries that I have had, not only conclusive evidence during last summer and autumn as to their identity, but have traced both to the garden of Thos. Cuthbert, to my entire satisfaction. J. T. Lovett.

Little Silver, N. J.

HARDINESS OF RASPBERRIES.

We have been making an inspection of our raspberry fields, to judge of the hardiness of

the different varieties growing side by side without protection of any kind, and as it may be of interest to some RURAL readers we send a short report:

Herstine, Francouia, Brinckle's Orange, and Pride of the Hudson killed to the ground. Mammoth Cluster, Gregg, Philadelphia, Brandywine, Reliance, Early Prolific and New Rochelle are all badly damaged. Doolittle and Henrietta slightly damaged at the tips, while Turner, Cuthbert and Caroline are all alive even to the tips of the very smallest canes. This is about the same as last year, except that the Gregg and Brandywine were not injured. In fact, this is the first winter that Brandywine has ever been damaged; but now many of the canes are dead half way to the ground and it causes us much regret, for until the advent of the Cuthbert, it was our most profitable market variety. Turner has never winter-killed with us, and on this account we consider it very valuable, as it is very productive, of good color, very rich and sweet, although not as firm as the Brandywine.

From our own experience in the past, and from what we can learn from others, we believe that the Cuthbert, while it may not be perfectly hardy in all sections, is more nearly so than any variety in cultivation, except the Turner, and this, combined with its large size, good quality, bright color and great firmness will make it the most popular Red Raspberry in cultivation. We intend to make a large plantation of them the coming spring. Caroline we think has not received the praise it fully merits. It is a hybrid between Brinckle's Orange and Catawissa. The plant is strong, vigorous and very productive and the fruit so closely resembles Brinckle's Orange that it would require an expert to distinguish them. With such valuable qualities as the above, combined with its extreme hardiness, we consider it one of the most valuable for home use, and if we were compelled to plant but one variety it would be Caroline. G. H. & J. H. HALE.

South Glastonbury, Conn., Feb. 27.

Farm Economy.

A COUPLE OF MOLE TRAPS.

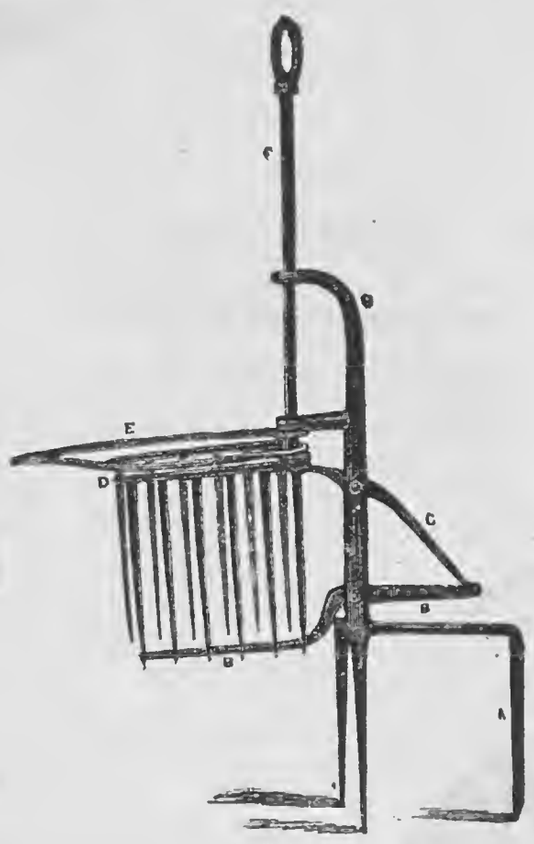
WE here present to the notice of our readers a couple of mole traps, one of which, fig. 90, was described and pictured in a larger cut in the RURAL of July 28, 1877, and the other of which, fig. 91, has been just patented by L. M. Craun, of Burgoon, Ohio. Although they differ considerably in shape, the principles on which both act seem to us identical. The following is a condensed account of the *modus operandi* of the RURAL's trap, as published in the above-mentioned issue:—

The spikes (A), three-quarters of an inch wide and tapering somewhat at the end, are pressed into the ground beside the mole-track as far as possible, so that the trigger (B) which is not yet attached to the lever (C), rests upon the surface of the mole-track, the prong-head (D) meantime being held in its present position by the ring at the top of the upright square bar (F). Now let it slip from the hand. The force of the spring (E) will drive the prongs (D) into the ground, perhaps half way. Press them entirely down with the foot, and raise and lower them several times so as to give firmness to the earth and a free passage to the prongs. Then raise up the prong-head to its present position and place the lever (C) in one of the notches of the trigger (B) according as the other end of the latter is more or less depressed. Now the mole cannot again pass through this track without so pressing upon the earth as to move the trigger (at B), which releases the lever (C) and permits the spring (E) to act, sending the prong-head into its place with great force, securely pinning (generally killing) the mole.

The following are the directions for setting the other trap:

Find a place where the mole passes frequently; press down a few inches of his furrow with the foot—not too closely, but about even with the surface of the ground. Place the trap on one side of the furrow, and at right angles to it, so that the row of spears shall come directly over the mole's path. Place a small stick or handful of dirt under the trap directly beneath the upright post. Next pass the spears into the ground with the trap closed; then raise the spears, and lower the piece through which the spears must pass, and the trap is set. See that there are no sticks or stones to hinder the free passage of the spears into the ground. If the ground is wet, or covered with tough sod, place a weight upon the top of the trap, just above the lower cleat, and let it be of sufficient heft to drive the spears down their entire length. A slight weight, as one or two bricks, should be placed on it even in loose soil.

As this device is patented, to give detailed directions for making one, might expose some infringer of the patent to annoyance and possible loss, unless its validity is tested and upset. The cut, however, leaves little difficulty on this point. When the flap, b, is raised by the passing mole, it lifts the rod, F, which "upsets" a small beveled, wooden knuckle or protuberance at I, on which the top, C N, rests.



THE RURAL'S MOLE TRAP.—FIG. 90.

This being weighted, in its descent forces the prongs r—made of stout wire—through the openings in b into the animal.

Field Crops.

SPRING WHEAT.

A. M. VAN AUKEN.

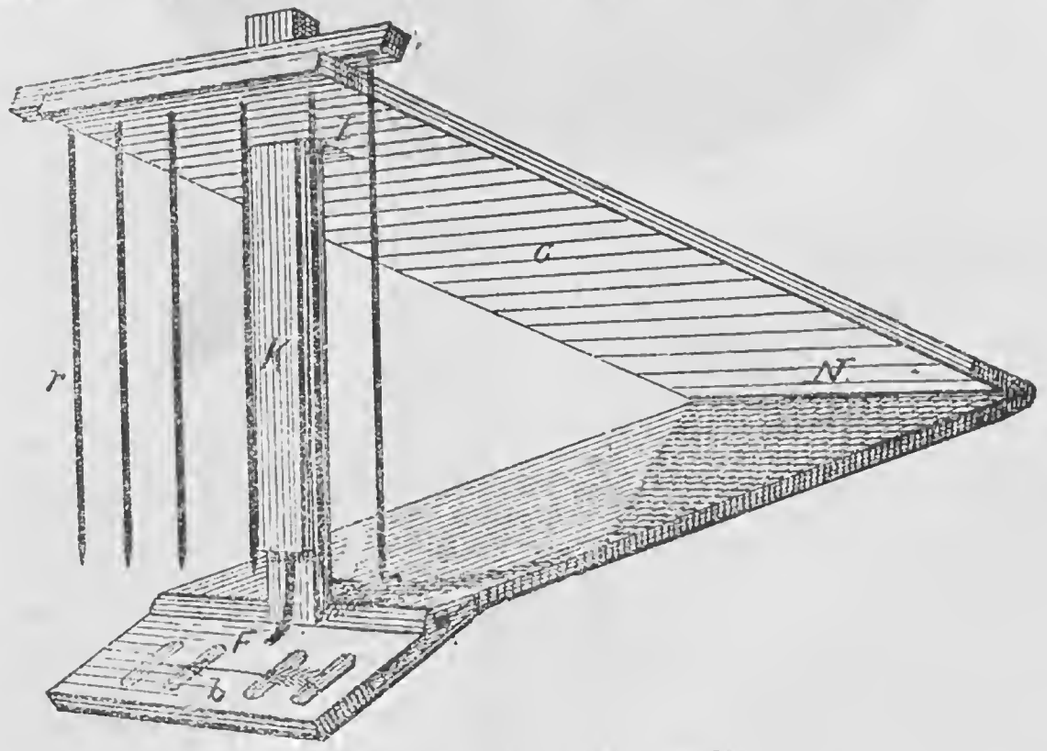
Selecting Seed.

THE seed ought really to be selected in the fall. The best way I know of is to take the wheat from the best part of the field and whip the sheaves over a barrel getting out the ripest grains. The sheaves may then be put up with the rest and thrashed with them. This is "puttering" work and will not likely be attended to in the busy harvest season.

The next best way is to leave a load of the very best until the last; put it on the top so as to be within easy reach, and thrash with a flail before the general thrashing by the machine. That thrashed by the machine is often split and broken. If you have not hitherto selected your seed I would advise that, some day when the wind draws strongly through the barn, the doors should be opened on the ground floor and with a common scoop throw the wheat in a semi-circle *against* the wind. Select that on the outside of your circle as your seed wheat.

Brining Seed Wheat.

I have always been content to sow my wheat dry; but, as it is often recommended to brine wheat, I will give the formula of a successful farmer in an adjoining county: "Procure two barrels, two corn baskets, a wash-tub, a large dipper, and a half bushel measure; also plenty of salt and an ounce of blue vitriol to each bushel. Place the tub in a convenient place with a barrel on either side of it. Make four to six pailfuls of strong brine in each barrel, with two ounces of pulverized vitriol to the pailful. Fill the tub with brine, leaving room for half a bushel of wheat. Commence washing by pouring one-half bushel of wheat into the tub near the side, in a small stream, so as to prevent the wheat carrying the lighter stuff to the bottom. Stir and skim till it is perfectly clean, putting the skimmings into the basket placed on the right-hand barrel. Then empty the cleaned grain into the basket on the left-hand barrel where it may drain until another washing is ready, when it must be thrown in a pile on the floor. Keep an account of the bushels washed, measure the refuse and you can guage your swelled wheat so as to sow the right amount per acre."



L. M. CRAUN'S MOLE TRAP.—FIG. 91.

Preparing Soil.

For full information on this subject read article by "A Jersey Farmer" in the RURAL for Aug. 31st, 1878, also the one by W. J. Fowler in same paper for Sept. 7th. I will say, in brief; plow in the fall; get one or two inches of fine soil and let the ground be hard below that. In your rotation plow deep for your corn and oats, but have courage and plow shallow for your wheat, two inches will give you good results. W. J. Jennings, an excellent farmer and a member of a Fond du Lac County farmers' Club, tells of the effects of trying the thorough-cultivation theory. He had a piece of land that seemed pretty hard; it had been plowed in the fall. In the spring he plowed about an acre, plowed it deep, made it soft and fine. He sowed it all on the same day. The yield on the piece twice plowed was about half that on the rest of the piece.

How much Seed?

Then, make the soil fine and smooth, on the surface by repeated harrowings before sowing. Get it as level as possible before sowing the seed. Then sow your seed thinly. On moderately rich soils I believe one bushel per acre is sufficient. Poorer soils need more seed; richer need less. A well developed head of wheat contains forty grains; I have counted sixty-eight in one head. If we sow one bushel per acre and each grain produces one head—if it grows it can't do less—we shall have forty bushels per acre. I have seen the statement that one bushel of wheat per acre would give one seed to every three inches square of surface. [It has been calculated that a bushel of wheat averages 556,290 kernels, and as an acre contains 43,560 square feet, if the former be divided by the latter, the quotient will give 12 grains to each square foot, or a little over one grain to every 12 square inches instead of one grain to every nine square inches as here stated.—EDS.] That is thick enough for any one. In regard to

Manuring.

I would rather use my manure on some other crop in the rotation, with the exception of plaster and salt. When wheat fails, generally it is not because the land is poor but because the plant food in it is not sufficiently available for the crop. A neighbor had a crop of wheat last year which looked fine until heading out time, but which yielded only four bushels of stuff (not wheat) per acre. In my opinion an application of plaster would have given him a fair crop. One of the best farmers in the State raised the average of his farm from seven bushels in 1866 to 33 bushels in 1877. This was on a crop of about one hundred acres annually. He attributes his success to plaster and clover. His best results are on clover sod, sowing, at the time of sowing wheat, clover and about 100 pounds of plaster per acre. One year his crop, put in in that way, was 27 bushels per acre. On the same ground a part which was plastered in June yielded 15 bushels per acre. The weight of the former was 57 pounds to the bushel, and of the latter 54 pounds. His rotation is, a clover sod, plowed after the second crop is cut; wheat with clover and plaster sown with it; two crops of clover, one for hay and the second for seed or hay as may be, and it is turned under again and is ready for wheat. He believes that Fife wheat grown on a clover sod for a number of years, can be so invigorated so as to beat any Minnesota wheat for "Patent flour."

Time and Mode of Sowing.

Sow as early as possible. If you have two inches of dry soil and frost below it in March sow your wheat. Don't sow when the ground is too wet. It is the rule to sow wheat with the expectation of a good crop, until the wild Plums blossom. As a rule the earlier wheat is sown the better will be the crop. One of our dreaded enemies is the rust, and two of the most frequent causes are, first, sowing so late that it does not ripen before cold nights come on; and second, the use of rank manures.

As I have said before, make your ground as level as possible. As to the manner of sowing, whether by hand or machine, each must decide for himself, only don't cross-harrow after the seed is sown. Do all your harrowing one way, for cross-harrowing invariably uncovers more than it covers up. Three harrowings are enough, and little enough.

Brown Co., Wis.

THE COW PEA IN ALABAMA.

A FEW words about the different varieties of the Cow Pea.

THE RED AND BLACK yield the most vine and leaf, and are running varieties. They will cover the ground and corn, and are very prolific. The seed remains in the ground all the winter and comes up in the spring.

WHIP-POOR-WILL is a bunch pea, very productive, a good table pea, yields ample vine and leaf.

BLACK EYE AND YELLOW EYE are productive in pods and vine—good table peas.

CROWDER is a large white pea, and grows so compact in pods that they are as square as dice; very prolific of vine and fruit.

THE LADY PEA is a small, yellow-eyed pea, immensely productive, and full of vine and leaves. None of the above should be planted except when the weather is warm. They may, as is our custom, be planted between the corn at the last plowing—four or five peas in a hill, either in the middle of the row or near the corn. Before the corn is ripe they will cover the ground and corn with a dense mass of vine, leaf and pods.

The best way to plant them is in drills three feet apart; the peas scattered thinly in the drill, say four or five inches apart or much thicker. As a fertilizer we have nothing that can compare with Cow-peas. They will grow and luxuriate in the poorest soil and completely cover the ground with a dense mass of vine and pods from one to two or three feet thick. In order to plow them in, a turning plow must be used, with a heavy chain attached to the double-tree or a sharp circular coulter. Wheat may then be sown and will produce on the poorest land 10 bushels to the acre. We generally give the vines a thick coat of lime before turning over; sometimes we use stone lime reduced to powder or slaked by strong brine. They form a fertilizer of great power for all plants—in fact, in conjunction with humus, the best I have ever used.

The Cow-pea makes the most delicate and juiciest beef, pork and mutton; increases the flow of rich milk, and gives golden, fragrant butter. The flavor of beef, pork and mutton, imparted by the pea, is entirely different from that of the meat of stock fed on any other food. The hulls of the peas, after thrashing, are greedily eaten by all stock. This pea is the most easily grown, most prolific, and best stock food. One bushel to the acre for broadcasting as a fertilizer is the right quantity. They sell here now at $1 per bushel. They are so plentiful in our land that even our people do not estimate them properly. As the produce is so bountiful they do not take time to gather all the crop, as they deem cotton picking more important. GEO. D. NORRIS.

Madison Co.

Miscellaneous.

WHAT OTHERS SAY.

DIRECTIONS FOR APPLYING CONCENTRATED FERTILIZERS.—[Just at this season more than any other, our readers who desire to experiment with concentrated fertilizers will find the following directions, as given by Professor G. C. Caldwell, of value. These were read before the recent meeting of the Western New York Hort. Society.—EDS.]

First.—Have unmanured plots of the same kind as those manured, and bearing the same kind of crop, so as to have some means of estimating the effect of the fertilizer experimented with.

Second.—Do not experiment with complex mixtures containing all of the three important constituents of manures—nitrogen, phosphoric acid and potash—*unless* other experiments are also tried with manures containing each one of these alone or containing two of them together, for possibly any one of them alone may make as much of a crop as all three together; and if the experiment is not so arranged as to test this possibility, we have no assurance that all three are required for a given good result.

Third—For *phosphoric acid* use a *plain*

superphosphate *i. e.*, one containing no nitrogen for *potash*, either wood ashes, unleached, or muriate of potash obtained from dealers in fertilizers; for *nitrogen*, use either sulphate of ammonia or nitrate of soda; the last-mentioned manure should be used only as a top-dressing for a growing crop. For a mixture of phosphoric acid and nitrogen, an ordinary superphosphate containing both may be used, or fine bone meal, or *rectified* Peruvian guano.

Fourth.—As to the quantities to be applied: of *phosphate*, 300 to 500 pounds to the acre; of sodium nitrate, 100 to 200 pounds; of ammonium sulphate, 100 to 200 pounds; of muriate of potash, 150 to 200 pounds; of bone meal, 400 to 500 pounds; of rectified guano, 300 to 400 pounds; of stable manure, 14 tons.

Fifth—When different fertilizers are to be mixed, be sure that the mixture is completely made.

Sixth—Apply all fertilizers that are to go on one crop on the same day, and let the entire treatment of any series of plots that make one experiment be as nearly alike as possible throughout the season.

Seventh—Commercial fertilizers or stable manure may be applied to either fruits or vegetables. In the case of small fruits or vegetables the manure should be applied broadcast and thoroughly cultivated into the soil.

Of the small fruits, the Strawberry will be one of the best to experiment with. Apple, pear, peach and other fruit trees may also receive applications over the whole ground, or the fertilizer may be applied immediately around the trees and over an area somewhat greater than the spread of the branches.

Soiling Poultry.—A writer in an exchange calls attention to this subject, and gives the following account of his experience:—"The soiling of dairy cows has come to be regarded as the true economical method of keeping them where a small amount of land is available, and the greatest production of milk possible is desired. The same principle, we think, is applicable to the keeping of poultry. In keeping a large flock of hens the manner of feeding them so as to make them profitable is an important consideration. Noticing some time ago that my flock of hens, when let out, made directly for a clover patch, we conceived the plan of soiling them on clover, and each day cut a good armful, placing it in their premises. To our gratification we found that each day every leaf was eaten, leaving nothing but the coarse stems. Bearing in mind the fact that clover contains a large amount of egg-making material, we were not surprised to notice an increase in quantity, size and quality of eggs. Our flock when offered corn, buckwheat, wheat screenings and clover, always preferred the clover. From our little experiment we conclude that one-fourth of an acre of moist ground made rich and sown to clover would yield sufficient food, with two quarts of mixed grain daily, to keep in good healthy working condition a flock of 100 hens during the summer season. We believe clover a cheaper and richer feeding material for poultry than any we have known suggested."—We find the above in the London Agricultural Gazette.

Ultimate Value of Land in the Cotton Belt.—"B. F. J." expresses the opinion, in Home and Farm, that, as successful cotton growing is very largely and purely a matter of climate; all or nearly all of the lands—good lands, bad lands, old lands and new lands—in the cotton belt proper, will sooner or later become valuable even in excess of the value of those lands which are now esteemed so much for wheat.

The New North Land.—In another part of Home and Farm, the same thoughtful writer says: Roughly described, the new country (mostly within the limits of the British province of Manitoba) lies around and north of Lake Winnepeg, and extends to and around Hudson Bay. Its southern boundary is the line dividing the State of Dakota from the British possessions of North America on the 49th parallel. Within that entire region winter never fails to put in an early appearance, accompanied with low temperature and an assured fall of snow, seldom accumulating to a great depth, but lasting from early in November to late in April. And it is from this climatic fact and circumstance that many who have given attention to the subject are prepared to admit that, sooner or later, this new north land, which in extent is equal to three or four of the prairie States, will grow into a great State so populous, productive and wealthy as to astonish the world. Given a soil of a capacity for the production of wheat, a summer climate capable of maturing it, and a snowfall which covers the fields with a protecting blanket from November to April, and there are secured the three essential elements of successful and profitable wheat growing, which, when within reach and on a scale sufficiently large, will produce this great cereal so certainly and so cheaply as to practically monopolize the markets of the world. Though the event now looks remote, and the gratuitous opinion may appear a hazardous one, nevertheless we shall venture to put ourselves upon the record with the prediction that, within a quarter of a century, and perhaps within the next ten years, the farmers of the middle winter wheat region, lying between 35 degrees and 40 degrees north latitude, will find their strongest competitors in the markets of the world to be not in California, not in Minnesota, Dakota, Kansas or Nebraska, but in the new north land about Hudson Bay. The facts and the outcome of the last few crops clearly demonstrate that spring wheat growing in the Western and Northwestern States is extremely hazardous business even on a fresh soil; and in much of this territory winter wheat growing is still more so, because there is no assured and permanent snowfall and the ground freezes dry in February.

book for the farmer, stockman and horse-owner, giving plain practical terms, descriptions, symptoms and remedies for all diseases of the horse, ox, sheep, swine and dogs by Jno. Johnson, United States Vet. Ed. of the Ohio Farmer and Practical Farmer. A little work of 130 pages published by the Ohio Farmer Co., Cleveland Ohio.

THE S. R. NYE BAY ST TE RAKE.—EIG. 92.

CATALOGUES, ETC., RECEIVED.

Note.—Readers are referred to our advertising columns for any particulars omitted in the following necessarily brief notices:

Kissena Nurseries, Flushing, L. I, New York. Parsons & Sons, Proprietors. Catalogue for 1880 of ornamental trees, plants, fruit trees, &c. Also a list of new and rare plants. The gentlemen of this establishment are well known to our readers—indeed to the horticultural world everywhere. In the introduction of our new and rare plants—especially of hardy ones—they have for years, in the face of many discouragements and at a heavy expense, worked with never-tiring perseverance and energy. The catalogues now referred to show the results of their labors. Not less than 350 really new and rare plants are named and briefly described. Important additions have been made to the Japan Maples. For the rest, there are so many plants of peculiar merits, that our readers must examine the lists for themselves.

John Saul, Washington D. C. Catalogue No. 6, descriptive of new, rare and beautiful plants—Crotons, Dracænas and other foliage plants; Fuchsias, Carnations, Verbenas, Phloxes, Geraniums, Gladioli, &c., &c. Catalogue of 118 pages.

Also Catalogue No. 5, descriptive of a select list of Roses, 15 pages.

A. C. Kendall (Late Stair & Kendall and B. H. Stair & Co.,) 115 Ontario St, Cleveland, Ohio. Business established in 1839 Catalogue (free to all applicants) of field, garden and flower seeds, agricultural implements, etc.

Third Annual Report of the N. Y. State Dairymen's Association, with transactions and addresses for the year 1879. Contents: Articles of Association; List of Officers; List of Members; Proceedings—Opening Address; President's Address; Commercial Aspects of the Dairy—Fred I. Evans; A Glimpse at Dairy Husbandry in West Friesland—S. Hoxie; Butter—John S. Shattuck; The Jersey as a Dairy Cow—M. S. Wilcox; The Dairy Interest Prof. L. B. Arnold; Mixed Farming in Dairy Districts—Hon. S. F. Miller; Feed and Care of Dairy Stock—Hon. Harris Lewis; The Unknown of the Dairy—E. S. Munson,

---

The Michigan State Pomological Society is about to issue the second edition of its Fruit Catalogue, revised and improved. The first edition was issued free to all applicants and found a large demand. This year we shall ask applicants to remit a small amount to cover the cost of printing and postage. The work of compilation is a free gift to Michigan Horticulture. Any one desirous of obtaining the catalogue can have it sent post paid by inclosing in a letter to me, the address and five three-cent stamps. C. W. Garfield.
Grand Rapids, Mich.

The Homœpathic Veterinarian, a hand-

Quarterly Report of the Chief of the Bureau of Statistics, relative to imports, exports, immigration and navigation, for the three months ending Sept. 30, '79.

Geo. S. Josselyn, Fredonia, N. Y., Descriptive Catalogue of High-Class Poultry. All sorts of eggs of thoroughbreds—also, Light Brahmas, Cochins, Plymouth Rocks, Houdans, Leghorns, Ducks, &c. Free.

Bowker Fertilizing Co., 3 Park Place, N. Y.—A treatise upon the Stockbridge Manures and Bowker's Phosphates. We should like to have our readers send for this treatise. It will be sent without charge, and all may thus have an opportunity of gleaning particulars and of informing themselves as to the use of concentrated fertilizers, by the tests and records of practical farmers therein presented. The questions of "whether it *pays*" to use these fertilizers, and "how best to use them on all sorts of crops," are explained in a very plain manner.

The Thomas Smoothing Harrow; The Thomas Harrow Co., Geneva, N. Y. This is an illustrated pamphlet fully describing the above well-known implement. Among the claims made in its behalf are: its thorough pulverizing capabilities which, it is insisted, are double those of any other harrow; the successful cultivation of corn until a foot high at half the usual expense, killing all the weeds in the hill and largely increasing the yield. It is also claimed that wheat thoroughly harrowed in the spring, will produce five bushels more per acre, and that clover seed harrowed in at the same time, will not fail to "catch." There is a large amount of useful matter in the pamphlet, which is sent free to applicants.

Descriptive and Illustrated Catalogue of Patent Plantation Machinery manufactured by Geo. L. Squire & Bro., Buffalo, N. Y. This handsomely gotten up catalogue contains numerous cuts and full descriptions of coffee hullers, separators and polishers, sugar mills for animal, steam and water power, evaporators, kettles, centrifugals, juice pumps, horse powers, steam engines, water wheels, corn mills, tortilla mills, etc., all made by this old-established firm, which has deservedly won a high reputation wherever their goods have been introduced.

Illustrated Catalogue of Sulky and Revolving Hay Rakes and Portable Engines manufactured by J. H. Thomas & Sons, Springfield, Ohio. Intending purchasers of either hay rakes or portable engines should certainly write for this catalogue—which is furnished gratis to applicants—before deciding which to buy; for the fame of the Thomas rakes and engines is national—nay world-wide.

J. H. Johnson, Great Western Gun Works No. 169 Smithfield St. Pittsburgh, Pa., Illustrated price-list and catalogue of guns, rifles, revolvers, ammunition and sporting goods of all sorts.

Industrial Implements.

THE S. R. NYE BAY STATE RAKE.

Among the excellent rakes that will claim the farmer's attention next season, the S. R. Nye Improved Bay State Rake has many merits that bespeak favorable notice. It is made by the Belcher and Taylor Manufacturing Company of Chicopee Falls, Mass., a firm long and favorably known to the readers of the Rural. It is constructed of the best material and in the most workmanlike manner so as thoroughly to realize the inventor's design—a perfect rake. Among its improvements are:—bent and heavier shafts, and a new seat standard adjustable to a driver of any size. Moreover, the rake is much stronger than heretofore and therefore less liable to need repairs, every part having been strengthened where experience hinted at a weakness, and malleable or wrought iron having been used wherever there was a possibility of breakage. The peculiar shape of the teeth prevents them from scratching the ground, so that the hay is undefiled with dust, and the position of the teeth at the ends of the rake in advance of those in the center, prevents the hay from scattering or "roping out"—a point of particular advantage when raking on a side-hill or gleaning. The manner in which the teeth are held in their proper position laterally—by what is called the *guide*—prevents them from flopping about. We also notice that each tooth acts independently of all the others, so that it can pass over an obstruction 20 inches high, without affecting in the least teeth alongside of it, thus ennabling it to rake clean on rough or uneven ground. As it is dumped almost entirely by the power of the horse, a pressure of only a couple of pounds by the foot, is needed. Circulars describing several other recent improvements and containing testimonials as to the great efficiency of this rake will be promptly sent to all applicants. As the rake received the first medal at the field trials at our Centennial Exhibition, and the large silver medal and diploma at the Paris exposition of 1878, besides several other honorable awards elsewhere, we certainly think its merits should be carefully investigated by all who need such an implement.

The New Blanchard Churn.

What farmer or dairyman has not used or favorably heard of the Blanchard Churn during the last quarter of a century? But, popular as the old form has been for the last 25 years, the recent improvements are sure to increase that popularity. The other day, while noticing the fine display of dairy implements at the International Fair in this city, we felt impelled to pay special attention to this device, and the award of first premium to it since then has confirmed the favorable impression we formed of it. How often, after the introduction of some new invention or of some improvement on an old one, is the thing so evidently beneficial that there is a very natural surprise that it had not been hit upon sooner. Yet it often happens that these apparently simple successes are the results of no small amount of thought, labor and ingenuity. It is the story of Columbus and the egg repeated. The thing is ever so easy and obvious after it has once been done. So with the chief improvement in the new Blanchard. This consists of a better form of the body of the churn. Instead of the flat top of the old farmers' favorite, the top as well as the bottom of the improved article, is made circular. By this seemingly inevitable improvement all the cream must be churned alike, and at the same time, while there is no longer any need for scraping down the cream from the top and sides of the churn, and the making of streaked butter is rendered impossible. Moreover, the new form is stronger and more durable than the old. The body of the churn is made of matched staves from the best Michigan pine. The new dasher, too, being simpler than the old, less power is needed to turn it.

A Useful Device.—During the past three years we have had many occasions to test different inventions and devices, upon the Rural Farm; and it has always given us much pleasure to acquaint our readers with the results of those experiments. And perhaps of none can we speak in more praiseworthy terms, than of the usefulness of the Ingall's Patent Link, a device so simple and practical that its merits are obvious for making and repairing chains without the aid of any tool, and adjustable at once. These links can be used in any place where strength, durability and simplicity are required, and save the farmer, the contractor, the steamboat and vessel owner, many trips to the blacksmith's shop. It also takes the place of belts in transmitting power, and is absolutely safe as it never unhooks when in use, and is made of the very best material. The patentee claims a superiority over all other devices of the kind. Ask your hardware dealers for them or address, Ingall's Manuf'g. Co., Providence, R. I.

At a Trial of binders near Dunedin, Otago, New Zealand, February 10, the improved Walter A. Wood binder, was awarded 1st prize over seven machines in competition. As this is the first trial of the season reported, we are glad to give it publicity.

The Right Speedy Corn-Sheller, made by Curtis Goddard, Alliance, Ohio, is a convenient little thing for shelling small quantities of corn.

Everywhere.

TO AIKEN.

Within a few miles of Philadelphia on the Penn. R. R., the passenger may count a hundred, perhaps several hundreds of barns and other farm buildings with the sides fronting the road, painted black with white-lettered signs announcing Pectorals, Pills, Bitters and other so-called quack medicines. The travel over such central lines is very great and the advertisements are conspicuous certainly—so much so, in fact, that it is a task to look out of the windows and keep the eyes off them. One finds himself, after having passed through this country of barn advertisements, repeating "Smith's Porous Plasters," "Brown's Instantaneous Pain-killer," etc., much as one sometimes finds himself mentally humming some familiar tune that he would gladly banish from his thoughts. Of course, it is not pleasant to have one's outbuildings turned into immense advertising placards. But if the advertisers pay for the space in anything like the proportion charged by newspapers, such signs must very soon pay not only for the barns but for the entire farms.

South of Washington, or perhaps I might better say, Richmond, the railroad to Aiken passes through a country remarkable mainly for its poverty. One involuntarily asks himself: "Why is this desolate country inhabited at all?" It seemed as if the owners had fled from it and that a few poor laborers had been left to live as best they might upon the land or to starve to death. Occasionally I saw a poor old mule (it seemed to be the same one always) with head nearly to the ground, drawing a plow at the apparent rate of one mile per hour. Sometimes big-headed, gaunt-bodied pigs were to be seen meandering through the pine woods or barren-looking fields as if waiting for something to turn up—or to die; they looked to be indifferent. Thus over an immense area of country a startling picture is presented of a desolation which it would be hard to describe.

Aiken.

If this were not a health resort, it would not be anything. The city consists of one short street of stores, a few respectable dwellings—for the most part private boarding-houses—and a substantial hotel capable of accommodating 350 people. Strange to say, in the grounds about this hotel, excepting a few "Pride of India" trees (Melia Azedarach), there are neither trees nor shrubs; neither flowers nor lawns. There is no grass. Oats are sown in the fall and now cover the ground with a foot of fresh, green leaves. After the crop has been harvested, nothing remains but the oat stubble through the summer during which term the hotel is closed. The thermometer during the several days of my visit here (March 4th) has averaged over 70°. The air is dry and balmy and we sit out on the piazza during the evenings until bed-time, usually without an overcoat. Green peas are in blossom, potato vines a foot high. Plum, peach and apple trees are in blossom. Verbenas bloom throughout the winter. Bananas left in the open ground, are now putting forth leaves. Roses are blooming in abundance. Grape-vines are starting into leaf. Still the general appearance of the fields and woods is much like that of winter.

March 8. MAJOR.

RURAL SPECIAL REPORTS.

Ga., Washington, Wilkes Co., March 7.—This has been the mildest winter here within the recollection of the oldest inhabitant. I have in my garden radishes and lettuces large enough to be cut, and some ripe Wilson strawberries. Spring turnips are making fine headway. Peaches and Plums are in bloom, and some trees in the woods are full of young leaves. The wheat and oat crops are looking fine and are in an advanced condition for the season. A good many farmers have planted their upland corn, and are rapidly preparing for King Cotton. J. C. D.

Ind., Roanoke, Huntington Co., March 5—We have had a *soft* winter so far, mud and rain have made the roads almost impassable. The condition of live stock is from fair to middling. Wheat is worth $1.25@$1.30; corn 40c; oats, 35c; clover seed, $3.60@$3.75; timothy, $1.75@$2.00; flour, $7; bran, $14; potatoes, 60c; eggs, 10c; butter, 15c; chickens, 4c per pound; hogs, $3.50@$3.80. A. C. H.

Iowa, Cass Co., March 6.—For the past two months the weather has been delightful. Fall wheat has been hurt somewhat by the open winter. The prospect for fine crops of fruit of all sorts never was better. In 1878-9, however, our fruit was nearly killed as late as May 1st. Last year corn here was an average crop; wheat half a crop. Corn now sells for 25c; wheat, $1; potatoes, 40c. T. H. H. B.

Kansas, Parkersville, Morris Co., March 4.—Wheat looks fine and is as green as in April. Some spring wheat has been sown. The prospects are still good for a large crop of fruit the coming season. The changeable weather we have been having has produced a great deal of sickness. But the most prevalent disease is measles accompanied with a very bad cough. Buyers have bought and shipped all the hogs out of the country and our merchants are now sending to Kansas City for bacon. Hogs and beef cattle bring good prices now. Wheat is worth 90c to $1.05; corn, 23c; oats, 25c, and potatoes $1.00 per bushel. There are two fair Associations in this county, and each holds an exhibition every fall. As most other fairs, they give the largest premiums to men who run and trot horses. The premiums offered for farm produce are so small that no farmer takes any thing to the fair unless he takes pride in doing so; for the premium he gets does not pay for the trouble of getting produce ready; but the premiums offered for races are quite attractive. J. E. R.

Kansas, Larned, Pawnee Co., March 4.—We are having a dry, open winter. Wheat looks very well. The outlook for it is as good as it was four years ago. Some of the early pieces are being hurt by the dry weather. All of the late-sown is stooling out nicely. We have had only one little shower of rain since the 12th of November, and only about four inches of snow. The corn crop last year was a failure, owing to the worm eating it up after it was grown. Rice-Corn was a good crop, and our farmers have learned that they can raise big crops of it even with but little rain. The larger portion of the crop was planted after crops of broom corn or sorghum, and therefore was mixed a good deal, as it readily "mixes." We raise both red and white. Several parties raised crops of the white that thrashed over 40 bushels per acre. Two to three seeds were planted to the hill, and there were from five to seven heads. The sucker heads were smaller. I had a small piece of ground that was plowed June 30, and planted July 1 and 5; the crop matured and was ready to feed the hogs by Sept. 26, as it was then in the dough. For a fodder crop nothing beats it, as one half bushel sown per acre will yield from five to seven tons of choice fodder, and the stock eat up all the stalk except a small piece of the butt end. We have organized a sorgo-sugar factory in this county, and it is meeting with a big success among the farmers, as the cane is a sure crop and will grow even if the weather is dry. S. S. D.

Ky., Milton, Trimble Co., March 6.—Contrary to the predictions of Tice, Ventor, B. F. J. and others, that we would have a cold winter to match that of '78-9, as "seasons went in pairs," we have had one of unprecedented mildness. The mean temperature of January was 59.13 degrees Fah. and that of Feb. was 41.17 Pansies have bloomed in the open ground every month this winter. We have also had one or more thunder showers every month since last September. Wheat that was apparently killed last fall by the fly, is now as green as grass, and promises a good crop. Our pastures present the appearance of May instead of March. Fruit-men tell us they still have good prospects for an abundant crop. I held my hogs through the "temporary depression" last fall (as the Rural called it) and was rewarded by getting almost five cents per cwt. increase. Tobacco growers are preparing for an unusually large crop. One of my neighbor German boys sold four hhds. in Louisville last week that averaged $14.50 per cwt. all round. The crop brought him $550, and was grown on a little less than four acres. Of course, he is going to grow ten acres this season. S. E. H.

Ky., Owensboro, March 7th—We have had an unusually mild winter. Some rose bushes have retained green leaves all through the season and peach trees have been showing red for nearly three weeks in protected situations. Peaches have not been injured so far as I have been able to examine. Wheat is looking well. Some oats have been sown and some plowing is being done between showers. J. H S.

Miss., Okolona, Chickasaw Co., March 6.—We are having very fine spring weather—warm enough for April. Farm work is very forward. Corn planting has been begun and will be finished in a week, except on low lands. A. M

New York, Sharon Center, Schoharie Co., March 3.—We are having every indication of an early spring. Robins and blue-birds are here; the weather is warm and spring-like; in fact, the whole winter has been more like spring than winter. Grass and grain have suffered severely from the bareness of the ground and the constant freezing and thawing. Should the weather be as unfavorable for the next two months as it has been so far, winter grain will not be half a crop here from present indications. It is a great deal too soon yet to predict with any certainty the immense crop of wheat spoken of in a late Rural. A few years ago I paid $6 for about two bushels of potatoes of six different kinds, and to make them go as far as I could, I cut them in pieces of one and two eyes, and planted one piece in a hill and harvested the best crop of potatoes I ever raised. Since then I don't put two and three small potatoes in a hill, as I was taught when a boy. I shall cut all my Beauty of Hebron I raised last year from the one you sent me, into one-eye pieces and plant one piece in a hill. Last spring I thought I would try drilling in my corn. Some of the wise ones said I would never do it again, and I must confess I thought so too at one time; but when I harvested the crop and found I had the best yield of both corn and stalks I ever raised on the same ground, I made up my mind to plant in no other way. My corn was very fine and ripe, and it was a poor corn year, too. I found five ears and three stalks from one kernel of seed. I now have hanging up three stalks with 10 perfect ears of corn grown from one kernel of Blount's corn. Incog.

Penn., Rochester's Mills, Indiana Co., March 8, 1880.—This winter has been a bad one for hauling, there being but little snow. This is a forest county, but the forests are disappearing. There has been a heap of timber cut the past season, but it will not all go to market, for the roads have been too bad for hauling. Wheat looks pretty well, and a large acreage of it has been sown. The prices are:—wheat, $1.25; oats, 35c.; corn, 30c.; rye, 75c.; eggs, 10c. ₱ doz.; butter, 18c. Oil has been found about 15 miles from here, in Jefferson, Co.; the well is said to turn out 60 barrels per day. F. H.

Tenn., Humboldt, March 6.—Warm and very wet for the past month. Early-sown wheat is rusted and thought to be seriously damaged. Native Plums and Apricots are blooming. Before this is seen by Rural readers the trees here will have put on their green spring dresses. Clover and Grapes have been growing all winter. B. F. T.

Texas, San Antonio, Bexar Co, March 4.—The weather is fine; grass is growing fast. Corn is mostly planted. We shall commence planting cotton in a few weeks. I planted sorghum yesterday. Farmers here plant it in drills or broadcast for green fodder. It can be cut from two to four times. It is very good feed for pigs; there is nothing which they like so well and they fatten on it. G. W.

Utah, Ogden City, Weber Co., March 4.—We are generally blest with a variety of weather here during winter, and this has been one of the old-fashioned sorts. We have had the cold wave with snow at intervals, but the snow wave commenced on the night of the 22d ult. and lasted until the morning of the 26th, terminating with a cold, piercing wind from the north. Everything seems dull and dreary under the circumstances. However, there are good prospects for plenty of water for irrigation this coming summer, and the gardener and farmer expect a good harvest. W. J. H.

The Querist.

ANSWERS TO CORRESPONDENTS.

Caponizing Fowls.

D. B. C., Mt. Union, Ia, asks 1, how to caponize fowls; 2, where can the proper instruments be procured; 3, can turkeys be caponized.

Ans.—The best birds for capons are the large breeds, Asiatics or Dorkings. They should be two to three months old. Before the operation they should be deprived of food for from twenty-four to forty-eight hours, so as not to have their bowels distended. The bird to be operated on, must be fastened down on his left side to a board or bench through an auger hole; the wings should be drawn together over his back and well secured; the legs drawn backward, the upper one drawn out furthest and secured. The feathers must be plucked from the right, or upper side, near the hip joint, on a line with and between the joint of the shoulder. The space uncovered should be about one and a-half inch in diameter on an ordinary-sized bird. Draw the skin of the part backward so that when the operation is finished, the skin slides back to its natural position and covers the wound in the flesh, and does *not*, when neatly done, require sewing. Make an incision with a fine sharp penknife (or proper instrument is best), between the last rib and hip, commencing about an inch from the back-bone; extend it obliquely downward, from an inch to an inch and a-half, just cutting deep enough to separate the flesh; take great care not to wound the intestines. The wound must be kept open with an instrument with a spring, called a retractor, or with something answering the same purpose, stretching it wide enough to afford room for the work. Then, carefully cut the membrane covering the intestines which, if not sufficiently drawn up, may be pushed towards the breast-bone lightly by a spoon-shaped instrument, or the handle of a tea-spoon. The organs to be removed are readily recognized—a small reddish-yellow cylinder attached to the spine on each side, covered with a fine membrane or skin which must first be removed with forceps and a fine hook to draw it away. With the left hand introduce the bowl of a spoon (an instrument is made for the purpose) under the lower or left testicle, which is generally a little nearer to the rump than the right one. Then take the instrument called a cannula, which is a hollow tube with a horse hair passed through it, forming at the end a loop which can be tightened by pulling on the two ends of the hair at the other end of the tube. Pass this loop around the testicle with the help of something to place it in position, the cannula has a hook for this purpose, so as to bring the loop to act upon the parts which connect the organ to the back. Then by drawing the ends of the hair-loop backward and forward, and at the same time pushing the lower end of the tube or cannula towards the rump of the fowl, the cord or fastening of the organ is severed. A similar process is then to be repeated with the uppermost or right testicle, after which any remains of the organs, together with the blood around the wound or at the bottom, must be removed with the spoon. The reason for operating on the left or lower organ first is to prevent the blood from covering the lower one if left last. When the operation is performed, which if skillfully done occupies but a few minutes, the retractor is taken out and the skin drawn over the wound, which if it was drawn on one side before cutting (as mentioned above), will connect at a place not exactly opposite the wound in the flesh, thereby covering the flesh wound. If skillfully done it requires no sewing. The old French system was to operate on each side of the fowl, but the system here described is considered an improvement on the antiquated Gallic method.

2. Suitable instruments can be got from the Poultry Monthly, Albany, N. Y., or from the Poultry World, H. H. Stoddard, Hartford, Conn. 3. We have never heard of caponizing turkeys, though it probably can be done; but as the build of a turkey is quite different from that of a fowl, it would involve some surgical experiments which would, most likely, entail some loss, and the benefit would, in all probability, not equal that from a caponized fowl.

How to Make a Small Orchard in the Far West.

R. R., Greenwood, Ark., says: "I am just opening a new farm. Have 10 acres cleared and under fence, which have been cultivated in cotton five or six years. Wish to devote one acre to fruit trees:—Apples, Peaches, Plums, Pears, Persimmons, Cherries, Apricots—in fact all kinds of fruit that do well here. Will you please advise me how to proceed—what proportion of each do I require. One-half of the ground I desire to use for a garden and vegetable patch, and the rest for peanuts, while the trees are growing. The field has a gently rolling slope to the north; soil, sandy loam. The higher portion of the lot is somewhat rocky. The soil is partially made by the decomposition of the various rocks and shales of the great millstone grit formation which is annually washed down from the mountains, making it very rich and admirably fitting it for the growth of an orchard and vineyard."

Answer by Ex-Gov. Furnas, of Nebraska.

The proposition is not sufficiently definite to enable one to reply in a way at all satisfactory. Is the undertaking for "profit," or "pleasure," or for both? Again, if for profit, what is the character of the market relied upon? As a rule, among fruit consumers apples are the staple fruit and should preponderate. The orchard or ground in which Apples, Plums, Peaches and Cherries are planted, can be used for at least ten years for all small fruits as well, at the same time. The proportions of large fruits recommended would be one-half for Apples, one-fourth for Peaches, the other fourth about equally divided for Pear, Cherry, Plum, Apricots and Persimmons, as the taste or inclination of the planter might indicate Then, between the rows, and between the trees in the rows, plant small fruits. Preferably the rows should run north and south, for by that arrangement better effects from the *sun* would be secured. In addition to small fruits between the rows, vegetables may also be planted. By using all the space between the trees for vegetables and small fruits, prime cultivation is thereby more certainly secured, which is essential in obtaining any character of product from the soil. If profit is sought, early returns must be desirable. Therefore vegetables first and small fruits next must be relied upon, at least until large fruits come into perfect bearing. One should not think of dividing the ground in reality—one-half to fruits and one-half to garden. But plant all to fruits—large fruits—and occupy all the intermediate space with vegetables and small fruits. With this close use of all the ground, do not forget *the soil must be fed*, if growth is to be kept up and satisfactory results obtained. The "lay of the land" and the character of the soil as indicated, ought, with reasonable attention, to satisfy even a fastidious experimenter or cultivator.

Angora and Cashmere Goats.

L. R. S., Phœnix, Arizona Ter., asks whether Angora and Cashmere goats are identical; if not, what difference is there between them; 2, which would be the more profitable for wool; 3, where can the wool be sold, and at what price.

Ans.—The Angora and Cashmere goats are

often confounded, but they are really quite distinct, the former being a native of the eyalet of Angora in Asia Minor, about 220 miles E.S.E. of Constantinople, and the latter a native of Cashmere, Thibet, Tartary, and Mongolia. The Angora's hair covers the whole body and a great part of the legs with close, silky ringlets. It is composed of two kinds, the one short, coarse, and of the nature of hair, lying close to the skin; the other long and curly, and of the nature of wool, forming the outer covering. Both sorts are used by manufacturers, but the latter, of which the bulk is much the greater, is much the more valuable. The average clip, which is taken in the spring, amounts to about 2½ pounds. The best quality comes from castrated males, females producing the next best. The Cashmere goats have delicate heads with long, wide, semi-pendulous ears. The hair varies in length, fineness and color with different animals. As in the Angora, the coat is composed of two materials; but here it is the under coat that resembles wool, and the outer, hair. The inside one, always of a uniform grayish-white tint, is beautifully soft and silky, and of a fluffy description, like down. The inner coat only is sold, and this, which is combed out in spring, in a good specimen weighs half a pound. The Angora goat was introduced into South Carolina in 1849, and from that and subsequent importations it has been pretty widely destributed over the country since. It has thriven best in California, but even from there the latest accounts of its profitableness are not encouraging. A few of them among sheep may be useful, however, beyond the intrinsic worth of their fleeces, as they are said to be a sure protection against dogs. There is no regular market in this country for their wool, which is known as mohair. The price ranges from 40 cents to $1 per pound; the factories—of which there is one at Jamestown, N. Y., and others in Philadelphia—paying about 60 cents to 65 cents. The fleeces here are very uneven, and generally of poor quality, and imported mohair is generally used. Cashmere goats were introduced here by Dr. J. B. Davis, of Columbia, S. C., some years ago; and from that place the stock was introduced into Tenn and some other States; but it has greatly deteriorated everywhere, except perhaps in California; and from there no late accounts have reached us on the subject.

About Sorghum.

H. B., Greenville, S. C., ask 1, which is the best variety of sorghum for that section; 2, where can seeds be had and at what price; 3, whether any work treating of the subject has been published.

ANSWER BY C. M. SCHWARZ.

The best varieties for any section can only be found by actual test in planting several of the best known. I would recommend the three best for sugar and sirup, commencing with Early Amber as the first to ripen, although not yielding quite as much as the later, nor as much South as it does North. Next comes Early Orange, stalks short but heavy, like those of the Liberian of which it is a cross, ripening 12 to 15 days later than Early Amber, Honduras is next, the latest but largest of all, but I would not recommend it north of the latitude of St. Louis. For sirup alone the Liberian is perhaps the best; it will not make sugar, but stands any amount of rough treatment. It is for that reason called the lazy man's cane. The comparative yield with me this season (being a very dry one) per acre in gallons of heavy sirup, was:—Early Amber, 150; Early Orange and Liberian, 190; Honduras, 230. 2, I can furnish seed of either at 40 cents per pound by mail postpaid; 20 cents by express; 10 pounds or more, 15 cents per pound. 3, The proceedings of the Miss. V. C. G. Association, published in book form by I. A Hedges St. Louis, Mo., price $1, is perhaps the best for general information on the subject. Blymyer's Annual on Sorgo, can be had free by addressing Blymyer M'f'g Co., Cincinnati, Ohio.

The best results are obtained here by planting in drills averaging two stalks to the foot in the row, and rows three and one-half to four feet apart. Cultivate like corn, but the seed should be covered very lightly. The crop is not to be worked after it is four feet high. A nice-looking sirup can be made by rapidly boiling down the juice without the use of lime or other re-agents; but this will not remove the objectionable sorghum flavor, and to defecate successfully requires a good deal of experience. To defecate well, heat the juice in a plain pan to 180° Fahr. to coagulate the vegetable albumen; then mix in milk of lime 12° or 15° density of Beaumé saccharometer, 3 to 5 pints to 100 gallons of juice—the quantity varies with cane grown in different soils. Bring to boiling heat and draw the fire—it should not boil. In a few minutes the scum may be taken off and the juice run out to settle.

To retain a light color the juice should be made slightly acid again before evaporating. Dilute sulphuric, muriatic or citric acid, or good vinegar can be used for that purpose, but it must be borne in mind that those acids can only be used for sirup; they will invert the sugar. I did not mention the porous alum compound for the reason that it is troublesome for beginners to use. I would not advise these to defecate unless they have first had a chance to see it done by an expert. This will of course exclude them from making sugar.

Edwardsville, Ill.

Thumps in Horses.

W. M. K., Washington, D. C., has a young horse that puffs and blows very hard after having been driven briskly for a mile or two. During the warm weather last summer he did not blow under the hardest driving but began to puff just as soon as cold weather came on. After long or constant driving he gets a "second wind," and stops blowing. On the second day lately after having been driven hard, he seemed affected with the "thumps," but later on, seemed to be all right, and the ailment and a remedy are sought.

ANS.—This trouble arises from functional disorder of the heart, and is known as thumps. The blowing is caused by interference with the action of the lungs by the interrupted circulation. The action is intermittent and irregular and usually comes on after some excitement, such as severe work or rapid movement. The proper treatment is to keep the animal quiet for a time, during which a regular course of sedatives and tonics should be administered. These consist of 15-grain doses of digitalis given three times daily for a week, and then half a drachm of iodide of iron with four drachms of powdered gentian root given daily. The feeding should be the most nutritious and digestible; for instance, ground or crushed oats, sound hay and, once a day, two quarts of linseed steeped in hot water for 12 hours, with two quarts of wheat bran alternately.

Mixing Cream from Fresh and Farrow Cows.

M. B., Andover, N. Y., asks whether the cream from a farrow cow's milk mixed with cream from a fresh cow's milk will make the same amount of butter as if the cream from each cow were churned separately.

ANS.—It is impossible to say precisely, because the conditions are such that no exact result can ever be known and only relative knowledge can be gained. Thus we may add the creams together and churn them and produce so much butter; but it is obvious that we can go no further, and cannot tell what would have happened had the creams been churned separately. We may also churn the creams separately and get so much butter, but we can never know what the result would have been had the creams been mixed. A good many years' experience confirms the opinion of the writer that more butter is made by mingling the cream of a herd than by churning separately. Sometimes a farrow cow's cream will not churn alone, but will make butter when mixed with other cream.

Treatment of Corns on a Horse's Foot.

W. H. J., Newark, N. J. asks how to treat a corn on his horse's foot.

ANS.—Corns in a horse are different from those on the skin of a human being. They are first produced by blows or bruises which start inflammation and the formation of matter under the sole, or cause a deposit of horny matter which presses upon the sensitive inner parts of the foot. They are frequent in flat-footed horses, the frogs of whose feet have been pared away so as to bring the sole to the ground and subject it to continued bruises from stones. The usual mode of shoeing is one that protects the tender spots on the sole from blows in traveling. This is to put a shoe of sole-leather under the iron shoe and stuff under the leather with tow soaked in glycerine to keep the sole cool and moist. If the sole is very tender, the feet should be prepared for shoeing by keeping them upon a puddle of wet clay for a few days, and by frequent dressings of cold water and by giving the horse a cooling medicine, as eight to twelve ounces of Epsom salts.

To Make a Hot-Bed.

L. G., Brownsboro, Ala., asks how to make a hot-bed.

ANS.—Dig out a pit two feet deep, six feet wide and as long as needed, line the sides with rough boards which at the front, or toward the south, reach three inches above the ground and at the back nine inches above ground. Fill this with a mixture of stable manure and leaves which have been turned over a couple of times so as to be heated uniformly throughout. Put on six inches of light soil, and when this is uniformly heated and the heat in the soil has fallen below 90 deg, as shown by the thermometer, the seed may be sown. Hot-bed sashes can be bought already made at sash-and-blind factories; the usual size is three by six feet. When the soil is ready to plant, strips should be nailed across the frame on which to slide the sashes. In the North the depth of the bed should be 2½ to three feet so as to allow room for a sufficient amount of heating material After the plants are up give air liberally by raising the sashes.

Roots for Sheep.

J. S., Kendallville, Ind., has 200 head of sheep, all of them ewes, and having this spring felt the need of roots for them, he asks which would be the best kind for them; will one acre produce enough for such a flock; how much seed should be used per acre.

ANS.—Raise the Kinver Yellow Globe or the Long Red mangel. One sheep will eat a peck of cut roots per day; 200 sheep will eat 50 bushels daily or 5,000 bushels in 100 days, but two quarts daily will give an excellent supply of this kind, so that about 1,200 bushels would be the smallest allowance for this flock. A fair crop would be 800 bushels per acre. If the seed is sown by hand in the drills, six pounds per acre will be sufficient; sow as early as possible after the ground is in good condition for working.

Crippled Hogs.

M. W., Laporte, Neb., asks what ails her hogs; they first lost the use of their hind legs and then of their fore legs and are badly crippled up. They were doctored for kidney worms, without any good results. Their appetite is good, however.

ANS.—We would certainly advise the removal of these swine to higher ground and good beds as well as cover from inclement weather. Then give a full purgative, as castor oil, three to five ounces, according to size of animal. Afterwards give tonics twice a day—either sulphate of iron, pulverized and one-half teaspoonful mixed with feed, or tincture of nux vomica, one-half ounce doses. Perhaps a blister over the spine will be required if the pig is very sick.

Miscellaneous.

J. G., Fremont, Minn., asks, 1, whether European carp would thrive in a pond 12 rods long, five rods wide and 12 feet deep in the deepest part; 2, where can they be had; 3, where can the veterinary works referred to in Querist Department of RURAL for Feb. 14, be purchased.

ANS.—1. European carp will thrive well in any pond in which the water is not too cold. A temperature of 60 degrees suits them best. A deep pond would be necessary in Minnesota where the climate is cold in the winter. Vegetable food is required and a swampy shore or muddy bottom with water plants, is the most suitable. 2. We do not know where they are to be procured. Perhaps the Commissioner of Agriculture at Washington can inform you. 3. Any book referred to in these columns may be procured through any local bookseller from his New York agent or from the American News Company, New York. The latter will also tell the prices.

A subscriber—no address—complains that some inquiries sent us formerly were not answered, and asks, 1, do fancy-foliaged Caladiums blossom; 2, is there a spotted Calla; 3, should the young bulbs that form round the roots of a Calla be removed: 4, the name of a plant a specimen of which was sent us; 5, what will thoroughly clean a blue cashmere dress without injury.

ANS.—We have frequently said here that the name and address of each inquirer must be sent to secure attention to his or her questions; the non-compliance with this rule was probably the cause why the former questions were not answered. 1. They are phænogamous or flowering plants, but do not usually blossom under ordinary greenhouse culture. 2. No. 3. Yes, in May and set out in the open ground. 4. We have not received the specimen referred to. 5. We recommend "Household Ammonia" for the cashmere dress; it can be procured at almost any grocery store.

H. C. F., Elmira, N. Y., has a rose bush that was purchased several years ago of a traveling man for $1.50, but although it has made a vigorous growth every year it has never bloomed. It has been propagated and the young plants possess the same non-blooming peculiarity. He asks how to treat the plants to make them bloom.

ANS—.Are you sure it is a rose bush? We have heard of a traveling man selling a Virginia Creeper for a Grapevine, this may be a parallel case. We can suggest no course of treatment that will oblige this doubtful character to bloom.

W. H., Cambridge, Mass., asks what books on botany and bee-culture we would recommend for beginners.

ANS.—For young students use Gray's Lessons in Botany, price $1.50; for pupils of maturer minds, Gray's Structural Botany and Wood's Botanist and Florist are both good; cost about $3.00 each; can be had through book stores. For instruction in bee-culture use Cook's Manual of the Apiary, published by T. G. Newman & Son, Chicago, Ill., price $1.00.

W. H. W., Hanerville, Wis., asks where can he get seeds of Iris lævigata, I. aurea, and some others.

ANS.—All seedlings of Iris lævigata (known as Kæmpferi in catalogues) are almost sure to have beautiful flowers. Iris aurea is rare in cultivation, but all may be had from Woolson & Co., Passaic, N. J.

M. T., East Shelby, N. Y., asks if mangels will do well on a timothy sod, plowed fresh this spring. The land, which is a heavy loam with clay subsoil, has been in pasture for many years, and is very rich.

ANS.—If the land is well pulverized we see no reason why it should not give a good crop of mangels, though the soil would be better fitted had it been plowed in the fall.

A. A. D., Jamaica, N. Y., says: "Please inform me what kind of grass is suitable for woods, pastures; when to sow the seed and what amount is required per acre."

ANS.—Kentucky blue grass and orchard grass. The seed may be sown early in the spring at the rate of one bushel of each per acre; but the grass should not be used for pasture until the fall.

A. W., River Falls, Wis., has some late turkeys which are lame, some in the foot and some in the joints, and a remedy is asked for.

ANS.—Little can be done for this sort of lameness. Rub the legs with alcohol and camphor, or kerosene and sweet oil, twice daily for three or four days and give stimulating food, such as dough made with oatmeal, chopped onions, etc.

A. S., Lafayersville, N. Y., asks 1, whether the Plymouth Rock and the Brown Leghorn would make a valuable cross; 2, is Soul's wheat a valuable variety, where can it be obtained and its price.

ANS.—1. We have heard good accounts of such a cross, and in view of the excellence of both parents, the offspring should turn out good. We don't know the variety.

D. C. H., Homer, N. Y., sends the flower and leaf of a plant, the name of which she would like to learn. It was given to her as a Cactus. It has a great many thorns on the branches, bears small cymes of red flowers and blooms all through the winter.

ANS.—The flower sent is that of Euphorbia splendens. It is not a Cactus, or in any way related to it.

J. T. H., Woodbury, Ky., asks for a good bee journal.

ANS.—The American Bee Journal, published by T. G. Newman & Son, Chicago, Ill., is an excellent monthly. The Bee-Keepers' Magazine, 61 Hudson Street, N. Y. City, and the Bee-Keepers' Exchange, Canajoharie, N. Y., are other journals on the subject.

R. W. Northville, Pa., sends a flower and leaf and asks for the name of the plant, and how to take care of it.

ANS.—It is Oxalis rosea, commonly cultivated in greenhouses. After flowering let the bulbs dry out to give the plant rest. Repot in fresh soil in September.

W. H., Savannah, Ga., asks how can he determine the weight of horse and cow manure in a pile 30 feet long, 15 feet wide and 6½ feet high.

ANS.—Manure in a fresh condition weighs 60 pounds to the cubic foot. Your pile contains 2,925 cubic feet, which is equivalent to 87 or 88 tons.

A. C. M., New Gloucester, Me., asks, which is the best creamery in the market.

ANS.—It would be invidious to decide which is the *best*; but the following are several excellent ones:—the Ferguson Bureau Creamery, the Cooley, the Reid, and the Mosely and Stoddard.

J. J. W., Nodaway, Iowa, asks where in the West can he buy, 1, Jersey Red Pigs, and, 2, Oxfordshire Down Sheep.

ANS.—1, Smoek & Blakely, Monroe, Green Co., Wis.; 2, Mrs. Ann Newton, Pontiac, Mich.; S. H. Todd, Wakeman, Ohio.

E. H., Kirkland, Ill., asks where and at what price is a paper devoted exclusively to gardening published.

ANS.—Gardener's Monthly, published by Charles H. Marot, 814 Chestnut Street, Philadelphia; terms, $2.10 per annum.

A Subscriber, Paxton, Ill., asks where can a small bone crusher be obtained.

ANS.—Write to the Blake Crushing Machine Co., of New Haven, Conn., *and give your name*, not a *nom-de plume* as here.

A. J. F., Windom, Minn., asks whether the Pulvermacher Electric Galvanic Belt Co. of this city is quite reliable.

ANS —Yes, thoroughly so. The same can also be said of the branch office in Cincinnati.

J. E. & C. J. P., Hornellsville, N. Y., want the address of a firm engaged in the manufacture of pickles.

ANS.—Bogle & Lyles, 87 Park Place, New York.

A. P. R., Yorkville, Ohio, asks which is the best season to cut Sugar Maple for boards.

ANS—In the fall.

W. H. J.—G. G. K.—F. D. C.—H. T. A.—A. J. H.—A. M.—J. W. S.—R. T.—A. T.—A. W—N. J. B.—H. M.—J. A. P.—B. F. T.—G. W.—B. G. J.—A. J. F.—A Subscriber.—J. E. Du B.—N. C.—M. W, H.—W. R. B.—W. F.—A. B. THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address THE RURAL NEW-YORKER,
78 Duane Street, New York.

SATURDAY, MARCH. 20, 1880.

REMOVAL.

On and after May 1st of this year the Rural New-Yorker will occupy its new quarters, No. 34 Park Row, corner of Beekman Street.

A CAUTION.

It has become necessary that we should state that one C. H. E. (or C.) Redding was discharged from the employ of the Rural New-Yorker during the latter part of last year. All persons are cautioned against transacting any business with him on our account.

The gross earnings of thirty-two Western railroads during the month of February aggregate $9,570,903, against $7,285,864 for the same time last year—a net increase of $2,285,039, or over 31 per cent. Only two railroads show a decrease and that is trifling. This is a fine showing for the winter season, and an excellent proof of the great improvement in business this year.

When well bred, like the Percheron, Norman, Clydesdale and Shire horses, an increased size is no objection to a horse's activity on the farm or road, especially in the walk, which is extra fast when properly trained, and is the most important gait for the use of the farmer. The advantage of using an extra-large, powerful horse is that he will do the work of an ordinary pair, and a pair of them equal four of the common sort. This saves something in stable room, grooming, feed, harness, shoeing and general care and attention. It is also much more convenient often to use one horse than two. With the former one can plow nearer to trees and fences and work more rapidly with a one-horse tip cart, than with a two-horse wagon. It is surprising that one-horse carts are not in more use among our farmers. In many parts of Europe they are used exclusively. Loads of all kinds are tipped up in part or entirely, as desired, in a second or so, while from a wagon it takes a considerable time to unload. A cart can be used in a narrower farm road than a wagon, and be turned in one-third to one-half the space required for the latter.

All over the country strikes among workmen are either actually inaugurated or threatened. These were to be expected from the rapid improvement in business, which has raised the price of manufactured goods from 25 to 100 per cent., and from the natural reluctance of manufacturers to share their increased profits with their employes. In many places wages have been raised considerably, and it is to be hoped that some compromise may, in other cases, be speedily effected, by which the stoppage of the wheels of business may be prevented or removed. Strikes are lamentable occurrences at best, causing a world of suffering to the strikers, no small losses to the employers, and a sad amount of ill-feeling between the two classes whose friendly co-operation is necessary to each others' prosperity. According to the Statistics of the Mass. State Bureau of Labor, out of 159 strikes recorded in that State, 109 were failures, 16 were compromised and only 18 were successful—a poor show for strikers. Yet had the employers compromised matters, it is not improbable their gains would have been at least as great, and the prosperity of the State would certainly have been greater. It is not the accumulation of money in the hands of a few in a State or nation, that renders its inhabitants happy and prosperous, but its distribution among the people at large.

It has often been noticed that an Englishman traveling in America finds few things so strange and foreign to all his habits of thought as Indian corn. His doubts and difficulties at the dinner-table as to how to proceed when he first meets a boiled ear of corn, are apt to be comical, to say the least; while his expressed opinion upon the flavor of corn-cake is not infrequently the reverse of complimentary. So, too, for a thoroughly independent view of popped-corn, such as no American who ever lived could possibly have written, we may turn to the Himalayan Journal of Dr. Hooker, who relates that at a camp on the confines of Thibet, the natives gave him "Parched rice and wheat-flour, cured, and *roasted maize.*"; and proceeds to explain in a foot-note that the last-named refreshment is "prepared by roasting the maize in an iron vessel, when it splits and turns partly inside out, exposing a snow-white spongy mass of farina. It looks very handsome, and would make a beautiful dish for dessert." It is a curious question in philology, how long the English and the American languages would retain any resemblance to one another if there were many such stumbling-blocks as maize.

In one of the private gardens of Aiken, S. C., there are 25 tea plants five years old. They are about three and a half feet high and, though growing in a sandy soil and dry situation, they are healthy and vigorous. It has been thought that the tea plant needs shade and moisture. This is true of young plants; but the roots of older ones extend to such a depth that they will endure both heat and drought as well as the hedges of Euonymus, which are so beautiful and thrifty in the gardens of many parts of the South. The tea plants of which we speak, if stripped, would yield enough tea to supply a small family through the year. The leaves are first steamed, then dried in an oven. Thus prepared, without any further manipulation, the quality of the tea is equal to, and of much the same flavor as, that known as good Oolong. There need no longer be any question whatever as to whether the tea plant will flourish in certain Southern States. The only question is one of quality and cost as compared with the imported article. The facts given above as to the Aiken trial which have come under the writer's observation, are specimens of hundreds that should inspire confidence as to our ultimate success in this highly important industry.

There is little doubt but that the immigration from Ireland during the present year will be greater than in any twelvemonth since the famine of '47-8 sent the tide of Celtic immigration with unexampled force across the Atlantic. Already the inpour has begun, an unusually large number of Irish immigrants having landed at this port during the past couple of weeks. Various organizations have been formed, both in this country and across the Atlantic, to aid in this movement, and efforts are being made to settle many of the new-comers in agricultural pursuits. Hitherto Irish immigrants to this country have seldom engaged in agriculture here, although farming was the business of most of them at home. As a rule they have reached our shores with barely enough money to keep them for a few weeks, when necessity forced them to take the first job that offered, and this has seldom been on a farm. Moreover, besides lacking capital enough even to make a small start in farming, they have been destitute for the most part of the steady, persistent industry needed to transform the farm hand into the farmer. It is proposed to settle various colonies of our expected visitors in different parts of the West—we wish all success to the experiment.

At this stage of progress in American agriculture, *steadiness of purpose* is a quality that needs development. Change from one specialty to another with every extreme in the movement of prices, is natural in the experimental period of rural industry in any new country; and this country furnishes no exception to the rule. To leave sheep husbandry after prices have declined, and put the meagre proceeds into meat production, or dairying on a rising market, just in season to meet a disastrous fall, while wool is beginning to advance, has been a frequent experience. Jumping from one business to another without experience, is a leap in the dark, that has wrought injury to multitudes in every community, and ruin to many. Success is hereafter to depend so much upon skill and systematic endeavor, that the only safe road to it will be through intelligent and persevering practice of a chosen pursuit. Examples could be multiplied in every section of the country, in every line of culture, showing the superior profit, in the past, of persevering adherence to this rule. In fact the men who have succeeded, those who have acquired competence and reputation for skill, are almost invariably of this class. Agriculture, as a game of chance or as a land speculation, must give way to science and method with perseverence and close application. Young farmers especially should understand this necessity.

A few weeks will see in Great Britain the excitement and turmoil of a general election which, judging by past experience, will be marked with far more violence, bribery, drunkenness and temporary demoralization generally, than will attend our own presidential election a few months later. Lord Beaconsfield, early in the week, unexpectedly declared his intention of appealing to the country in support of his measures for a vigorous foreign policy on the one hand, and an uncompromising opposition to the schemes of the Irish Home-rulers on the other. The honor and influence of the British empire, he maintains, demand the former, and its security and permanence, the latter. The Liberals are now bitterly denouncing the foreign policy of the Administration on the ground that it has secured no advantage for the country, while entailing upon it many responsibilities whose weight must yearly weigh heavier upon it. The Home-rulers are equally or even more violent in their reproaches of the home policy of the Conservatives, which has exasperated the discontent of the inhabitants of one of the chief provinces of the empire, while it has left the distress which is agonizing it to be relieved by the charity of the outside world. As the duration of each British Parliament cannot be longer than seven years, the present House would have to be dissolved next year; and doubtless the astute Prime Minister, in anticipating its inevitable dissolution, sees that at this moment the temper of the public is favorable to his side. It would, however, be as difficult to foretell the result of the next general election in Great Britain as to forecast the issue of our own presidential election next fall.

Which Shall it be, Cattle or Grain?—Both. A mixed husbandry is safest for the masses. The South has suffered from scarcity of meat and milk, and plethora of corn and cotton. Many a Minnesota farmer has helped to feed the East and England, while he has been destitute of milk for his coffee, or butter for his superabundant bread. It has been repeatedly shown that those countries which produce corn and cattle most largely, boast a higher land valuation than the great wheat countries. It is not only in Indiana and Illinois, but in the new State of Iowa as well where spring wheat has ever been a speciality. Taking a broad view of the future requirements for meat and bread, we see that it is the policy of all nations (Great Britain alone excepted) to produce their bread at home. They dare not risk dependence in so vital a matter. If a bad harvest makes a small deficiency, it can probably be made good; a very abundant harvest may give a small surplus. Meat is less bulky and will better bear the expense of transportation; so the use of meat by European nations is increasing, and the price has steadily increased during the past 30 years. On the contrary, wheat, with temporary fluctuations, is no higher than in the long ago. James Caird says the cost of bread in England was a farthing per pound both in 1770 and 1878, while meat advanced from three and one-half to nine pence in the same time, and from five to nine pence between 1850 and 1878. The recent and unprecedented foreign demand for wheat is the result, in part, of a series of extraordinary crop failures which will not permanently continue. The enlarged demand for meat is in far higher degree the result of causes more permanent in their operation. The outlook for meat is, therefore, better than for grain. Yet both will be required, as population increases, in rapidly enlarging quantities.

During the last couple of weeks upwards of 500 Chinese have reached this city from San Francisco, and should the present anti-Mongolian agitation continue on the Pacific Coast, a much heavier immigration of the same sort must be expected. Of course, the threats of Kearney and his turbulent followers are to be greatly deprecated; of course, any violence they may attempt should be promptly and vigorously suppressed. The supremacy of the law must be maintained; grievances, however onerous, must appeal for redress by legal methods only. The anti-Chinese grievance of the laboring classes on the Pacific Coast, however, is a real and severe one. It is one that has been found intolerable wherever the cheap labor and few needs of the Mongolian have come into competition with the higher-priced labor and more civilized wants of the Caucasian. Civilization is a developer of wants, and before the white man can work for the same wages as the yellow man and be content with the same fare, he must retrograde to the same semi-barbarous condition. In New Zealand and in all the Australian colonies it has been found necessary to legislate against the influx of immigrants from the Flowery Kingdom. The laws that have been found efficacious against the evil there are even more oppressive than those which the California workingmen seek to establish. There, as in California, it has been a struggle for existence between the two races; and self-preservation has made the white man deaf to the doctrines of political economy and the plea of abstract justice from those whose condition or location has preserved them from the hardships entailed upon the laboring classes by competition with the cheap labor of the "Heathen Chinee." If the superabundant population of the crowded Chinese empire must have an outlet, why do not the almond-eyed tail-bearers establish colonies of their own along the vast unoccupied coast of continental Australia?

BREVITIES.

Mr. J. J. Hallford near Grahamville, S. C., has an apple tree that bloomed last December and is now loaded with apples as large as quail eggs.

It is probably a good rule for the farmer to work upon that of staple crops, those which sell for a high price one season will sell for a low price the next.

Mr. Norris writes us from Alabama that he deems Cow-peas a subject of such magnitude that he is compelled in the interests of Agriculture to speak out.

From our correspondent at Aiken, S. C., we learn that the Japan Persimmon is thereabouts exciting much interest. Many plants, purchased at the north, are being tried.

Dr. Hoskins owns a farm of twelve acres and gets a living from it and pays his debts. He believes his income from it more than that derived from many farms in Vermont of 100 and 200 acres.

A gentleman just returned from Florida tells us that in the grove of Col. Hart (opposite Pulatki) is an orange tree from which 10,000 oranges have been picked during the past year, netting him over $250. We know this report to be trustworthy, but such instances rarely occur and should not be received (as they are too often) as evidences, of the usual profits of orange culture.

Our friends, in selecting vines for the coming season, should not forget the hardy and beautiful Clematis. For blue there is no better kind than Jackmannii. Henryi bears a large silver-white flower. Velutina purpurea is of a dark mulberry color. Miss Bateman is pure white. Fair Rosamond is white tinted with lavender, having a light-red band through the middle of the petals.

The value of the Polled Scotch Cattle as beef-producers is fully acknowledged in England. The Royal Agricultural Society, however, is opposed to offering any prizes at the Carlisle meeting. Five hundred dollars are in prizes for Ayrshires, but no encouragement is offered for the Polled Scotch, from which, it appears, is derived a considerable part of the best beef that goes to the London market.

There is as much suffering in other countries as in Ireland. Russia is ravaged by famine, typhus and diphtheria, and thousands are perishing throughout the vast empire, though no suggestion of "relief funds" is made. So in Silesia and Italy misery prevails to as great a degree as in Ireland. Sir S. Northcote has recently said in Parliament that not a single case of actual starvation has been known to occur in Ireland. On this side of the Atlantic, too, advices just received from Brazil give heart-rending accounts of the famine now desolating several provinces of that empire.

Early in the week the President sent a message to Congress, in which he takes the ground that whatever nation may supply the capital for the construction of the Isthmus Canal, the work is of such vital importance to the prosperity and protection of this country, that the United States must be its recognized protector and controller. This official declaration has come not a moment too soon. No room for doubt with regard to the position of this country in this connection, should be left among other nations. A frank and bold enunciation of that position now will doubtless save a world of complication and bickering, or worse, hereafter.

The recent poisoning of a whole family in Canada, from eating cabbages, upon which it is supposed Paris-green had been sprinkled, should prove a warning to farmers against a careless use of this class of insect remedies. Paris-green is largely composed of arsenic, is almost insoluble in water, retaining its active principle for years, and a very little of it may prove fatal. It is well enough to employ it upon potato tops, the cotton plant, and the foliage of such other plants as are not used for food for man or animals, but its use upon, or even near any other kind of vegetation, especially in the kitchen garden, is fraught with danger. There are plenty of useful means by which the cabbage worm may be destroyed or its ravages lessened, without resort to violent poisons. In the case to which reference is made, there was fortunately but one death, though five persons were affected.

For Women.

CONDUCTED BY MISS RAY CLARK.

DAME FASHION.

FASHION, fickle goddess, has led her votaries into such extravagances, that she has brought down on herself the denunciations of sensible men and women—and serves her right; but whether she has been won over and moans to mend her ways, or whether she is only like that little girl with the curl, and is just now very, very good, while she will presently be horrid, and lead the way into, nobody knows what lengths of absurdity; at any rate, she certainly is now, unprecedentedly good, and I feel it in my heart not to withhold a commendatory word.

Perhaps, never before was comfort, health and convenience so studied in connection with dress. For one, I confess myself happy to be able, without making myself conspicuous, to wear clothes that feel comfortable, or rather that I do not feel at all. It is really delightful to put on the short dress of to-day, no dragging train to carry, and one less backache to soothe. Perhaps I am prejudiced by my comfort, but it seems to me that women never looked so well before. We have actually come to a place where extremes seem to be left out, except with the empty-headed few, who will always strain anything into extremes.

We have neither the unwieldy leviathan of crinoline, nor the insufferable tie-back, but skirts that clear the ground and with just fullness enough, answering to the old lady's idea of a dress skirt, "a walking length and a striding width." To be sure trimming is in many cases overdone, but a plain dress with a little graceful drapery, is by no means an oddity. O, woman! do fall so deeply in love with the simple short dress, that you will never give it up, never!

Large waists, too, are admissible. Think of the days when the wasp was the ideal of womanly beauty. Physicians, teachers, and old wise-heads lectured, talked and wrote against it, but a line from a novel describing Belinda's slender, tapering waist, had more weight with the most of the feminine sex. But Dame Fashion decreed "Woman shall breathe again," and Presto! forthwith corset strings were loosened, and heart and lungs and liver took a new lease of health and life. There are some brainless creatures yet, who know no better than to rejoice in a waist that is out of all proportion with their shoulders and hips; their loss will not be felt much when they finally break in two.

Talk about the good old days! Rather pity your buried grandmothers, aunts and other feminine ancestors, wishing that they could have lived in this decade! How did it all come about! Who studied out and skillfully cut and fitted the patterns for underclothes that are a joy to wear? Think of the old bands and bands, that cut and sawed and "skewed round." Now with garments dependent from the shoulders, with the corset waist or corded waist, or "Health" waist, furnished with fastenings for the skirts, so that their weight need not hang on the hips. We pity the queens even, who lived and died before this happy change was brought about.

Even the shoes have had a reform! The high, tapering heel, set in the middle of the foot, on which idiotic fashionables precariously balanced themselves, has given place to a low, broad one, and poor, pinched toes are trying to recover their identity in wide, roomy shoes.

To go from the feet to the head, a lady's dressing-table is no longer covered at night with rolls, curled hair and switches, and her head in the daytime is not of such extraordinary proportions, and intricate make-up, as to be a source of amazement to one not accustomed to the arts of higher civilization.

As for headwear, there are bonnets and bonnets, and hats and hats. Hence, in spite of the many useless and startling affairs with which some will always offend the eyes, there are really sensible shapes and styles of adornment. They are large enough to suit even a man, and many of them light and soft, and altogether comfortable. Hoods, too, again—pretty, fluffy hoods—that cover up one's ears and are proof against the nipping fingers of the most spiteful frosts. And the children, too, have little bonnets or hoods. Many a time I have shivered with horror to see little girls on a cold winter's day with tiny hats set on one corner of the head, they looked so blue and cold. Now it is the fashion to keep warm.

Tyrannical dame, have you had enough of despotism, or are you only resting a little preparatory to a new raid, seven times worse than ever before? I am ashamed to say it, but I suppose there are millions of women who would be ready at the first note of your majesty's announcement to make guys of themselves to any extent, for never had ruler such absolute sway as you! Or was the common sense of those wiser women who cried "Treason" infectious, and have you gone over to the conspirators? Or did you feel some compunctions on account of the physical woes of many of your blind followers—woes consequent of your mandates? Or were you brought down by the anathemas that were hurled at you from pulpit and platform by the satire, ridicule and caricature that greeted you everywhere?

There is nothing more Pharisaical in my burst of self-congratulation. I know there are still enough petty feminine weaknesses to lament, and there are enough ever ready to raise their voices in lusty lamentation over past sins, if not present ones; but I for one am encouraged, and I do feel like sending up a jubilant hymn of thanksgiving, though in the interludes I confess that I improvise a litany, from filters and panlers, from tie-backs, fantails and Grecian bends, from any relapse into the unmitigated follies of which the feminine gender has heretofore been guilty, deliver us.

CONTRIBUTOR.

ARTICLES FOR HOME MANUFACTURE.

I SAW a very pretty shaving paper case a short time since. It was of silver card-board, cut heart-shape, but very broad. It was slashed at regular distances from the edge, and a blue ribbon run in, a bow and ends of the ribbon were sewed on to hold the two sides, and the bright tissue papers that were placed between the article were about twelve inches across, the ribbon an inch and a quarter wide. Such an article would be very pretty made of Bristol board pinked around the edges and ornamented with handsome embossed pictures. Gilt card-board would be still handsomer, and may be more or less elaborately ornamented with a contrasting color of zephyr or embroidery silk.

Purses of sadlers silk either crocheted or netted are useful, since silver has come into circulation again. They are so easily made that very little description is necessary. The meshes should be quite fine. Two rings for slides must be provided. The opening is made lengthwise in the center of the purse and should be two and a half or three inches long.

Slipper cases may be made, costing from a mere nothing to as many dollars as your purse and inclination will allow you to spend. They may be cut into any pretty shape from pasteboard, covered with fancy paper and embossed pictures. A pocket of any bright or plain goods may be used, bordering it with a ruching in a contrasting color. If you wish it still nicer, it can be elaborately embroidered on canvass in Berlin wool, and finished by the upholsterer or finished at home by putting a large cord around the edge to suspend it by, with balls or tassels to correspond.

Fern holders are very pretty made of a lantern globe, when no other glass presents itself, and ornamented with transferred pictures. Another style is with a frame for the back, and a pocket in front, formed of long oat straws, cutting them between the joints, winding them with very narrow strips of gilt paper, so that it will show as much of the straw as the paper. Sew the straw frame together at the corners, leaving an inch or so, rustic fashion, then finish with tiny cord and tassels.

The back should be six inches wide and ten long, the front lacking four or five inches of reaching to the top, and joined at the bottom. When the two frames are completed, stretch on them pink or white tarleton, tacking it underneath, lightly to the straws. Then paste embossed pictures on the front piece and the upper part of the back.

Suspend with cord and tassels. Another cord and tassel at each upper corner of the front piece is fastened to the back in such a manner as to let the front fall forward a few inches to form a pocket.

Another fern holder can be made of Bristol-board pinked and ornamented with pictures and put together in the same manner as the last described.

The tarleton has a fairy-like appearance that is very charming. Tassels or balls for these delicate-looking articles, should be made of pink and white zephyr or something equally dainty and delicate in color.

L. E. K.

HOW TO MAKE MOSS BASKETS

VERY beautiful baskets for holding flowers can be made of the longer and more feathery kinds of mosses. We have made them often, and never do either garden or wild flowers look more lovely than when clustered upon a verdant border of that most delicate and beautiful material, which by proper management may be made to preserve its freshness and brilliancy for many months. We will here give directions for their manufacture. A light frame, of any shape you like, should be made with wire and covered with common pasteboard or calico, and the moss, which should first be well picked over and cleansed from any bits of dirt or dead leaves which may be hanging about it, gathered into little tufts and sewed with a coarse needle and thread to the covering, so as to clothe it thickly with a close and compact coating, taking care that the points of the moss are all outward. A long handle, made in the same manner, should be attached to the basket, and a tin or other vessel, filled with either wet sand or water, placed within, to hold the flowers. By dipping the whole structure into water once in three or four days, its verdure and elasticity will be fully preserved, and a block of wood, about an inch thick and stained black or green, if placed under the basket, will prevent all risk of damage to the table from moisture. To make such baskets affords much pleasant, social amusement for children, who will find a constantly renewed pleasure in varying their appearance.—FLORAL CABINET.

HINTS FOR WOMEN.

New linen may be embroidered more easily by rubbing it over with fine white soap; it prevents the thread from cracking.

To remove grease from wall-paper—Lay several folds of blotting-paper on the spot and hold a hot iron near it until the grease is absorbed.

To take ink out of linen—Dip the ink spot in pure melted tallow, then wash out the tallow and the ink will come out with it. This is said to be unfailing.

If brooms are wet in boiling suds once a week they will become very tough, will not cut a carpet, will last much longer and always sweep like a new broom.

To remove rust from a stovepipe—Rub with linseed oil (a little goes a good way); build a slow fire at first till it is dry. Oil in the spring to prevent it from rusting.

To clean brass—Immerse or wash it several times in sour milk or whey. This will brighten it without scouring. It may then be scoured with a woolen cloth dipped in ashes.

FASHIONABLE WOODEN SHOES.—A French novelty is the artistic "sabot," instead of a boot or shoe. It is made in the shape of the wooden shoes worn by the French peasantry, but of beautifully carved cedar, rosewood, or colonial bark. It is ornamented with silver or other metal settings. It can be made, too, of black stained wood and set with steel knobs. It is a much prettier invention than the turned-up Chinese slipper. It diminishes the foot in size and exhibits the silk clock or striped filoselle hose. The "sabot" is also advantageous to the Marguerite balayeuse, a new frilling for the inside of skirts. It consists of a band that is plain instead of being kilted, and is made either of superior muslin or plain percale. Three rows of embroidery are gathered at the lower basis, one above the other, so that the foot emerges from a small labyrinth of delicate snowy work.

TABLE DECORATIONS.—Nothing is prettier to grow in an epergne dish than moss, using the large feathery and matted kinds, and arranging them so that the straggling parts are tucked in. Sprays of ivy, small ferns, especially the common polypody and hart's-tongue—which, when rooted, last for weeks—may be interspersed, and the whole should be sprinkled well every day. If it is occasionally put out for a couple of hours' soaking in the rain, the dish will keep green for weeks. This will require no cotton wool; but pretty green for growing in wool may be had by cutting off the tops of carrots, with their crown leaves, and setting them as close together as they will lie. They should be kept rather moist.—A LADY ETCHER.

CORRESPONDENTS' CORNER.

IF Mrs. F. M. B. will try placing her mildewed clothing on snow and then sprinkle more over it and let it remain a week or more (the sun must shine on it), I think she will be satisfied with the result. This recipe has been tried on clothes very badly mildewed and never known to fail.

Will Miss Clark have the kindness to give Dr. Dio Lewis's address and oblige? EXPERIENCE.

MRS. F. M. B.—If you have wood ashes and make your own soap, dip the article mildewed in the soap barrel, until thoroughly saturated, with the soap, and spread in the July sun. Bring in nights, or if it should rain. Repeat the dipping if necessary. It takes several days.

MRS. M. B. MCLOUTH.

The above recipes have been selected from several received, the others being similar to these or ones published in "Domestic Economy."

Dr. Dio Lewis is not in New York city; if his address should be obtained, it will be given in another issue. R. C.

IN the RURAL of February 7, a sister wishes to know how to wash mourning calicos. Take five cents worth of glue for washing one dress. Dissolve the glue in the water, wash and not rinse. It looks as good as new, that is my experience.

A. E. H. S.

SEEING an inquiry how to starch black calico without the starch showing white on the material I will say that I have made starch for black lawn, using strong coffee instead of water with very good results. I wet the starch with a little cold coffee and pour on the rest of it while boiling, precisely as ordinary starch is made; and starch the material in the usual way. AUNT RACHEL.

WILL some one be kind enough to give directions through the *Woman's Department* of the "RURAL" for making pretty but not too expensive *Lambrequins* for a parlor in the country, and if some one will suggest something new in the way of *curtains*, I shall be much obliged. EFFIE.

Literary Miscellany.

SKETCHES OF GERMAN LIFE.

BERTHA A. WINKLER.

At Home.

HITHERTO we have only seen the peasants under the most favorable circumstances, gathering abundant harvests; enjoying popular festivals; and, in general, making merry over the most trifling incidents; apparently a most good-natured, contented people. But was it always thus? Are these happy, peace-loving peasants whose world is their village, their forest and their weinberg always amiable and contented with their lot? We will see.

A few days later we removed bag and baggage to the house of a well-to-do Burger, where, judging from the prim attire and joyous faces of the good folks, our expected arrival was made into a holiday. The fragant odor of juniper twigs greeted our entrance into a large airy room furnished with rude but well-scrubbed benches ranged along the wall behind the coverless table; a comfortable looking settle between the wall and the huge furnace-like stove reaching almost to the ceiling; a high feather-bed and a few very clumsy chairs which, like the benches, bore evidence of frequent scrubbing.

The clean sanded floor; the curtained windows and the white-washed wall adorned with a looking-glass, a picture of our Lord, another of Luther, over each of which a fresh juniper twig was nodding its silent, fragrant welcome; everything looked so fresh and bright, so plain and yet so rosy that for a moment our thoughts wandered back involuntarily to the equally humble pioneer homes of America where the light of love and liberty shed its bright rays over the bare floor and the rude, home-made furniture. And from beneath the roofs of which, the great architects and builders of the grand Republic have emerged for two centuries clad, indeed, with German simplicity but armed with the vigor of native strength and filled with the spirit of the free air, and the free soil for which alas! Germany sighs in vain. There, only love, and the contentment of spirit-resignation, can keep the hearth-stone warm.

Adjoining the common sitting-room in the kitchen, a survey of which convinced us that neither the comfort nor the ingenuity of women had been consulted in its construction. Though a model of cleanliness, it was void of every convenience. In the corner nearest the chimney is a crude elevation of stone and mortar about three feet in hight and four in length and breadth, the whole resembling a blacksmith's forge. This is the "shed" or fireplace for summer-cooking, as the large stove previously mentioned is used for that purpose in winter and is adjusted to the kitchen wall in such a manner that it can be heated from without. These stoves are large enough to hold a bundle of twigs the size of a beer keg, in addition to the pots and kettles which are conveyed to the blazing fire by means of a long pronged stick. On the upper rows of shelves which cover one side of the kitchen-wall, the cooking utensils are arranged with military precision, while the lower ones contain high, narrow jugs of milk. On a bench behind the door stands a tub of water which the women have to bring on their heads from a well about a square distant. The old-fashioned dash-churn, which is still in universal use, a basket of fir-cover and a bundle of dry twigs complete the visible contents of the kitchen. The invisible remains consist of several strings of home-made sausages and some hams hanging on beams fastened in the chimney, where the people tell their children, the chimney-sweep, of whom they have a wholesome dread, places them for all good children.

A steep flight of stairs brought us to our little room which—its high feather-bed, looking very much like a snow-covered hillock, two chairs and a small table being its sole occupants—looked a little cold and empty. But a peep through the white curtains over the gable roofs into the variegated billowy landscape, rising gradually into hills or fading in the blue horizon; the clear limpid stream rushing and leaping from the depth of a gray old forest, soon reconciled us to our new quarters. Here we would quietly and unobserved, see the people coming and going; carrying joyfully or wearily, the burden of life's harvest. And in the evening see the family groups sitting on logs before the houses, singing ballads or relating the same old legends of mysterious apparitions and haunted castles, their honest faces all the while reflecting the cheerfulness and sunshine of their green meadows, or the solemn earnestness of their forests. I have seen both characters, and for the home-sick and the love-sick recommend the former. Their very footsteps quickened your pulse. They open the door with a jerk and at once fill the room with life and laughter. You imagine every minute they are going to say something very amusing and are generally not disappointed; though, whatever they relate, the hero is invariably embodied in themselves. Their heads and arms give force to every word, and unless you are accustomed to them you wonder if they haven't got the headache, or if they are not very tired, or if their joints don't ache.

But for a quiet, confidential chat where you are not in constant dread lest your words are brewing a storm in some hot-headed enthusiast, we prefer those quiet, earnest Germans, who smoke their long pipes, listening all the while very attentively to your arguments pro and con until finished; then they carefully knock the ashes out of their pipes, lay them back in their accustomed place and in a few pithy words give you their opinion and, instead of the blustering hurricane without which the other would not come to an understanding, they quietly clear the sky of controversy with an amusing anecdote which converts everybody but themselves into laughter.

WHAT IS A "BLIZZARD?"

"THE papers want to know what a blizzard is, and they turn up their noses at the word, but them as has been thar' can't see where the joke comes in. I've shook hands with one or two blizzards, and here's the affidavies to prove it!"

He drew off his boots. Three toes were missing from the right foot, and the big toe alone remained on the left. Two fingers were gone from the left hand, one ear shrivelled out of shape, and his nose seemed to have no life in it. He was a rough-looking old chap, and he was warming his heels on the steam-pipe in the cabin of a ferry boat along with several other passengers.

"Well, what is a blizzard!" asked one of the crowd as the old man pulled on his boots.

"What's the weather here to-day?"

"Two below."

"Well, you add five or six degrees of cold to it, take off your clothes and walk around for three hours and you'll have a slight comparison. A blizzard hain't 'zactly a two-edged sword nor a bullet, but it lives next door to 'em. You'd better twice over be cotched in a tornado. I'd take the chances of outrunning a prairie fire quicker'n living through a January blizzard."

"Tell us about 'em."

"The fust one I ever seed," said the old man as he held up the stumps of his missing fingers, "war down in Nebraska, close to the west line. I had a ranche and was well fixed. The livin' room fur me and three herders was about twenty feet squar', with a big stove in the middle. On the 4th day of January, 1859, there wasn't a flake of snow on the ground, and at four o'clock in the afternoon it was warm enough to go in my shirt-sleeves. Half an hour before the sun went down the sky was clear and blue. I stood looking off at a herd of horses, feelin' as if I wanted to go bar'fut, when all to once a shiver climbed over me. It was as if ice-water had been poured down my back. Thar was a moanin', roarin' sound away to the westward, another shiver, and next minit it was dark and the blizzard had come. Quicker than I can tell you the sky turned black, night set in, and mountains of snow come boomin' along before a gale blowin' eighty miles an hour."

"Well?" said some one as the old man paused.

"Wall, there she was. That blizzard was born in the Rockies. She'd whirled around and round

gettin' stronger every minit, lifted herself out of some awful canyon, tore along the crags and peaks, and finally tumbled down on the level and started eastward, mad as a grizzly and powerful as a million runaway horses! Them threo herders waren't half a mile away, and all mounted, but yet only one reached the cabin. The other two were struck as dumb and numb as if hit with cannon balls, and they waren't out of the saddle a minit before they were covered with six inches of snow."

"Must have been cold?"

"Cold! Mabbe it wasn't! I did'nt have no thermometer to look at, but I didn't want one. Our jug of whiskey froze solid and split the jug in ten minits. Frost settled on the taller candle within an inch of the light. Every board in the ranch cracked and popped with cold. We had a big stove, but the fuel was mostly under a shed fifty feet away. I thought to go after a load, but as I opened the door I fell back as if ten thousand needles had been fired into my face. That one breath of the blizzard froze my nose and ear."

"And you were out of fuel?"

"Yes, in half an hour I burned up stools, benches, table and all else that would burn, but after midnight the fire went out. Then I lost my toes—frost bitten even when I was dancing over the floor. Ours was a tight cabin, and yet there was a foot of snow on the floor before daylight. The awful wind drove it through every crevice. Did you ever hear the gale which goes with a blizzard? Well, you'll face a cannon sooner than hear it a second time. The wind screamed louder than a locomotive whistle. It raged and raved like a giant in chains, and it struck down every living thing it came to.

All at once it would stop blowin' for half minit, and the stillness would be awful. Then I'd hear it sighin' and groanin' afar off, as if poor lost children were cryin' for home. Then the groanin' would change to a screech—the screech to a wild shriek, and the gale would whirl 'round and 'round the cabin as if bound to lift it from the earth in its teeth. The gale knocked over trees a hundred years old, and rolled rocks weighing a thousand tons down upon the level!"

"And about your stock?"

"When that blizzard struck my ranch I had 500 cattle, 2,000 sheep, and about 200 hosses, all alive and kickin.' It died away about daylight, and after an hour's work we got out of the cabin and through the snow. Far as the eye could reach all was a dead level. Gulches, ravines and dips had been filled up with from five to thirty feet of snow. Every horse, sheep and steer had gone down in his tracks to die and be coffined in white, and we two, frostbitten and frozen, were fifty miles from any white man. Don't sneer at a blizzard! You'd better meet a thousand she tigers!"

NEW PUBLICATIONS.

How to Educate the Feelings or Affections. By CHARLES BRAY. Illustrated. Price, $1 50. New York: S. R. Wells & Co., Publishers, 737 Broadway.

No subject to-day is of greater importance to our people than the cultivation of the feelings, from which character and happiness spring. The world has studied and labored in the direction of intellectual culture, and great advancement has happily been made in this field; but the systematic and properly directed culture and regulation of the propensities has received too little attention, because the public mind has not understood this part of human nature in such a sense as to be able to educate and regulate it. An ounce of prevention in the field of human depravity is worth a ton of cure in the line of imprisonment, stripes, and the halter, inflicted upon the wrong-doers. If we can educate the passions and propensities so as to make them subservient to moral and social law, we have worked toward the disuse of jails, prisons, and the gallows, and prevented the great and sad waste of human life, hope and happiness, which is so conspicuous in our day. The virtuous portion of the people must bear the expenses of crime—the thefts and forgeries are a tax on virtuous industry, and then all the cost of police, courts, jails, and prisons are a burden to be borne by the law-abiding part of mankind. For the good of those who may be saved to virtue, as well as of the virtuous, the feelings ought to be educated and brought into obedience to law and morality. To promote such ends this book is put forth. And as it is a discussion of the subject on a sound practical basis it deserves the careful examination of all who would have a better condition of affairs in general society.

Key to Ghostism. Science and art unlock its Mysteries. By REV. THOMAS MITCHELL, author of "Philosophy of God and the World," etc. 12mo, pp. 249. Cloth, price $1.00 New York: S. R. WELLS & Co., Publishers, 737 Broadway.

THE literature of the day is not wanting in attempts to refute the philosophy and to expose the arts of Spiritualism. Some writers have devoted much time to analyses of the peculiar mental condition of the multitudes who are more or less taken in the toils of this belief, and have given to the world treatises which are more distinguished for profundity of reasoning than for clear and practical teaching on the subject. Mr. Mitchell strikes at the root of the matter in the outset by imputing the existence of Spiritualism to man's love of the marvelous. As a preliminary to the special treatment of his subject he analyzes the nature of mind, showing its relation to the body and the laws of its exercise. This part of the work helps, in itself to clear away much of the obscurity which to the uninstructed eye envelopes Spiritualism. Proceeding next to discuss the subject proper of his book, Mr. Mitchell draws largely from the avowals of "mediums," and of men and women who have been engaged in practicing upon the credulity of the public for gain. He shows how science and invention are made subservient to deceit—how magnetism, electricity, and prestidigitation may overawe the ignorant and superficial. Appreciative of the influence of the late book published by Mr. Kiddle, he devotes some space to its particular consideration, and there wields a vigorous pen. Further, he has given much time to personal investigation, and gathered evidence from all sources of authority, and produced a book which is full of interest to the reading and thinking community.

"THE LITERARY REVOLUTION."—The success of the unique enterprise, which has earned the above title, has hardly a parallel in literary history. Started but little more than a year ago, with one book and one printing press, it already rivals, in magnitude and number of thousand volumes manufactured daily, the oldest and largest publishing houses of the country.

The publications are all of a high order of literary merit, clear in print, on good paper, in neat, strong binding, such as lovers of books who value contents rather than covers, and wish a little money to go a long way will desire. Prices are held so very low, so greatly in contrast with prices generally, that many people have naturally doubted the responsibility of the publishers and even the possibility of making good books at such a small cost; the possibility seems to be demonstrated by the large list of standard books already published and sold in large editions; the responsibility of the AMERICAN BOOK EXCHANGE is unquestioned. Whoever sends money to them need have no fear but he will get promptly all they promise to send in return.

J. B. LIPPINCOTT & Co., of Philadelphia, announce that an entirely new and thoroughly revised edition of their invaluable "Gazetteer of the World" will be issued towards the close of this month. A competent editorial corps has been engaged for the last five years on the work of revision.

MAGAZINES FOR MARCH.

HARPER'S MAGAZINE.—Contents: The New School of Italian Painting and Sculpture, J. J. Jarves, Illustrated; Isis, a poem, Frances L. Mace; Among the Arrapahoes, Lieut. H. R Lemly, U. S. A., Illustrated; "Pinafore's" Predecessor, J. Brander Matthews; Obstinacy, a Musical Adventure, Charlotte Moscheles, Illustrated; A Winter Idyl, William Hamilton Gibson, Illustrated; Dakota Wheat Fields, C. C. Coffin, Illustrated; Valentine, a poem, Philip O. Sullivan, Illustrated; An Irish Wake, J. L. Cloud, Illustrated; Vacation Aspects of Colorado, A. A. Hayes, Jr., Illustrated, White Wings a Yachting Romance, William Black; Miss Beulah's Bonnet, Rose Terry Cooke; Transportation by Railway and Ship Canals, E. H. Derby; The Sifting of Peter, a Folk-Song, H. W. Longfellow; Karin, a Romance of Swedish Life, Z. B. Gustafson; The Snow-Messengers, a poem, Paul H. Hayne; Mary Anerley, a novel, R. D. Blackmore; The Preservation of Hearing, Samuel Sexton, M. D.; Honoria, a poem, James T. Fields. Editor's Easy Chair. Editor's Literary Record. Editor's Historical Record: Political: Disasters, Obituary. Editor's Drawer.

THE SIFTING OF PETER.—A FOLK-SONG.

"Behold, Satan hath desired to have you, that he may sift you as wheat."—ST. LUKE XXII, 31.

In St. Luke's Gospel we are told
How Peter in the days of old
Was sifted;
And now, though ages intervene,
Sin is the same, while time and scene
Are shifted.

Satan desires us great and small,
As wheat, to sift us, and we all
Are tempted;
Not one, however rich or great
Is by his station or estate
Exempted.

No house so safely guarded is
But he, by some device of his,
Can enter;
No heart hath armor so complete
But he can pierce with arrows fleet
Its center.

For all at last the cock will crow
Who hear the warning voice, but go
Unheeding,
Till thrice and more they have denied
The Man of Sorrows, crucified
And bleeding.

One look of that pale, suffering face
Will make us feel the deep disgrace
Of weakness;
We shall be sifted till the strength
Of self-conceit be changed at length
To meekness.

Wounds of the soul, though healed, will ache;
The reddening scars remain, and make
Confession;
Lost innocence returns no more;
We are not what we were before
Transgression.

But noble souls, through dust and heat,
Rise from disaster and defeat
The stronger,
And conscious still of the divine
Within them, lie on earth supine
No longer.

—H. W. LONGFELLOW, in Harper's Magazine for March.

THE ATLANTIC MONTHLY FOR MARCH, 1880.—Contents: Reminiscences of Washington, II, The John Quincy Adams Administration, 1825-1829; Pepita, Thomas Bailey Aldrich; Accidentally Overheard, Horace E. Scudder; Flowers in the Dark, Sarah O. Jewett; Egypt under the Pharaohs, Francis H. Underwood; Some Intimations of Early Childhood, Mrs. Edward Ashley Walker; Areopagus; The Undiscovered Country, VIII-XI, W. D. Howells; New Year Song, Celia Thaxter; Literary and Philological Manual; Her Shawl, Oscar Leighton; Hannah Dawston's Child, Lucy Lee Pleasants; English in England, Richard Grant White; Helen's Cup, Louise Chandler Moulton; The Memoirs of Madame de Remusat; A German Agitator and a French Dilettante; Washington Irving, Charles Dudley Warner; The New Departure in the Public Schools; Prisons and Penitentiaries; The British Civil Service; The Contributors' Club; Publications Received.

GENTS.

One day, several years ago, when I was rather a young man, the editor of one of the great New York dailies, for which I was doing occasional articles, called me into his sanctum. He held a manuscript of mine in his hand, and on his countenance was an expression which I hastily and inaccurately translated into "declined with thanks."

"I notice the word *gent* here," he said, thoughtfully tapping the paper with his forefinger; "have you spelled it correctly?"

"Haven't I spelled it *g-e-n-t*?" I asked in astonishment.

"I believe so; but won't you have the goodness to look it up in the dictionary?"

I turned confidently to Webster's Unabridged, and presently became rather red in the face at not being able to find the word in that bewildering store-house.

"Perhaps there is no such word in the English language," slyly suggested the editor; "in which case we had better strike it out of the article."

This little lesson made so deep an impression on me, and instilled into my heart such a hatred of the word *gent*, that I believe if I were naked and starving I would refuse to be clothed gratis at a "Gents' Furnishing Store," or accept a complimentary dinner in a "Gents' Saloon." Mr. Richard Grant White wittily remarks that "gents" and "pants" belong together, for the former always wear the latter. If "gent" is to be tolerated by careful writers, then let us accept "pants" for trousers, "transpire" for happen or occur, and, in brief, adopt all the variegated and wonderful vocabulary of the average newspaper.

The word "gent," however, does describe a class. When you see a greasy young fellow who seems a cross between a rustic and a negro minstrel off duty—a person with cap set far back on his closely cropped head, tight trousers that grow suddenly full at the ankle, and shoes with turned-up, pointed tips (where does he get those shoes!)—when you see this vulgar little object, you see "a gent." You will encounter him on street corners in shabby neighborhoods, gazing admiringly at the lithograph of some famous clog-dancer or cheap blonde in a drinking-shop window; you will meet him there, but Heaven preserve you from ever meeting him in decent literature!—*Atlantic.*

LIPPINCOTT'S MAGAZINE opens with a description of the Lakes of Minnesota, with their healthful and picturesque summer resorts, which are already much frequented by Northern tourists, and which, judging from this article and its attractive illustrations, deserve to be better known. There are two other illustrated papers in the number,—the IXth Chapter of Dr. Oswald's "Summerland Sketches," which treats of Yucatan, and the conclusion of Edward King's account of "Old and New Rouen." "The American Suez" is the title of an article which will be read with special interest. Another timely paper is devoted to the "Ute Matter," "At the Foot of the Sierras" contains some capital sketches of life and manners in the most beautiful regions of the West. The well-written and suggestive description of "Decorative Art and its Dogmas," by M. G. Van Rensselaer, is concluded in this number. There is a fresh instalment of "Adam and Eve," by the author of "Dorothy Fox;" a very pathetic and realistic story, entitled "A Mother's Vision," by Sarah Winter Kellogg; and a bright little Italian Sketch, by the author of "Signor Monaldini's Niece." "Playing a Part," by J. Brander Matthews, is a witty and neatly-constructed comedy, well adapted for amateur acting. The poetry is by Paul Hayne and Howard Glyndon, and a large space, as usual, is devoted to the "Monthly Gossip" and the "Literature of the Day."

ST. NICHOLAS contains Alfred Tennyson's Child-Song, "Minnie and Winnie," set to music, and Mrs. Alfred Tennyson's revised score of the music for the Laureate's other St. Nicholas song, "The City Child."

"The Disadvantages of City Boys," by Washington Gladden, appears in this number. It is based on actual facts, and is a stirring talk with boys on a subject of vital interest to them. They will find pleasure, too, in the seasonable "Out-Door" Paper, "Kite Time," by Daniel C. Beard, which gives diagrams and full instructions how to make and fly kites of all sorts and shapes.

Among the short stories are "Chy Lung," an illustrated tale about a Chinese fisher lads' curious adventures; "Buttercup Gold," by Laura E. Richards, telling how a little girl found gold through boiling buttercups; "The Tea-Kettle Light," with a picture by A. C. Redwood, a true account of how a New England boy made illuminating gas from birch bark.

Of the two Serials, the installment of Louisa M. Alcott's "Jack and Gill," with two fine pictures by Dielman, brings its young people into a peck of troubles; and William O. Stoddard's "Among the Lakes," illustrated by Taber, tells how its boys and girls enjoyed themselves in an old farm-house.

A commander of the U. S. Navy, with the aid of pictures by R. Riordan, describes the "Gathering of Caoutchoue in Nicaragua;" and John Kieler, in an article entitled "Longitude 180 degrees," explains how travelers lose a day in going to China from San Francisco and gain a day on the return voyage.

One of the striking illustrations is a portrait of "Babie Stuart," the infant daughter of Charles I., engraved by Muller after the painting by Vandyck.

The Departments "For Very Little Folk," "Jack-in-the-Pulpit," "Young Contributors," "Letter-Box," and "Riddle-Box," have varied and lively items, some from the boys and girls themselves.

GOOD COMPANY NUMBER SIX, is as usual rich in stories. They include Better Times, Ellen W. Olney; Cousin Seraphina, by Sydney Hall; Aunt Hetty's Story, by Mrs. E. D. R. Blanchard; and Old Barry's Son. There are these sketches:—The Threshold of the Gods, by Maurice Thompson Little Traveler, by Miss S. O. Jewett, author of Deephaven; and After Fifteen Years.

The writer of Acer Saccharinum has a charming article, Snow Pictures. Austin Bierbower sets forth with much distinctness the fundamental differences of the Republican and democratic parties. There is a careful account of the treasury department, and its present head, Hon. John Sherman, by "David Copperfield." Mr. G. M. Towle's biographical sketch is about Victor Hugo.

There are also The Indian as he Used to Be, Roman Mosaics, Adam and Eve; and poems by Mrs. Wyeth, and Herbert Hall Winslow, the young western poet whose creditable work is to some extent familiar to the public; also the editorial departments.

VICTOR HUGO'S OLD AGE.—It is pleasant to think that the green old age of this master spirit of literature, this man who is renowned alike as a poet, a novelist, a dramatist, a philosopher, an editor, and an orator, who has worked so splendidly in the cause of the lowly, who has given forth ideas that will surely live, who has uttered truths which must make men better as they spread, and who has shown in his own noble, unselfish, fruitful life, what good things are temperance, benevolence, and self-sacrifice—it is pleasant to think that his green old age is being passed in the Paris he so dearly loves, and amid the scenes of all his triumphs; that he may contemplate, with serene delight, the founding of a French Republic likely to endure, and may himself sit as a life Senator of France among its grave counselors.

Victor Hugo has never affected the roughness of life and dress, and vulgar familiarity of manner, by which the demagogue sometimes seeks to gain favor with the multitude. He has always lived like a gentleman and a scholar. His house has always been the center of elegant literary reunions; his chosen companions have been men of culture and intellect. His modest though cozily garnished house in the Rue Clichy has become, since the return of the great exile, the center of frequent political and literary receptions, at which the first minds in France have gathered to discuss measures and books. Thrice in three years the shadow of death fell upon his house, depriving him of a faithful and beloved wife, and two sons on whose future he had rested the most sanguine hopes; these great griefs passed, and left the grand old man sadly serene; for he believes in a future life with all his soul, and knows that ere long his own summons must come to rejoin them. No one can approach him without being irresistibly attracted by his beneficent face, his big, kindly glowing eyes, his cordial, almost affectionate warmth of greeting. To every one alike he is approachable, genial and talkative. As his sympathies reach down to the humblest, so his bearing with all men is outwardly fraternal. What he is in his books, he is in his daily walks; and one has only to read them, to derive an excellent idea of his conversation. It is sparkling, epigrammatic, flowing, full of warmth and feeling, accompanied by expressive action of the features and the hands. He is ready and glad to talk about everything, and amazes by the extent of his erudition, especially in common things. He is easily aroused to a long and brilliant monologue by the introduction of a subject that especially interests him. He never tires of declaiming—for it is declamation—about the hopeful outlook for the Republic; about the enormity of the *coup d'etat;* about the necessity of abolishing, by the spread of knowledge, all crime, war, and poverty. His ideas naturally take poetic and grandiose forms as he warms to his theme. He quotes freely from his own works, with graceful apology; and there is throughout an air of what would be called vanity in a lesser man, but which in him is warranted by the consciousness of his pre-eminent fame, and of the admiration of all the world.—*Good Company.*

BRIC-A-BRAC.

AN art exhibition: "That picture of X's is a fearful daub, don't you think?" The gentleman addressed—"I beg your pardon, but I am the artist." "Oh, I beg ten thousand pardons. The fact is, I don't know anything about art—I just repeat what I hear every one saying.—Art Journal.

A MAN bought a horse. It was the first one he had ever owned. He saw in a newspaper that a side window would make a horse's eye weak on that side; a window behind him would make him squint-eyed; a window on a diagonal line would make him shy when he traveled; a window in front would hurt his eyes by the glare; and a stable without a window would make him blind.

"AMAZING GRACE."

THE following is vouched for by one of the most reliable of Philadelphia divines:

A young clergyman having agreed to supply the pulpit of an older brother absent from home, escorted to church the daughter of the pastor, and after seeing her safely in her father's pew, ascended to the pulpit, unconscious that this natural attention to the young lady was sufficient to excite lively imaginations and inquiries in the audience.

Upon reading the hymn to be sung, the young clergyman was surprised to perceive evident efforts in the congregation to suppress laughter. The daughter of his friend possessed the mellifluous name of Grace, and, all unsuspicious of that fact, he had chosen the hymn beginning with the words "Amazing grace," and proceeding with:

'Twas grace that taught my heart to fear.
And grace my fears relieved.
How precious did that grace appear.
The hour I first believed?

Through many dangers, toils and snares
I have already come;
'Tis grace has brought me safe thus far,
And grace will lead me home?

[*Harper's Magazine for January.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

SMALL FRUITS FOR THE FAMILY.

E. K. B.

THIS is the time of year when farmers are planning what their work shall be for the coming summer, and already each field has an imaginary crop growing upon it; but how few include a plot for small fruits when laying their plans for the future. It seems strange, yet it is true, that farmers, as a rule, enjoy fewer of earth's bounties in the form of a plentiful supply of small fruits, than do many of other callings; and yet they of all others could have them with least trouble and expense.

In the city there are always the markets. In the village there are often fruit peddlers who drive from door to door, but seldom is there one who goes through the country to isolated farm-houses. They probably think it would be "carrying coals to Newcastle" to take fruit into the country; but they would find it quite the contrary. As far as my observation has gone, not one farmer in ten raises his own strawberries, to say nothing of other small fruits. What can I say to lead them to a better enjoyment of the fruits of their land? If the story of our pleasant experience in the culture of small fruits shall lead even one other family to go and do likewise, then shall I consider that the time I spend in writing this does not go unrewarded.

Ten years ago when my husband's failing health drove us from the city, we bought a farm in the hope that out-door life and a plentiful supply of fresh fruits would drive away impending invalidism. But we soon found our supply of fruit was limited to certain months of the year, and that during the summer our only supplies, until apples ripened, must come from three "old-fashioned" English cherry trees and a few straggling raspberry and currant bushes. These, with a dozen forlorn, scrubby dwarf pear trees not in bearing, and a good apple orchard, constituted our stock of fruit. Two big Lilacs, two clumps of Pæonies and a Cinnamon Rose-bush formed our list of ornamentals. But we soon changed all that. The thought of owning land and going without strawberries was an intolerable one to me, and the first spring after coming here I set with my own hands (because, though far from idle, they were the least busy hands in the family just then), a Wilson strawberry bed a few feet square. The next year we had all the strawberries we could use, and we have never been without them since, but, of course, the bed has been renewed. The Wilson is still our favorite, although my husband whose sweet teeth are innumerable, prefers a sweeter berry, and in his search for one has tested several other varieties.

We have added to our stock of fruits from time to time by purchase and propagation, until now we have of small fruits, blackberries, raspberries, gooseberries, currants and grapes, all of choice varieties. Nor have the larger fruits been neglected; and we can "point with pride" to our growing peach, pear, cherry, plum and apple trees and say, "All these are the work of our hands." On counting up I find that the aggregate of varieties that we have planted amounts to over seventy-five, and yet we have not made any great outlay of money. Our purchases having been made directly from the nurseryman, we have got much better terms than if we had dealt through agents.

Our fruit is nearly all in bearing now, and it would be hard to describe our delight in the enjoyment of a succession of delicious fruits through the whole summer. First come strawberries, which begin ripening the middle of June, and by having early and late varieties, their season is much prolonged; before they are fairly gone the raspberries, cherries and currants are ready for use, followed in rapid succession by blackberries, grapes, peaches and pears. Last summer we had fresh berries on our table from the middle of June until the first of October; and, incredible as it may seem, but probably owing to the very warm weather that month, I picked several clusters of large, beautiful Kittatinnies on the 28th of October with which to decorate the wedding supper-table of a friend.

We do not purpose to raise small fruits for sale, but we do intend to have an abundance for our own consumption; and one-fourth acre devoted to their culture gives us such overflowing measure that every year there is a surplus of nearly every fruit we raise, for which we find a ready sale among our less favored but wealthier neighbors, whose daughters gladly come and pick our fruit for a share. Indeed, they tell me that they can with greater ease and more profit pick the fruits in our garden for a small share than to search through the woods and tangled brush-heaps for wild ones. We reduce the work of raising them to a minimum by setting our plants in long lines between the rows of young fruit trees, so that a horse and cultivator may as readily be driven between as through the rows of a corn-field. Treated in this manner but little hard labor is required and the young trees are also greatly benefited and kept in a thrifty condition by the frequent stirring of the soil.

Cayuga Co., N. Y.

IT DON'T PAY.

I DO NOT know why Mary Wager-Fisher or any other lady should wish to expend her "spare can money" upon cans either of glass or tin, for the preserving of tomatoes, when one can purchase them of good quality for eight or nine cents per tin quart can. I do not believe "it pays" to do them up at home. The cans cost as much or more than the above price without the tomatoes, and, although it is true that they can be used more than one season, I have found by experience that the best of glass cans can not be made air-tight enough to keep tomatoes in, without the buying of new rubber rings or metallic bands, after two or three years' use. With the labor of preparing the tomatoes, the heating of one's-self over a hot fire on an August day, and the possibility of failure, where the housewife has only for her time, labor and money a quantity of acid or worked tomatoes which no amount of sugar or soda can render palatable, it seems to me but a "penny-wise-and-pound foolish" kind of domestic economy to do up your own tomatoes whether in glass or tin.

Atkins, Mich. MRS. A. B.

TOMATOES IN STONE JUGS.

I THINK stone jugs are preferable to glass or tin for preserving tomatoes in. Although they cost more in the first place than glass, they will last a life-time with any reasonable usage. I prefer those holding two quarts or a gallon. With us, tomatoes are used as freely as potatoes, and I have frequently done up 30 or 35 gallons in a season. The tomatoes are cooked 10 or 15 minutes, salted, skimmed and put through a funnel into the jugs, which are first rinsed in hot water. Secure with good corks and a cement made of two parts resin to one of beeswax. MRS. L. E. R.

HOUSEHOLD HINTS.

To Wash Mourning Calico.

PUT the dress into a boiler half full of cold, soft water; place on the stove and when the water becomes as hot as you can bear your hands in it, wash out the dress. Use hard soap. Rinse thoroughly and in the last water put in bluing and a little dissolved glue. Do not use *milk or salt-and-water* for calicoes.

To Wash Flannels.

I use my wringer to wash woolen blankets and stockings. Make a strong soap-suds with boiling water and wring them through five or six times. Then rinse through two clear hot waters, the last one well blued. I have washed flannels, both colored and white, in this way for the last twenty-five years without "fulling." To prevent the edges of cotton or woolen sheets from curling, pass the selvedge edge of the sheet into the wringer instead of the end.

That Sausage Recipe.

The recipe for sausage in RURAL of Feb. 14, is a good one except the adding of water. Instead of water add a pint of molasses and a pint of flour. Put the meat with all the seasoning into the wash boiler (I have one that leaks which I use for this purpose); stand on the stove and mix *thoroughly* until the juice has set. Then put in bags made of cheese cloth one yard long—one width will make four bags. Suspend from the ceiling in a cold place where they will freeze.

Lime in Tea Kettles.

One or two clam shells kept in the tea-kettle, will prevent the lime from forming on the sides of the kettle. I always turn a clam shell over the drain hole in the bottom of my flower pots, to prevent the earth washing into the saucers.

Sponge Cake.

Four eggs; two cups sugar; two cups flour; (after it is sifted); half cup cold water, juice; and rind of one lemon; one teaspoon cream-of-tartar and one-fourth teaspoon soda. I proceed to make the cake in this way: Break the eggs—whites on a plate and yelks in a bowl. Beat the whites stiff, as for frosting; stir in the sugar and beat well for five minutes; next beat the yelks, and stir in; then put cream-of-tartar and soda in the water, stir and mix thoroughly. Add the flour, then the juice and chopped rind of lemon; have your tin lined with buttered writing paper and bake. I have used this recipe a good many years, and always have good cake.

MRS. C. F. REYNOLDS.

Trees, Seeds, Plants, &c.

VICK'S Illustrated FLORAL GUIDE

A beautiful work of **100 Pages, One Colored Flower Plate, and 500 Illustrations**, with Descriptions of the best Flowers and Vegetables, and how to grow them. All for a FIVE CENT STAMP. In English or German.

News of the Week.

MISCELLANEOUS.

Monday, March 15, 1880.

On the 13th inst, the schooner Alaska, Captain McKenna, left San Francisco for the Artic seas. She went farthest north last year, and was last to leave in returning. Papers and correspondence have been sent by her to the commander of the Jeannette, which he possibly may receive. It is singular that those interested in the welfare of the crews of the Mount Wollaston and Vigilant when asking the Government to send a vessel to their relief, sent nothing by the Alaska, the first outgoing vessel.

Dennis Kearney and his followers have caused much trouble in San Francisco for some time past. California has adopted a constitution which prohibits the employment of Chinamen. Moreover, the San Francisco Board of Health has pronounced Chinatown, that part of the city occupied by the Celestials, to be detrimental to the public health. On the strength of these facts Kearney has allowed his eloquence free flow, advocating instantaneous and violent ejection of the Chinese, and inflaming the workingmen against the bloated capitalist. Many times has the city trembled under the apprehension of riots and disorders. These have, however, been staved off by the firm attitude of the better class of citizens. A large number of citizens representing the wealth, respectability, and decency of the city have formed an organization styled the Citizens' Protective Union. Their object is to support the constituted authorites in maintaining order. Mayor Kalloch, who was elected by Kearney's clique, sympathizes strongly with his constituents, but the Protective Union threatens him with impeachment if he favors their measures. Thus the matter stands at present....The Herald Relief Fund for the Irish famine has now reached the sum of $290,527.75 ... On the morning of the 10th inst. an elephant was born at the winter quarters of Messrs. Cooper, Bailey & Co.'s London Circus, in Philadelphia. It is an unusual occurrence for an elephant in captivity to bring forth young, hence the advent of this baby has excited some interest. The baby weighs 213 pounds, stands 30 inches high and is 35 inches long. The mother is 23 years old....An attempt was made to assassinate Mayor Baxter, of Louisville, Ky., on the 13th inst.; he escaped unhurt. The would-be assassin is a worthless character named Sam Redd, who had been discharged from the street cleaning department for drunkenness. He is now in jail....At Middletown, N. Y., five women were recently elected school trustees ... Captain Eads, the famous engineer who has so effectually opened the outlets or the Mississippi, proposes to build a ship-railway across Central America instead of a canal. He has entertained Congress with a long report of his plans....

The Atlantic and Great Western Railway Company is to be consolidated with the company of the New York, Pennsylvania and Ohio Railway. General J. H. Devereux, receiver of the Atlantic and Great Western road, will be president, and P. D. Cooper general superintendent.....A none sectarian religious organization, named the Salvation Army, which was organized in London a few years ago, has sent a division of missionaries to this country to fight sin and unrighteousness. The division consists of one general and seven subordinate officers, the latter being all ladies. Each wears a cap with a red velvet band on which the words "Salvation Army" are embroidered. They have begun work in the New York saloons, and have so far met with but indifferent success.....

Petitions are now being circulated in different States and Canada addressed to the Legislature of New York and to the Government of the Dominion in favor of the International Park at the Niagara. Any petition that costs nothing to sign is exceedingly popular....A few months ago a five-cent coffee house was opened in San Francisco. A cup of coffee and a roll of bread are given for a nickel. This institution was so well patronized that the other day the fifth establishment of the kind was started. These coffee houses are no doubt a great benefit to the wandering poor.... Recently there has grown up in large cities quite a business in cutting images in ice for evening parties. It is a big thing on ice. These ice figures are generally used for holding raw oysters, and the oysters have no difficulty about keeping cool in them. Ice dishes are also made for holding fruit. In Philadelphia one ice sculptor uses nearly 4,000 pounds of ice a week in this way. He makes Atlas with the globe on his back, the globe being hollow to contain the oysters, and charges from $2 to $5 for this cool mythological gentleman, globe and all. A very popular image is an elephant with an oyster dish on his back.

AGRICULTURAL NEWS.

The shipments of live stock and fresh meats from the United States to Europe have received a sudden impetus, those of last week being the largest in any week for more than a year. The steamer Thanemore, which sailed for England Saturday, had on board 540 live cattle, which is the largest shipment of live cattle on any one steamer since January 1. The total shipments last week were 1,908 live cattle, 4,308 quarters of beef, 1,700 carcasses of mutton, 50 live sheep and 550 hogs. .....The many friends of Wm. J. Walker, Esq., will be pleased to hear that he has again taken his old position of General Eastern Agent for the Gale Plow Co, with Headquarters at Rochester, N. Y. .....The Supreme Court of Michigan has awarded the perpetual injunction against the Three Rivers Plow Co. and in favor of the Gale Plow Co., protecting them in their patent "Improvement in Plow Jointers."

America imported from Europe last year 29,642,396 gallons of wine, an increase over the importation of 1878 or nearly 15,000,00 gallons.....

Italy is now importing foreign cereals at the rate of three hundred and sixty thousand tons per year, its own agricultural products being insufficient..... An Iowa woman examined a straw cutter in a hardware store, and she has just recovered $500 damages for the loss of two fingers, on the ground that the machine was not labaled "dangerous".....The open stock ranges of Banda Oriental are being largely inclosed by wire fences and 75 per cent. of the herdsmen are consequently thrown out of employment and threaten to become cattle thieves... .Grazing lands in Paraguay are selling for from $1,000 to $1,500 per league.....An ambitious Texan boasts that he has a three-year-old bull that'll whip any "bull" the Pope can produce ....Our mean average yield of wheat for 10 years has been 12.2 bushels; our highest average was 1877, 13.9; our lowest in 1866, 10.4 bushels.....In Ireland in 1874, the average number of acres per holding was 29; and the number of farmers, graziers, laborers and male and female servants per 100 acres cultivated, was 5.3....In Indiana the prospects for an excellent wheat crop are fine on all underdrained land.... The rates on grain from Cincinnati to Eastern points have been reduced as follows: On grain to Boston, 35½c. per 100 pounds; New York, 30½ cents; Philadelphia, 28½ cents; Baltimore, 27½ cents: on flour per barrel to Boston, 71 cents; New York, 61 cents; Philadelphia, 57 cents; Baltimore, 55 cents. The reduction took effect March 1, and will not affect any class of freights except as above. A corresponding reduction has also been made at other Western points to the Eastern cities... .The lovers of genuine Havana tobacco will have to prepare for higher prices The crop of 1878 was not prolific, that of 1879 was greatly delayed, and that of 1880 suffers thus far from excessively dry weather.... Rot or "bane" among sheep is playing havoc in various parts of England. In Somerset 5,000 are not left in one district which usually winters 50,000....The cattle plague is increasing in Cyprus...

Heavy exports of seed potatoes for Ireland are expected. In many parts of this State our "exchanges" say potatoes are selling at 25 cents a bushel Mail advices from Adelaide, South Australia, of Feb. 14, say that 400,000 tons of breadstuffs will be available for breadstuffs, and freights that were thought high at 50s. per ton, have gone up to 60s....It must be remembered that the seasons in Australia are about just the reverse of those here—winter north of the equator, is summer south of the line. In that continental island a great number of new agricultural settlements are being opened, and a large increase is expected during the next twelvemonth ....The city editor of a non-agricultural paper has "come out strong" in London—the Daily Telegraph, in an obituary notice of the late Mr. McCombie, the celebrated breeder of polled cattle, describes him as watching with delight "his *horned* beauties"!....The Booth Memorial Fund raised to commemorate the memory of the late T. C. Booth, the famous Short-horn breeder, of Warlaby, amounts to only $11,500, the interest on which is to be devoted to the education of his "direct descendants."....On an area of 2,746,418 acres of land in Ireland, where the average size of holding is 17¾ acres, of which 10¾ acres, or about three-fifths, are grass, there are 27 cattle per 100 acres. On an area of 4,853,982 acres, where the average size of holding is 38 acres, or nearly two-thirds, is in grass, being only a slighly larger proportion than on the small farm area, there are 25 cattle per 100 acres; which amounts to about the same cattle stocking. In sheep the small-farm area has 22½ head per 100 acres; but the large-farm area 30⅗ head per 100 acres, or about one-third more. And in pigs, too, the large-farm area exceeds, having 9¾ per 100 acres, while the small-farm area has 7½ per 100 acres....

The French journal *L'Industree Laitiere*, remarked in a recent issue that 1879 will be deservedly known as the "year of deficits." The crops appear to have been bad nearly everywhere throughout France. The yield of wheat was 82,000,000 hectolitres (a hectolitre is 2.5-6 bushels), the grain being generally of a bad quality, while 100,000,000 hectolitres are wanted for the ordinary requirements of the country. The rye crop is short by 10,000,000 hectollitres; barley has not been altogether deficient in quantity, but the quality is very poor, for it was spoiled by rains, and Indian corn was badly affected by extremes of wet and heat. Oats alone, of all the cereals in France, gave satisfactory returns. Forage crops and pastures were likewise badly injured. The hay crop was short, and, from exposure, lost in quality; half of the Lucerne crops was never got in. Potatoes rotted to the amount of 50 per cent., which is a serious hardship to the poor people of France, and, just at this time, especially so. The French beet root sugar industry suffered by a deficit of more than 25 per cent. and the vintage of the country barely reaches 25,000,000 hectolitres as against an average of 60,000,000 and upwards—a result due to phylloxera and frosts of unusual duration. The French fruit crop suffered greatly, apples, peaches, pears, and plums being almost altogether wanting. The year 1879 was, as appears from the record, as consistent in its disastrous effects upon the agriculture of France as in England, and to a less extent the same condition of things prevailed in most of continental Europe. ....According to the Mark Lane Express of March 10, the weather for the previous week had been favorable. A considerable area of spring grain had been sown early and a favorable seed-time seemed likely to be secured. The autumn-sown wheat presented a generally satisfactory appearance, as also did the pastures. The offerings of home-grown wheat at the country markets were generally scanty, farmers having been occupied with field work. The imports of foreign were fairly liberal. Opinions relative to the course of prices in the immediate future are pretty equally divided, the chief interest centering upon this country. Very little business was done in wheat for arrival, despite the more accommodating disposition of American holders. Australian was pretty freely offered at reasonable prices. Maize was in very limited demand, and unaltered in price. The sales of English wheat last week were 29,530 quarters at 44s. 7d. per quarter, against 44,491 quarters at 39s 1d. per quarter for the corresponding week last year. The imports into the United Kingdom during the week ending Feb. 23th were 776,134 hundred weights of wheat and 147,678 hundred weights of flour.

THE EYE-OPENER.

We have received from our friends in several parts of the country a number of circulars signed. N. J. Mayes & Co., Sweetwater, Tenn., offering on favorable terms a recipe for making sorghum sugar, several kinds of spring wheat, tomatoes, corn, etc. From the wording of the circulars and the manner of conducting the business we suspected the firm to be a humbug, and a letter just received from a thoroughly trustworthy person in that neighborhood leaves no doubt about the correctness of our surmise. "No such circulars are ever sent out in this neighborhood," our correspondent says, "and of course the thing is a humbug."

Distance all Competitors.

The dairyman who uses Gilt-Edge Butter Maker will increase his product six per cent., improve its quality 20 per cent., and distance all competitors who do not use it. 25 cents' worth of the powder increase product and market value of the same $3. Can you make a better investment? Sold by grocers, druggists and general storekeepers. Send stamp for "Hints to Butter-Makers." Address Butter Improvement Co., Buffalo, N. Y.

Burnett's Cologne received the highest award at the Centennial Exhibition. It is filled in elegant bottles, and is for sale by all first-class Grocers and Druggists.

For an Irritated Throat, Cough or Cold, "*Brown's Bronchial Troches*" are offered with the fullest confidence in their efficacy. They maintain the good reputation they have justly acquired.

FORRESTER'S COMPLETE MANURES.

Prepared under the formula of Geo. B. Forrester by H. J. Baker & Bro., New York, have given great crop results to the farmer. They furnish plant-food in the correct proportions to the plant, and are prepared on scientific principles. The results have been, per acre, 400 bushels of potatoes; 1,000 bushels of onions; 985 bushels of turnips; 75 bushels of oats, and very large crops of cabbage. The Potato Manure has been used five successive years on the same piece of ground, and the same manure and crop will be in the identical acre this year, showing that chemicals will keep up the fertility of the land as well as stable manure. Our readers will find much interest in the circulars issued by this firm.

The Markets.

SPECIALS FROM ALL CENTERS.

Until Saturday, March 13.

Baltimore.—Wheat—Southern red at $1 38@$1 42; do. amber at $1 45@$1 48; No. 1 Md. at $1 46; No. 2 Western winter red, $1 44½; Corn—So. white, 58c; do. yellow, 56@57; Western mixed, spot, 56½@56 ½c. New Orleans.—Corn quiet at 56@58c. Oats steady at 45@46c. Corn meal dull at $2.45 Hay steady: prime at $22@23; choice at $25. Pork quiet at $12.75@13. Lard steady; refined tierce at 7½c. keg at 8½c. Bulk meats steady, with a fair demand; shoulders, loose at $4.25; packed, $4 40; clear ribs, 6½@7c; clear sides at7@7½c. Bacon dull, shoulders 5½@5¾c.; clear ribs 7½c.; clear sides at 8½@8¾c. Sugar cured hams dull; canvassed at 8¾@10c. Cotton quiet, easy; middlings 13c.; low middling 12⅝c.; good ordinary, 12½c.

Weekly—Net receipts 28,089 bales; gross 30,489; exports, to Great Britain, 15,991; to France 13,061; to the Continent 17,222; coastwise 2,500; sales 3,600

Philadelphia.—Wheat active—Western rejected on track at $1 41; mixed in elevator at $1 42; Penn red on track at $1 44½; Southern amber at $1 46½; No. 2 red in elevator at $1 44½; the cargo rate for No. 2 red is $1 45½ free on board. Rye scarce; Penn. 92@93c. Corn—Penn. and Southern yellow on track and in grain depot, 55@55½c.; Western yellow on track, 55c.; Western mixed on track and in grain depot, 54½c. Oats—More inquiry; mixed at 45½c.; No. 2 white at 48½c.; fancy do. at 49c. Butter firm and fairly active; creamery extra at 35@37c; Bradford county and New extra at 27@28c.; Western Reserve extra at 27@28c.; do. good to choice at 24@26c.; rolls wanted; Penn. extras at 22@23c.; Western Reserve extras at 23@25c. Eggs firm; Penn at 13c.; Western, 12½@13c. Cheese steadily held; New York factory at 14½@14½c; Western full cream, 14@14½c.; do. good, 13½@13½c.; do. half skims, 12@13c. Poultry—Live chickens at 9@10c., as to quality; do., turkeys, at 10@11c.; dressed dry-picked chickens, 9@11.; turkeys, choice, light, 13@14c. and common to good do. at 10@12c. Feed—Sales of 40 tons prime winter wheat bran, in store, at $21 50, with choice flaky lots quoted at $22 on the spot, and running lots of prime at $21. Seeds—Clover was in full supply and easier, under a slow demand at 7@8c. for fair to prime. Timothy was quoted at $3.15@3.35 for round and jobbing lots, as to quality, with sales of 100 bags at the inside rate. Flax was scarce, and if here could have been placed at $1 85@1 90. Wool—Col. fall, 32@34c.; 70,000 lbs. English combing at 55c.; 30,000 lbs. Canada combing at 52½c.; 25,000 lbs. unwashed combing at 45c.; 10,000 lbs. washed medium do. at 60c.; 50,000 lbs. Ohio do at 65c; 25,000 lbs. medium do. at 70c.; Wisconsin fleece at 55c.; fine medium do. at 59c.; black pulled at 49c; Western super pulled at 55c.; super do. at 58@58½c.; low rolls at 48@50c.; fine Texas at 36c., and fine unwashed at 32½c.

St. Louis.—Flour—Double extra at $5.30 bid; triple extra at $5 50 bid; family at $5 65 bid; choice at $5.87½. Wheat dull; No. 2 red fall at $1.22½@1.22¾; No. 3 do. at $1.20@1.20½; No. 4 do. at $1.13. Corn steady at 36½@36¾c. Oats quiet at 32⅝c. Rye dull at 73½c. bid. Pork dull; jobbing at $11.85@12. Lard quiet at 7c. Bacon—Shoulders at 4.65@4.75c.; clear ribs at 7.20c.; clear sides at 7.40@7.45c. Hogs strong and active; Yorkers and Baltimores at $4.15@4.35; packing at $4.10@4 30; butchers' to fancy at $4.45@4.60. Cattle in active

demand, and urgent for light to medium steers of 1,000 to 1,300 lbs. at $4@4.50; heavy steers slow and weak at $4.80@5.20; stockers and feeders scarce and wanted at $2.75@3.50 for the former, and $3.75@4.15 for the latter; butchers' stock in good demand. SHEEP—prices ranging from $4.25@6.25 for good to fancy.

Toledo.—WHEAT—No. 3 white Wabash at $1 27; No. 1 white Michigan, $1 27; amber Michigan, $1.31½; No. 2 red winter, spot at $1 32. CORN easier; No. 2 at 42½c.; No. 2 white at 45c.; rejected, 42½c. CLOVER seed firm; mammoth at $4 35; prime at $4 05; No. 2 at $3 80

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 13, 1880.

BEANS AND PEAS.—With the advanced season and quite liberal receipts the bean market is a shade in buyers' favor all through; in fact for wholesale business inside figures are all the market will bear. Green peas are only steady; the right of the demand is over; quoted at $1.80@1.82½ Wis. 0bls. Southern peas neglected; $2.25 represent only small lots; round parcel would not make $2. Marrow beans, prime, $1.65@1.67; fair to good, $1.60@1.67; medium, prime, $1.45@1.50; medium, fair to good, $1.35@1.40; pea, choice, $1.65@1.70; fair to good, $1.45@1.55; white kidney, choice, $1.75@1.80; fair to good, $1.60@1.70; red kidney, prime, $1.70; fair to good, $1.55@1.60, turtle soup, good to prime, $1.80@1.85.

Receipts of beans, 4,950; exports, 1,900 pckgs.
Receipts for week, 16,150 pkgs., exports, 6,000 do.

BEESWAX.—There is a small trade and a steady market at 24 to 25 for Western and Southern.

BROOM CORN.—Offerings are small and prices well maintained; quotations are for c oice brush at 9c.; choice hurl at 8c'; stalk braid at 6@7c.; mixed red and green at 5@6c.

BUTTER.—The crop of '79 is giving out fast, few lots of firkins or half tubs hold a place as table quality. Shippers have turned their attention to fair, useful State and have paid 22c. for lots that would soon be rejected if held for local use. New butter has a quick sale, and as before some special marks exceed the extreme in the competition to secure them. Mixed old and new will sell no better than common Western factory. Western dairy keeps on even grade of quality better than late supplies of old State and prices rule steady. The outlook of the market is strong, as neither State or Western supplies are likely to be plenty for a couple of weeks. New butter quoted: creamery, good to choice, 34@37c.; extra, 39c.; poor to fair, 27@30c.; fall creamery, 23@29c.; earlier made, 20@26c. New pails and tubs range 23@34c. State, pails and tub fall choice, 28@30c.; good to prime, 26@28c.; fair to good, 23@26c.; poor to fair, 20@23c.; pails and tubs, single dairy, fresh choice, 32@34c.; fresh, good to prime, 28@30c.; fresh, fair to good, 25@25c.; dairies, choice, 26@27c.; good to prime, 24@25c.; fair to good, 23@23c.; poor to fair, 19@22c.; bodies of dairies, 18@25c; very poor, 16@18c.; Western imitation creamery, 23@30c.; dairy, fresh, extra, 25@26c.; good to prime, 22@24c.; fair to good, 21@22c.; poor to fair, 14@17c.; special factory marks, extra, 25@26c.; prime, 21@22c.; fair to good 18@19c.; poor to fair, 17@19c.; very poor, 14@17c.; roll butter, prime, 19@23c.

CHEESE.—Shippers have been freer buyers this week, chiefly of parcels to be had at from 13½@14c.; the latter for fancy; there are selections, however, held at 14½@14¾c. The market is quite steady.

Quotations for State factory are: best at 14@14½c.; good to prime at 13½@14c.; fair to good at 13@13½c; do. poor at 12@12¾c. State farm dairy: good to prime at 13¾@14c.; fair to good at 13@13½c. Ohio factory: Cheddar, fine, 14c.; do., fair to good, 12½@13¼c.; flat, fine, 14@14¾; flat, good to prime, 13@13½c.; flat, fair to good, 12½@13c.

Receipts for week, 5,000 pkgs.; exports, 10,500 do.
Liverpool cable, 70s., a decline.
Steam to England 35s.

COTTON—The market has been fairly active, and firm, closing at, for March, 13.12@13.13c.; April, 13.18@13.19c.; May 13.29@12.30c.; June, 13.56@13.57c.; July, 13.67@13.68c.; August, 13.74@13.75c.; September, 13.35@13.36c.; October, 12.45@12.47c.; November 12.07@12.11c.; December, 12.04@12.04c.

DRIED FRUITS.—Apples are firm in price and have a steady fair demand. Peaches are quiet and prices unchanged. Blackberries are scarce and higher; other small fruits are unchanged; latest prices are for N. C. apples, fair to good, 7½@8¾c.; choice, at 9@9¾c.; fancy at 10@10¾c; Virginia, at 7@8c.; New York State quarters, at 7@8c.; sliced at 7½@8¾c.; patent evaporated, choice in cases, at 13¾@14c.; prime at 12½@13c. Evaporated peeled peaches, good to choice, at 22@26c.; unpeeled at 12@14c.; North Carolina peeled, fancy, at 20c.; choice old at 17@18c.; Georgia prime at 16@17c.; fair to good at 14@15c.; common at 10@12c.; unpeeled halves at 7½@8c.; do. quarters at 7@7½c. Pitted cherries at 15@16c. Blackberries at 14c. bid. Raspberries at 26@27c. Plums at 17@18c.

Exports for week, 150 bbls. dried apples.

EGGS.—Receipts for the week, 14,640 bbls.; do. last week 13,200 do. There have been several attempts to push up the market, but the best that was done was to make Western rule 13½c. for a day or two. The market is weak at the close at 13¼c. Supplies are liberal, as some owners have been holding for a higher market.

Near Points, ₱ doz., 11c.; State and Penn. 13@13½c. Western, fresh, 13@13¼c.; Southern, 12@13c.; Western and Canada, inferior, 11@12c.; limed are very dull at the late decline, quoted 8@10c.

FLOUR.—After a lull in trade and lower prices demand has quickened, chiefly on wants of exporters, and prices are hardening, especially for low grades.

Sales: prices are $4.40@5.25 or poor to fancy superfine State and Western; $5.25@5.45 for inferior to good extra do., odd lots and mixes: $5.45@5.75 for good to very choice do.; $5.20@5.45 for inferior to good shipping extra do., inferior to about choice white wheat extra $5.70@6.60; about choice to very fancy do. $6.60@7.25; red and amber winter wheat, inferior to very fancy trade and family, at $5.60@7.50; round hoop Ohio, $5.35@5 75; mid trade and family brands of do. at $5.80@7.00; the latter rate for fancy choice; St. Louis at $5.70@6.50 for inferior to very good extra; $6.50@7.75 for very good to fancy; Minnesota clear, inferior to fancy, at $5.60@6.80; Minnesota "straight," inferior to very fancy, at $6@7.75, and patent inferior to fancy at $6.75@8.75; unsound stock at from $3.25@5.75; city mill extra at $6.25@6.65 for ordinary to fancy for West Indies; do. for England, $5.20@5.60 for poor to choice; do. trade and family extras, $6.50@7.25; do. for South American, $6.50@7.00; No. 2 at $3.35@4.60 for poor to fancy.

CORN MEAL—Sales at $2.50@3.10 for yellow Western and $3.30 for Brandywine

FRESH FRUITS—Exports of apples for week, 3,750 bbls. Apples are quiet; buyers are very particular about quality when they pay the extremes. Late railroad lots arrive in poor order, none exceeding $2.75.

Baldwins, poor to best, $2@3.25; Greenings range at 2@$3; Russets, 2.50@$3. Cranberries firm; crates only offering, bbls. have to be made from N. J. stock when wanted. Crates, $2.75@3.25. Florida oranges are firm for pure; few first quality lots expected. Choice to fancy hf. bbl. case, $3 50@4.50; other, $2.50@3. Strawberries have arrived liberally; restaurants begin to make them a daily item on bills of fare; prices easy, 15@30c. ₱ qt. fair to choice. Peanuts steady at former figures. Va. hand-picked, 5¼@5¾c.; extra prime to fancy, 5¾@5¾c.; good to prime, 4¾@5c.; shelled, 5½@6c. Hickory nuts, 75@90c. Pecans, 9½c.

FURS AND SKINS.—The market is very quiet here since the disappointing news from late London sale. It is likely that an easier state of rate will soon be named. Poorly cured lots not wanted now at any price, as all purchases will have to be held either here or abroad.

GRAIN.—Wheat has been unusually active this week, and prices showing frequent fluctuations, closing, however, strong. Exporters have taken larger quantities, but they do not show altogether in the reports for this week, which are in the neighborhood of 800,000 bush; speculation has been rampant and one day's business this week reached about 3,000,000 bush.; latest prices are of No. 1 white at $1.40@1.45; do., March, at $1.44@1.44½; do., April, at $1.43½@1.44¾; do., May, at $1.41¾@1.42; ungraded white at $1 42c.; No. 2 red at $1.43½@1.49; do., March, at $1.48@1.48¾; do. April option, at $1.48¼ at 1.47¾; do., May, at $1.44½@1.45; No. 3 red (Kansas grade) at $1.40 ungraded red at 1.41@$1.46; No. 2 Chicago at $1,41; No. 2 Northwest April at $1.41; do., May at $1,36; New York No. 3 spring at $1.34. Rye sold in a small way at 92c. for State; larger parcels are held higher

Corn has been very active for prompt delivery at higher prices, but closed weak. Shipments this week have been 480,000 bush.; latest prices are for New York No. 2 at 61@61¼c.; do., March, at 57¾@58c.; do., April, at 51¾@54¼c.; do., May, at 53c.; New York steamer mixed at 60¾@61c.; do., March, at 57c.; do., April, at 54c.; ungraded mixed Western at 59¾@61¾c.; New York No. 3 at 53½@59¾c.; yellow, Jersey at 61 c.; steamer yellow at 61c.; yellow western at 61c.; No. 2, white at 64c.; steamer white at 61c.; round yellow at 60@60¼c. Oats closed easy on full offerings; latest sales are of No. 1 white at 51c.; No. 2 white at 1¾7c.; No. 3 white at 47c.; New York No. 1 at 48c.; New York No. 2 at 47¾@48c.; do., March option, 47c; do., April option at 44¾@45c.; New York No. 3 at 47c.; ungraded white western at 48@50c.; ungraded mixed western at 47@48c.; white State at 49@50¾c.; mixed State at 47¾@48c.; No. 2 Chicago at 43c.

HAY AND STRAW.—The receipts are very moderate, demand fair and prices steady. Shipping hay quoted at 70@75c.; retail lots at 80@85c. for medium, and 90@95c. for prime; clover at 60@65c. Straw at 95c.@1.05 for long rye; 65@70c. for short rye, and 55@60c. for oat.

Exports for the week, 2,250 bales.

HONEY—Dull at 14@15c. Single comb, w. clover 11@13c.; larger pkgs., 10@11c. Buckwheat, comb and extracted clover, 8@9c., strained.

HOPS.—There have been a few small sales here but no vig rin any quarter, and prices are nominally unchanged. Quotations are for

	Cents per ℔.

STOCKBRIDGE MANURES
For 1880.

Some years ago the Stockbridge Manures were only known to a few farmers in the Connecticut Valley. Now they are so extensively used in different parts of the country as to require two large factories, one in New York and one in Boston to manufacture them. This increase shows what farmers think of good fertilizers, and is not only due to the fact that they are reliable, well-made, and high-grade manures, but also to the fact that farmers have

FOUND THEM PROFITABLE TO USE.

Now that corn, and other farm produce is bringing such good prices, we anticipate that farmers will invest still more largely in our fertilizers.

Besides the Stockbridge Manures, we manufacture several high-grade Phosphates, and deal in first-class chemicals of all kinds. Farmers who intend to use Fertilizers of any kind, should

A GOOD PIANO.
Frank Leslie's Illustrated Newspaper says:
A good piano at a fair price is one of the wants of the times. An instrument that is durable, that is substantially made, and has all those qualities of tone which make a first-class piano, can be had from the MENDELSSOHN PIANO CO., New York, from $150 to $400. For over thirty-eight years their factory has been producing pianos, and adopting every new invention which has proved itself to be valuable. They can be compared by an expert with the instruments of the highest name and fancy price, and the result is surprisingly satisfactory. The piano is warranted for five years, and no purchaser has ever made a complaint. From personal knowledge and critical examination we can recommend any one to send for a catalogue to the above-mentioned manufacturers. (We have seen many letters from purchasers of the above pianos and feel satisfied that any one sending for one of the instruments will be dealt fairly by, and satisfaction obtained.—EDS.)

CLUB NOTES.

THE season for active work is near at hand. The members of the Horticultural Club must now "be up and doing." Those who have not already purchased seeds of the plants they wish to grow this summer should do so without delay And right here, let me tell my dear young relatives that this is an excellent way of spending their spare money. A noted nurseryman, whose articles may often be seen in the RURAL, once told me that while a boy he always saved up his pocket money to buy seeds and plants with it. When his brothers and sisters bought sweetmeats for their money he carefully put his in the saving bank till he was able to buy what he wanted. Then came the selection of the seeds. He searched the seedsmen's catalogues, read all he could find that would enlighten him about his pets, and was thus prepared to make a wise selection. During the summer he was able to show brilliant flowers and well-grown vegetables as the proceeds of his spare money, while his companions had only the remembrance of stomach aches, the results of sweetmeats they had purchased. As a guide in the selection and treatment of your seeds, read carefully the articles on floriculture that appeared in these columns on December 13th, Jan. 31st and March 13th; they were written expressly for you. The flowers there recommended are likely to give you most satisfaction. I will here add a few more that are very desirable. Mignonette (Reseda odorata) is a little plant that should be found in every garden. It is valued for its sweet, agreeable scent. Sow the seed in the open ground where the plants are to remain. Keep them well supplied with water.

Nasturtium, (Tropeolum) of which choose some strong growing variety, it will give better satisfaction than the dwarfs. The flowers are very bright and showy. The seeds are as large as peas and should be planted about an inch deep. Morning Glory, (Convolvulus) is a grand old flower that should not be neglected because it is common. It grows like a weed and the flowers are very beautiful. These, with the kinds named in the floricultural articles make quite a long list. Of course, I don't mean that you should buy all of these, but select a few of those you like best. Nor should you forget to procure seeds of a few choice vegetables. Meantime I am making arrangements for a seed distribution among the members of the Horticultural Club. The members are now so numerous that this is quite a formidable affair, and in the future I shall be obliged to limit the seed distribution to those members who by their interest in horticulture prove themselves worthy to such distinction. At present, I would very much like to know who of the members are trying to graft fruit trees this spring, as recommended in the article on that subject in the RURAL of Feb. 14th. Experience is the best teacher. The only way to learn to graft is to try it. Who can report progress?

UNCLE MARK.

REMINISCENCES OF A LITTLE GIRL.

MRS. M. J. GALPIN.

CHAPTER IV.

ON the morning after their marriage Father Tom and his bride took counsel together what had best be done. He was for going back and braving it out, but the thought filled her with such terror that it was soon abandoned. Mrs. Silk had a married sister living in Athlone, and if they could only make their way there without being discovered they hoped to elude their persecutors. Father Tom thought that perhaps people there would not know his connection with and desertion of the priesthood, and he could then turn his education to some account. But he reckoned without his host, as you will see a little further on. Don't you think they were a delightful couple (of fools, I was going to say)? They had no money and no clothes except what they wore on their flight, and what to do under the circumstances was the all-important question. The old priest who married them was a kind of hermit, so that he possessed almost nothing. O! how were they to begin life under such auspices? Already the clouds seemed lowering above their horizon ere they had fairly launched on life's troubled sea. I earnestly hope, dear children, that the fortunes of this rash pair will be a warning to you never to rush into contracts of any kind except by the advice of your parents and after due deliberation. The priest told them of a little village about ten miles away where they might find a chance to do something towards earning a living.

With light and hopeful hearts they set out on their tramp, as the expense of hiring a "jaunting car" was not to be thought of. Starting at sunrise a few days after their marriage they proceeded on their way; the skylark warbled forth his morning praise, and anon the blackbird and thrush added to the glorious concert, till all nature seemed to rejoice and welcome this hapless pair as they wended their way along the grassy road, or rested now and then beside the fragrant hawthorne hedges. They would slake their thirst by some babbling brook, or refresh themselves with the sparkling waters of some cooling spring. Ireland is famous for its springs, both "holy" and otherwise, while all its streams flow in limpid clearness on pebbly beds, and rise and fall over stones, making infinite cataracts. The scenery in Ireland is unsurpassed in grandeur and beauty, but to appreciate its loveliness one must see the change from mountain to valley, from the roaring torrent to the singing brook, as these wanderers did. About sundown they reached the little village of Glenmore, and Father Tom took a letter of introduction the old priest had given him to the cure of the village. Father Silk learned that there was a schoolmaster wanted, and he was promised the position if he suited. The good old cure pitied him, but he never dreamed he was a banished priest; if he had he would have spurned him like a dog. Father Tom's wife could make beautiful lace and all kinds of embroidery, and so they hoped between them to at least keep the "wolf" of hunger from their door.

Father Silk obtained the school, while his wife assisted him, and after school hours worked at her lace making. Matters glided on smoothly for some months, but at last her people learned where she was, and they then wrote her the terrible tidings of the death of two of her little ones, and wanted to know what they should do with little Katie, who had by this time fully recovered. The shock produced by the news of the death of her children, prostrated her on a bed of sickness. She knew naught for days, but a strong constitution prevailed over the delirium, and she awoke at last from her night of oblivion. The memory of her sorrow rushed over her like a tidal wave, threatening to again obscure the reason but so lately regained; but the common sense of the nurse came to the rescue, and though homely in its expression it served its purpose. "Howly Mother," cried Mrs. Doolan, "will ye be crying the purty eyes out of yer head afther the blessed angels that's gone to liven? Shame on ye; and look at that "gossoon" (meaning Father Tom) it's just crazy the poor boy is intirely; faith, it's himself that don't know which end he's standing on" Father Tom felt wretched, but worse was to come. Ere long their friend, the village priest, received a letter from L——, their native town, giving him a full account of their flight and their sin against the church, and before nightfall the rabble were possessed of all the particulars A mob gathered round the house, threatening them with dire punishment for their "heresy." The nurse, Mrs. Doolan, lent her large cloak to Mrs. Silk, which effectually concealed her form, and she escaped by the back door into the garden, where she crouched beneath the hedge, waiting to see what would become of her husband. He, meanwhile, by the advice of Mrs. Doolan, ascended to the loft, and sprang out upon a low-thatched roof beneath, and thence to the ground; thus saving himself from the fury of the half drunken crowd. I suppose my little readers will wonder why there was such a fuss made over a man's changing his religious views; but you must know that the Irish Catholic will fight for the honor of his "church" quicker than he will for home or fireside.

The hunted pair hid for some days in an old abandoned hut that had been built near a bog by the turf cutters, and here their only friend, Mrs. Doolan, brought them something to eat under cover of the night. She also saved what few of their things she could get, before the infuriated mob had burned down the cottage they had occupied. The idea of living in the old hut could not be thought of, so one dismal night under cover of the friendly darkness, they took their departure along the lonely road, determined to stop no more at villages, but to reach Athlone if possible, where they could find relations and claim the protection of the law if necessary.

After many days, footsore and weary, they reached the suburbs of the city, and here they tarried a while to recruit their failing strength and make themselves presentable. Helping his wife down the rock, Father Tom found a secluded grotto beside a running stream, and here unmolested their they made toilet, taking clothes from the pack which he had carried on his shoulders from the hut. They now pursued their way along the route with renewed hope and vigor. Towards sunset next day they entered the city and found the residence of Mrs. Silk's sister, who, although surprised, welcomed them with open arms. The whole truth and situation of affairs was told Aunt Margaret, and she wept as she listened to the hardships endured by this ill-fated pair. Her advice upon learning the true state of affairs, was that Father Tom should try and obtain some work, while her sister could remain with her for the present. Owing to Father Tom's education he was capable of filling a good many positions, and hearing of the general survey that was then being made of Ireland (between the years 1839 and 1843, if I remember aright, the date as told me in after years by himself), he determined to try and find employment with them if possible. He succeeded in obtaining the position as chain bearer to the surveyors. He remained on this ordinance survey until its completion and rose from "chain bearer" to be the foremost among the surveyors and engineers, and the best draughtsman and penman in the office. Penmanship was an inborn talent with him; I have never seen any writing that equaled his except the copies of Prof Gaskell's Compendium. In my next chapter we will follow his fortunes whilst he was engaged on this survey. As many and interesting were the sights and scenes he witnessed while traversing the country on his route.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I thought I would sit down this evening and write an account of my success in gardening last summer. I fear it will be a long one, but I must beg your patience, and I will make it as short as I can. The tomatoes and the Oxheart Peppers were planted in a box together; they all came up, I guess, but they were so late the peppers did not come to anything, and the tomatoes did not ripen, for which I was sorry as you asked me to report as to their quality. The gourd seeds, the Turnip radish, and the three kinds of celery, got mislaid till it was too late to do anything with them, but I shall plant them this summer.

Of the six seeds of Smith's Prize Balsams, three came up; after they were set out one died, the other two grew and blossomed. One was pink and the other white, the white was the handsomest and the more double. I got no seeds. The Black Pansies came up and did beautifully; they were very handsome and blossomed all summer long. With those and the ones I had before, I had sixteen different kinds of Pansies. I gathered quite a lot of seeds. The Phlox Drummondii made a splendid bed, and were greatly admired.

I had lots of Petunias and they were very pretty. The cut-leaved Pinks were very odd, but pretty, and they did nicely as also did the Diadem Pinks. I did not get a single plant from the two kinds of Aquilegias you sent, which I don't understand, as I am sure they were planted right. I am sorry, for I think they are pretty, and we haven't any now, though we used to have them. I have two nice Hollyhocks. The Hibiscus Syriacus came up well; but there was some kind of foliage plant that did not come up at all. I raised quite a bed of Gladiolus; they grew from two to three-and-a-half feet high, and nearly all sent up three flower stalks; but I guess you are weary; so good-bye.

Your niece, MABEL C. HOSKINS.

Orleans Co., Vt.

DEAR UNCLE MARK:—Will you allow me space enough to ask some of the cousins to correspond privately with me? I correspond with one of the cousins, and I will be glad if some of them will write to me soon. Yours truly, LILLY BLAIR.

Griffin, Ga., P. O. Box 123.

BRIEFLETS.

Now, wouldn't it be a good idea to have the Hon.-Benjamin Le Fevre, investigated? . . Whether the Maine beet-sugar factory pays or not will be known when—and not before—the State aid is withdrawn. Should the business continue after that, it will be because there's money it. . . Professors Collier and Goessman don't exactly agree as to the probable profits of making sugar from Early Amber cane in the Eastern States. When *Professors* disagree, let the *farmers* decide. . . We warn our readers against the THWACK Raspberry. Two years ago we reported the fruit as large, and bright in color, firm and worthless—except for market. We have not since had occasion to change our opinion. . . The Indiana Farmer says he is lucky who buys his supply of maple sirup before it is doctored with glucose or sorghum molasses. . . One good reason why persons should prefer to live in the city than in the country is that fewer are struck by lightning in the former. . . Some one has written on "What Girls Think." This is very complimentary to that class of girls who, to be judged by their talk, never think at all.—New Haven Register. . . Lord Bacon said "speaking makes a ready man, and reading a full man. Modern people have an idea that something besides reading makes some men full.—Syracuse Times. . . A well-spent life is like a well-spent day; at its close there is a wish for rest. . . Professor Corbett offers to tell the French Minister of Agriculture how French poultry keepers may gain many millions of francs every year. He charges the moderate sum of $200,000 for his invention! The French Minister has not yet sent the money. . . Speaking of political journalism, Eugene Howland says: "That Democrats own organs of Republican opinion, and Republicans own organs of Democratic opinion, while the writers upon both of them are conscious of the unreliability of both for the expression of their own convictions as men and citizens, is a sad outlook for the moral future of the State." . . Crocuses were in bloom at the Rural Grounds Feb 22. . . The Editor of the RURAL NEW-YORKER has gone South—Aiken, S. C.—for his health, to remain until May 1st. Personal letters may be addressed to him there. . . Whether the growing of sugar beets in Maine will or will not pay is not yet fully determined. But last year's experience gives little encouragement. . . There are still a few who have a good word to speak for Prickly Comfrey. . . We are told that "an honest man is the noblest work of God;" but the demand for the work has been so limited that it has been suggested that a large share of the "fust edishun" must be still in the author's hands. . . Can anything be more frightful and ghastly, asks Truth, than an elaborate costume on a wintry day? . . They are talking in England of "a severe epidemic of matrimony." . . The mining "boom" is the golden opportunity of the original owners of mines, the middlemen and the brokers; but they stand from under when the evil days come. . . Thackeray asserts that a "fine furious temper" is an invaluable possession to him, or her, its possessor, more especially if accompanied with a certain bravery, which oftentimes goes along with it; inasmuch, as half the world being lazy and the rest timid, the fine furious temper is pretty sure of getting its own way. . . It is said that Queen Victoria must save not less than $1,000,000 per year. In connection with her hungry Irish subjects, the aphorism that "benevolence begins at home" naturally suggests itself. . . All that Finlay Dunn and Clare S. Read have said in England relative to the agriculture of this country, gives small comfort to the English farmer. . . In 1841 the population of Ireland was 8,175,124. In 1871 it was 5,511,416. The Public Ledger denounces the suffering in Ireland as Great Britain's Burning shame. . . A gentleman of Kentucky has for ten years painted his pear trees with linseed oil, to prevent blight, with signal success. . . Many substitutes are talked about for the potato—among them the Camass. But what's the matter with the potato that we should need a substitute?. . .

Sawing off a Log, Easy and Fast.

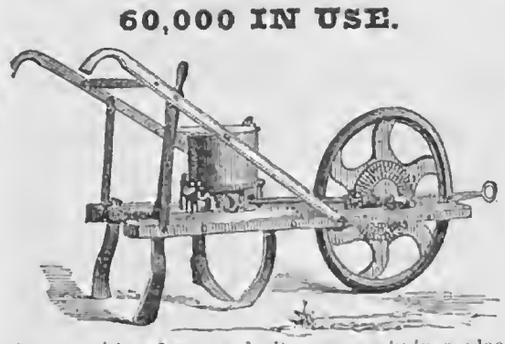
Our latest improved sawing machine cuts off a 2-foot log in 2 minutes. A **$100 PRESENT** will be given to two men who can saw as much in the old way, as one man can with this machine. Circulars sent free. W. GILES, 741 W. Lake St., Chicago, Ill.

A. H. Frank, Buffalo, N. Y., owns and controls Eastern and Middle States.

CAUTION.—Any sawing machine having a seat for the operator, or treadles for his feet, is an infringement on our patents, and we are prosecuting all infringers. SO BEWARE WHO YOU BUY OF.

HOOSIER CORN DRILL!

60,000 IN USE.



Drops, with great regularity, one grain in a place, either 12, 16 or 20 inches apart, does the covering uniform in depth, and is both time and labor saving. A given area of corn planted with this machine contains as many plants as when hilled, but their arrangement is such that *each* plant has access to the *same* amount of plant-food that must necessarily be *divided* between from 3 to 5 plants when huddled together in a *hill*. Hence a healthy start and vigorous growth of the plants and the consequent production of **large, well matured** ears, by which the quality is improved, and the yield increased from 10 to 20 bushels per acre, over hill planting are natural results following the use of our **Corn Drill.** Send for circular.

New Cook Book

PLAIN and FANCY COOKING. A book of 120 pages and over 400 carefully tried receipts by a practical housekeeper. It teaches how to prepare nice dishes at a moderate cost, and contains all that any housekeeper can desire. Also contains a carefully-prepared chapter on Cooking for Invalids. Price, post-paid, only 25 Cents. Agents wanted. Price per dozen or hundred given, on application. Address J. L. PATTEN & CO., 7 Barclay St., New York.

KIDNEY-WORT

PERMANENTLY CURES KIDNEY DISEASES, LIVER COMPLAINTS, Constipation and Piles.

Dr. R. H. Clark, South Hero, Vt., says, "In cases of Kidney Troubles it has acted like a charm. It has cured many very bad cases of Piles, and has never failed to act efficiently."

Nelson Fairchild, of St. Albans, Vt., says, "It is of priceless value. After sixteen years of great suffering from Piles and Costiveness it completely cured me."

C. S. Hogabon, of Berkshire, says, "One package has done wonders for me in completely curing a severe Liver and Kidney Complaint."

IT HAS WONDERFUL POWER. WHY?

Because it Acts on the LIVER, the BOWELS and the KIDNEYS at the same time.

Because it cleanses the system of the poisonous humors that develope in Kidney and Urinary diseases, Biliousness, Jaundice, Constipation, Piles, or in Rheumatism, Neuralgia and nervous disorders.

KIDNEY-WORT is a dry vegetable compound and can be sent by mail prepaid.

One package will make six qts of medicine.

TRY IT NOW!

☞ Buy it at the Druggists. Price, $1.00.

Humorous.

Miss Nellie Estelle, *nee* Ellen Kelly, and Miss Effie Celeste, *nee* Mary Crump, are two ballet-girls in New York. They fell out about a dog, and had recourse to a police magistrate in order to settle their difference. During the proceedings the following correspondence was read:

Mary Crump—Your dogg is treating my cat shameful. If he ain't made to stop I will make him myself. Miss Nellie Estelle.

Ellen Kelly—Your impertinent letter don't deserve an answer from any lady. But I give you warn that you will lay your filthy hands on my dog (see dictionery) if you dare. I don't demean myself by putting my name to this.

Mary Crump—If my hans is filthey I use soape and water on my nek, and not powder I am not ashamed of my name, if you are.

Miss Ellen Kelly, *nee* Celeste.

On the case being reported, the reporter received the following letter from one of the irate ladies:

Mr. Reporter—Falsehood and desete is foreign to me. I despise the actions of a false friend. Let herr doo and say her worse, meaning no disrespect to your papper, I scorn to say anything except that I will yet be even with one so low as to forget the freuds of her adversite. Yours more respectfully,

Miss Estelle.

P. S.—Excuse bad ritin as my nerves is alpon edge. Miss Nellie Estelle.

Many a poor but religious editor has been compelled to receive payment for his valuable paper in turnips, string beans, pumpkins and such like articles of diet, but we never remember to have heard of a butcher who would accept of a column of paragraphs in return for a porterhouse steak or a small roast for Sunday.—Piscataway Presbyterian.

A 3-year-old little girl was taught to close her evening prayer, during the temporary absence of her father, with, "And please watch over my papa." It sounded very sweet, but the mother's amazement may be imagined when the child said, "And you'd better keep an eye on mamma, too."

"Going to leave, Mary?" "Yes, mum; I find I am very discontented." "If there is anything I can do to make you comfortable let me know." "No, mum, it's impossible. You can't alter your figger to my figger, no mor'n I can. Your dresses won't fit me, and I can't appear on Sundays as I used at my last place, where missus' clothes fitted 'xactly."

When Plagued by the Vagaries.

Of a disordered liver, the bilious need expect to derive no permanent relief from the use of calomel, blue pill, or the barbarous cathartics now happily losing ground in general and professional estimation. These rasp, convulse and weaken the system, but Hostetter's Stomach Bitters relieve, regulate and invigorate it. Those significant pains in the liver, the saffron hue which its derangement communicates to the skin, the impurity of the blood, constipation, furred condition of the tongue and contamination of the breath which result from biliousness, are entirely, speedily and pleasantly removed by this beneficent alterative, which is likewise a potent remedy for chills and fever, and its best preventive. While the system is regulated and purified, it is also thoroughly invigorated by this superlatively fine medicine, which is of botanic origin, and contains none but salutary ingredients. The medical fraternity highly commend it.

AGRICULTURAL IMPROVEMENTS.

Land-Steward (to Tenant-Farmer).—"Well, Giles, what are you going to sow in here?"

Farmer.—"Ain't 'zactly made up my mind, sir: but if we could put in a few Stewards and Land-Agents—they seems to thrive best on the land nowadays!"

C. GILBERT'S STARCHES ARE ABSOLUTELY PURE.

Send for pamphlet, containing reports of wonderful results from the use of THE MAPES MANURES.

The Mapes Potato Manure. Price per ton, $48. Per Bag (200 lbs.), $4.80. Use three bags per acre—in drills of hills.

For some practical results see "Rural New Yorker" last week, page 177; also for March 6th, page 153.

The Mapes Grass and Grain Spring Top-Dressing.

Price Per Ton, $51. Per Bag (200 lbs.), $5.10. Spread broadcast on Grass or Grain—two bags per acre in spring—earlier the better.

Wheat and Permanent Grass—The Mapes Wheat Manure Compared with Stable Manure.—Years 1877'--78--'79.

VALENTINE FROST, LOCUST VALLEY, L. I., Feb., 1880, reports:—

"In fall 1877, seeded down with wheat and applied broadcast, 1,000 lbs. per acre of the Mapes Wheat Manure. The land was excellent wheat and grass land when *well manured*. The yield of wheat was heavy and of fine quality; in 1879 the first mowing of grass cut heavy; crop was "down" two weeks before cutting. Where I used stable manure the yield was not, in any case, any better than from the Mapes Manure and *the cost was more than double*. The season was tolerably favorable.

I had two lots; one of eight acres and one of six acres; on the six acre lot I put 300 loads of New York Stable Manure on half of it (3 acres); and on the eight acre lot put 400 loads of New York Stable Manure on four acres, a half of it. On the remaining portions, half of each lot, I put 1,000 lbs. of the Mapes Wheat Manure per acre. Both yielded excellently of wheat. The grass was *extraordinary fine, the advantage being if anything in favor of the Mapes Manure through all the years*. The point is, that the Mapes Manure costing $25 *per acre, was fully equal if not better than the New York Manure*, the latter costing $55 to $60 per acre, independent of *great saving in cost of application*."

"Have used the Mapes Manures *four years* with good results, and use them in increased quantities each year."

The Mapes Complete Manure (for light soils). Price per Ton, $51. Per Bag, $5.10.

This is our Manure for Onions, Cabbages, and all Garden truck on *all* soils, and for Grass and Grain Crops, seeding down on light soils.

The Mapes Corn Manure. Price per Ton, $49. Per Bag, $4.90.

Extract from New York Times, weekly edition, Sept. 3d, 1879.

HUNGARIAN GRASS.

This is one of the most valuable fodder crops, but to attempt to grow it upon any but rich soil is a waste of time and labor. It seems, however, to respond to artificial manures very satisfactorily. A crop grown the present season upon land fertilized with 600 lbs. per acre of the Mapes Complete Manure, without any other fertilizer, shows the effect of the manure in an extraordinary manner, and this is the THIRD CROP since the manuring. The first was corn, which yielded 489 BUSHELS OF EARS ON THE ACRE; the next was rye, cut for fodder, and a heavy crop; the present is Hungarian, now cut for fodder, and shows in places a luxuriant growth where the fertilizer happened to be spread somewhat irregularly. The whole, however, is a good crop. The persistence of artificial fertilizers may therefore be calculated for AT LEAST THREE YEARS.

NO CARTAGE. SINGLE BAGS SOLD AT TON RATES.

These Manures are all READY-MIXED, in FINE, DRY condition, and EASY OF APPLICATION.—Full Directions for use and all information required for their use accompany EVERY PACKAGE. Send for New Pamphlet (1880). Address

NEW POTATO, "ST. PATRICK."

In appearance the St. Patrick is undoubtedly one of the handsomest Potatoes ever grown; it has a smooth white skin, and white flesh, few and shallow eyes; in shape it is rather oblong than round, and has no core or hollow; it is also a strong and hardy grower, and, from all accounts, has withstood the rot so prevalent last season better than any other sort. It produces but few small tubers, ripens medium early, and, finally, it is enormously productive and of fine quality.

At the Fall Exhibition of the New York Horticultural Society, held in this city, September, 1879, the St. Patrick shown by us was awarded the First Premium over all other Seedling Potatoes exhibited.

Price 50 cts. per lb., by Mail.

Or by Express or Freight, $2.50 per peck; $8.00 per bushel; $30.00 per bbl.

We also offer selected stocks of the following leading Seeds:

		¼ lb.	1 lb.
Beet.	—Early Blood Turnip	$0.10	$0.35

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Vol. XXXIX. No. 13. Whole No. 1574. | NEW YORK, MARCH 27, 1880. | Price Five Cents. $2.00 Per Year.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

The Swine-Herd.

SWINE.

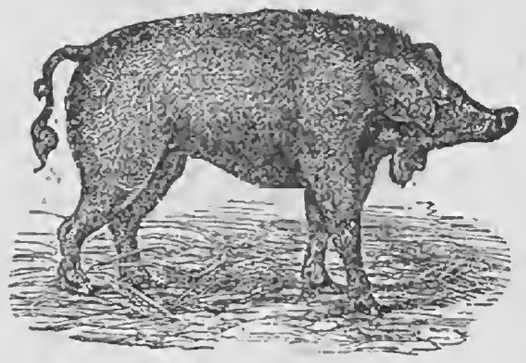
The Importance of Possessing the Best Breeds.

A. B. ALLEN.

Swine have increased so rapidly in the United States and its Territories during the past 10 years, that an indefinite guess only can be given as to the number which the census of next June will show us on its completion. A recent report which I have seen of the hogs packed at the West, in the season of 1878, puts the figures at 5,850,000, while those of 1879 are represented as something less.

The Hon. J. R. Dodge, in a late article in the N. Y. Weekly Tribune, estimates the live and dead swine exported in 1879 at 6,000 000 head; and the annual product of our country at the enormous weight of 5,000 000,000 pounds. How nearly exact this may be I cannot say; but in any event, if a perfectly correct weight could be had at this moment, there is no doubt we should be astounded at the additional figures it would show over those of the year 1870.

Suppose the live weight of swine, as stated above was of the best breed, as the Berkshire, it would be a low figure to set down its average at four cents per pound. In this case, it would amount to $200 000,000. If of a medium breed, an average of three cents per pound would probably be as much as could be real-



IRISH GREYHOUND PIG.—FIG. 93.

ized, thus making the value $150,000,000. If of an inferior breed, two cents per pound are all it would be worth, reducing the value to $100,000,000. If, like the Irish Greyhound Pig, fig. 93, small account could be made of it; for by no system of feeding can such an animal be made good pork; and it would only be a waste of provisions to dole them out to it. The United States during the last fiscal year exported $79,438,936 worth of these products: $51,074,433 being in hams; $22,856,673 in lard; $4 807,568 in pork and $700,262 in live hogs.

The Berkshire.

Of all our breeds of swine, I do not hesitate to place the Berkshire in the very front rank for general purposes, as a cross from him on any other always results in an improvement, while he is sure to be deteriorated if any other breed is crossed upon him. Then for the particular purpose of obtaining extra choice hams and shoulders for smoking, and side pieces for bacon, of a tender, lean, juicy quality, no other breed of swine within my knowledge can be compared to him.

So highly esteemed had the Berkshire become in our country, and so great the wealth and prosperity, especially in the wide pork regions of the West, that was certain to follow from keeping up his peculiar good qualities and perpetuating them in purity, that on February 25th, 1875, an association of enterprising and enlightened breeders was formed at Springfield, Illinois, to more fully insure this desideratum. It took the name of the American Berkshire Association, was incorporated March, 18th 1879, and fixed its headquarters at Springfield, Illinois, electing a President and other necessary officers. The Hon. Phil. M. Springer was made Secretary, who still continues in the office and is also the chief manager of affairs.

The Association proceeded to get up a Herd Book for the record of pedigrees, the first volume of which was published in May 1876. This has been succeeded by volumes, II, III, and IV., and with these are incorporated in their introductions, valuable prize essays of the history of Berkshires, the best method of breeding and rearing, as also that of the prevention of disease and of treating it whenever happening to occur.

BERKSHIRE SOW.—FIG. 94.

The Poland-China.

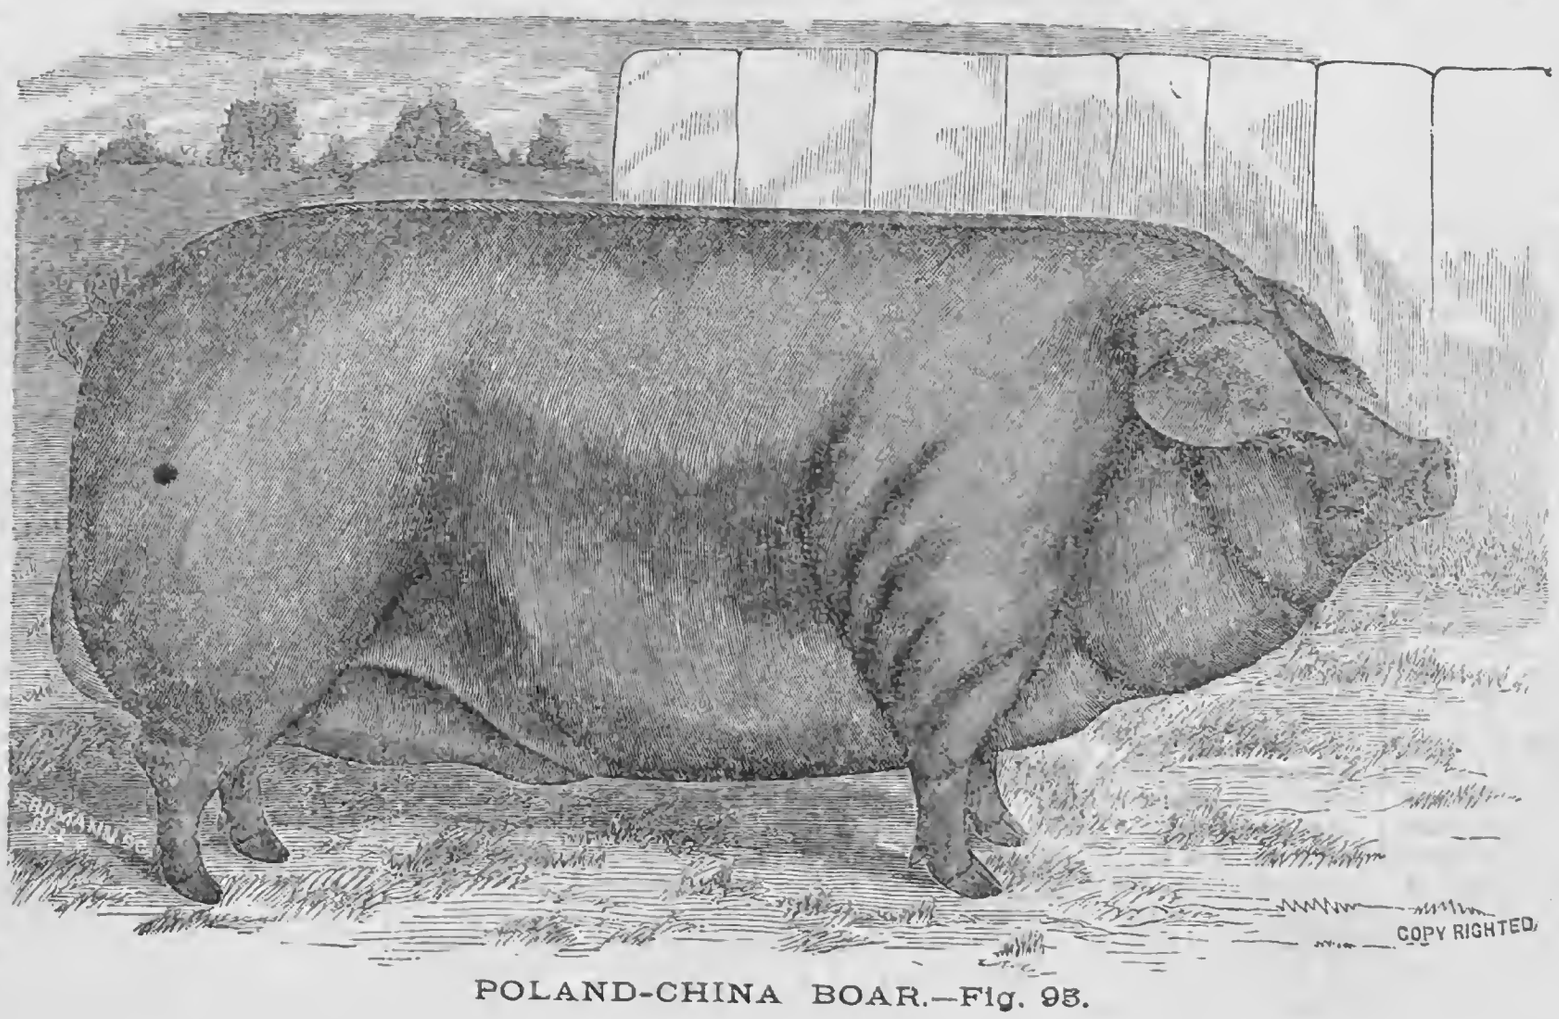
This is the most popular breed of swine at present among us for the production of fat pork suitable for salting for general family use, sea-stores and shipping abroad. They are usually larger than the Berkshire, spotted with rather more black than white; mature almost as soon, and are equally hardy, vigorous and thrifty. As this now distinguished breed is of American origin and completeness, we may well be proud of it, and give it the preference wherever suitable to the requirements of our farmers.

The first volume of a Herd Book of these has just been published in Ohio, under the name of the Poland-China Record. In this the history of the breed is given, the foundation of which, it is asserted, was begun in the Miami Valley in the year 1816, with three breeds of swine, then known there as the Russia, the Byfield and the Big China. Males of these were crossed more or less upon the native females of the Valley, and from time to time this produce was crossed with other breeds, the main improver, after the year 1838, being, as I have been informed, the Berkshire.

I well recollect when first visiting the Miami Valley in December 1841, seeing there a considerable number of very large white swine, closely resembling the English Yorkshire of that day. These were called the Miami breed. Females had been crossed to some extent with Berkshire boars, and most of this produce which was pointed out to me, had grown up large, splendid animals, quite Berkshire-like in form and points, and spotted black and white nearly equally. At the same time I saw an Irish grazier or two there, which I was told had been crossed on the Miamis. This was a white breed, of the size of the larger class of the Berkshires with prick-up ears, and about as fine in the points, but not so fully developed in the hams. I have been informed that they originated from Yorkshire swine, taken to Ireland many years before.

For years past various accounts have appeared in the Western agricultural papers of the origin and subsequent breeding of the Poland-Chinas, till they have become the excellent fixed breed we now find them. I trust their history is fully established as published in their Record, and that all disputes as to it may end. It is sufficient to say, hereafter, that they are well worthy of being perpetuated as we now find them, and that the various breeders in the Western States, who have united in bringing them to their present state of perfection, may well be satisfied with the great good to the public which they have accomplished.

BERKSHIRE BOAR.—FIG 96.



POLAND-CHINA BOAR.—Fig. 95.

The Herdsman.

STOCK NOTES FROM IOWA.

It is the opinion of our oldest settlers that never before within their recollection has January shed so many tears as she did in 1880. The weather, up to the present time, has been very mild, with prevailing cloudy and foggy days. Even the noted London fog can scarcely equal the watery vapor that settles down upon us to remain three or four days at a time. Occasionally we get a day of bright sunshine and of exceptional beauty.

Our markets are good. Just now pork stands at 4 cents, but the usual figures are $4 25 and $4.50 per cwt. We have one of the best markets for butter in the West—Manchester. That staple article is worth, fresh from the churn, 25c@30c. per pound; corn sells for 30c. per bushel; oats, 35c.; fat cattle are handled by several firms hereabouts and are eagerly sought after at $4 per cwt., live weight.

Having made up my mind to slop my cows the coming season, the first necessary thing to do was to count the cost. I therefore made out a bill for lumber for troughs, which amounted to a trifle over four dollars, when an idea occurred to me which saved me considerable money besides a vast amount of inconvenience. I went to my grocer and procured for eighty cents salt and sugar barrels enough to answer my purpose. I then sawed off the barrels at the third hoop and nailed a piece of board at the bottoms, and now have as good and substantial slop buckets as I desire. I feed shorts and find that it pays me, and am more convinced now than ever before that the better farmers keep their cows, the more profit is realized from them, consequently the better it is for them. If those farmers who are always "going to try the experiment" of giving their cows bran or shorts, to see if it pays, will "stand not upon the order of going but go at once," I am certain that the end will justify the means. Never mind the trouble! There is nothing in our line of business that will pay us so well for our

time and trouble as the best of care and attention to our dairy cows—or indeed any stock.

Shades of Solomon, what wisdom! I read in a paper not long since that "farmers should not let their sows have large litters of pigs. Five are enough, unless they have plenty of milk. This precious bit of knowledge doubtless had its birth in the capacious brain of some city wiseacre who "runs" the agricultural column of a secular or Christian weekly, and who, without doubt, has not practical knowledge enough to engineer the construction of a fourth-rate chicken coop. I had a sow farrow yesterday, dropping seven nice, fat pigs, and I have not plenty of milk either, but I trust that the sow will afford an abundance if I keep her as I should. We say on Willow Grove farm, let your sows *have* all the pigs they can; then use judgment in feeding for a few days, giving only coarse, sloppy food, poor and bulky, gradually increasing to a richer diet. After two weeks, give her all she will eat of the richest milk-producing food you can provide and you will "thank your stars" that you did not bid her stop after she had given you five! Now let the reader "point the moral," and provide himself with a good agricultural paper such as the RURAL NEW-YORKER, if he would be thoroughly posted, and not depend upon the ordinary weekly newspaper with its column of extraordinary theories and suggestions. C. S. B.

OUR ANIMAL PORTRAITS.—We give this week likenesses of two of the most fashionably-bred specimens of one of the best known Short-horn herds in England—that of Mr. T. Holford. The cow—whose head is finely represented—is Baroness Oxford 3d, grand-daughter, in direct line, of the celebrated cow, Lady Oxford 5th, belonging to the Holker herd. On the other side, her sire was the famous Duke of Hillhurst, who won added renown for the Kingscote herd. The young bull whose striking portrait we present, is the Duke of Leinster. On the side of his sire, he is a grandson of the cow of which we have just been speaking; but on the side of his dam he belongs to the Airdrie family of the Duchess tribe. His dam, Duchess of Airdrie 7th, was bred in this country by Mr. Albert Crane, of Kansas. The Duchess was the oldest of the Bates' tribes; while the origin of his Oxford tribe may be put at 1834, with the birth of the Oxford Premium Cow.

Dairy Husbandry.

WINTER BUTTER MAKING—NO. 4.

HENRY STEWART.

Washing the Butter.

AFTER the churning comes the final working and packing for sale. Butter that has been well churned is easily cleansed and freed from the butter-milk. There is a point in the churning at which the butter is in the best condition for washing. This is when it is in the state known as small butter. This may be produced in any churn, but it comes best in those which are without dashers, and in these over-churning is not so easy as in the dash churns. The point when churning should be stopped is when the butter is in small lumps about the size of a pea. Then the butter-milk should be drawn off through a strainer which catches the small particles, and these, if amounting to but half an ounce, are worth saving, as one cent even will not come into one's pocket without working for it, and this saving will pay for the salt and for pails in a very short time. The butter-milk having been drawn off, I turn in pure cold water, and give two or three turns to the churn and then draw off the milky water. This is repeated until the water comes away clear. Some excellent butter-makers wash the butter in cold brine and work and pack it directly from the churn. I would rather take the trouble to salt the butter in the butter worker, and put it away for 24 hours, during which time I think the butter ripens and improves in flavor. The color certainly deepens, and the texture is made more solid by the subsequent working. By adding three-fourths of an ounce of salt to the butter as it comes from the churn, and working this in, and setting it away for one day, some water is drawn from it, which is an advantage to the consumer at any rate; at the final working an additional quarter of an ounce of salt to the pound is added. It is very important to use the first quality of salt. So much has been said about salt of late in dairy conventions and elsewhere that the subject has lost its savor, and one is tired of hearing of this or that salt being indispensable. Every butter-maker should get the best, irrespective of cost; for one cent's worth will season 16 pounds of butter, and the saving of a dollar on a bag is hardly to be considered in comparison with five cents a pound difference in the value of the butter. Each may try and choose for himself. But in choosing salt, that should be avoided which has small, thin, hard white scales in it. The salt should be finely ground, white, of even fineness and free from specks of any kind.

As a rule, when one is doing well in making butter, especially in the winter season, it is best "to leave well alone," for changes often seriously upset things. Some salt has particles of lime in it. If there is but one per cent. of lime in the salt, there will be one lime particle to every 99 of salt. A hundred particles of salt are spread through a very small piece of butter, and as each lime particle will make a white speck, it is very easy for the appearance of good butter to be changed for the worse. In making microscopic examinations of samples of butter recently, the presence of lime in some of them was quite plainly shown by a whitish, mottled character from which others were quite free. And touching on microscopes, I might say that a dairyman would find a $25 instrument a source of much interest and instruction in his business as regards milk, cream, salt and butter. The modern butter workers are labor-savers. To work up 20 pounds of butter with the old-fashioned dish and ladle, is a tiresome job and wearies many a conscientious woman's hands and arms; and it does not seem a fitting business for a man to potter with a butter ladle. Twenty or fifty pounds of butter may be worked in a butter worker with ease, and in a tenth part of the time required with the ladle. And in using the worker, it is necessary to use the same cutting and gashing manner of working the butter as with the ladle, and to avoid drawing or sliding the worker over the mass. The right action is to cut off slices from the mass and press them together to form a new mass.

MR. HOLFORD'S "DUKE OF LEINSTER."—FIG. 97.

Packing the Butter.

Good butter should be put into good packages. I have seen excellent butter sacrificed because it was put up in an unattractive shape. The old-fashioned oval rolls, or round lumps, do not sell well.

Fancy prints and cakes are popular for retailing from grocery stores, but these are apt to be mussed in the carriage and handling, unless packed in a costly manner. After trying many methods of packing, I found the five or six, and ten or twelve-pound pails, made neatly of white oak, with close covers and handles, as the Welsh pails, and should be neatly made and varnished.

The best market for winter-made butter is that which supplies private families who are ready to pay five or ten cents per pound above the highest market rates for such butter as may suit their tastes, and is packed in convenient form for use and to avoid waste. The average dairyman need waste no time in pursuing the *ignis fatuus* of "a dollar a pound" for his butter. There may be a large discount taken from that value. This *may be* the retail price in some instances, but in regard to one noted and much puffed dairy, it has been stated that a discount of 40 per cent. was made from the "dollar a pound," and this sort of business savors of "ways that are dark," and has misled and troubled and dissatisfied many persons whose product has been equally gilt-edged with that of the most favored dairies. A dairyman should be content to sell his product at first for what it will bring; let him, however, put his name on every package, and if the butter is sufficiently good, those who eat it will find it indispensable and "cry for more." Then comes the tide in the affairs of dairymen "which taken at the flood leads on to fortune." Then he can say, when pressed with orders, "I want more money for my butter" or I cannot supply you; or, as happens now and then with me, those who get the butter will order direct from the dairy, and the dairyman may make his own terms. Butter is an article of prime necessity. It flavors the staff of life. There is no other such educator of taste.

When a person has eaten choice butter he becomes an expert and views an inferior article with totally new ideas. It is as though a blind man once sees the blessed sunlight and instantly appreciates the depth of darkness from which he has emerged; or, as a deaf man might feel, who is suddenly endowed with power to hear the sweetest music. So the man who eats the best butter becomes a confirmed consumer of it and thus the demand for this article spreads and grows constantly as the supply increases. To make choice butter is my business. From feeding the cows, through milking and all the rest of the work my hand is in it. From it I look for a profit on my investment in farm and stock. Nevertheless, so

MR. HOLFORD'S "BARONESS OXFORD THIRD."—FIG. 98.

the most convenient and popular. The butter is not exposed to air or dust; it will keep good for months if required, being protected from air by a covering of salt and paraffine paper; the butter can be cut from the pail as it is needed; the pails may be packed in a cheap box, and may be carried 1,000 miles with perfect safety and can be returned to the dairy, or sold, if desired, for what they cost the dairyman. When shipped to a near market, they can be returned as "empties" at low rates, and the total cost for carriage need not be more than one cent per pound. Pails of this size are convenient for families, as they last two or three weeks. Larger pails may be chosen, but they should be made of white oak, or of spruce, such

When a person has eaten choice butter he becomes an expert and views an inferior article with totally new ideas. It is as though a blind man once sees the blessed sunlight and instantly appreciates the depth of darkness from which he has emerged; or, as a deaf man might feel, who is suddenly endowed with power to hear the sweetest music. So the man who eats the best butter becomes a confirmed consumer of it and thus the demand for this article spreads and grows constantly as the supply increases. To make choice butter is my business. From feeding the cows, through milking and all the rest of the work my hand is in it. From it I look for a profit on my investment in farm and stock. Nevertheless, so sure am I that the demand can never be filled that I would be willing, nay glad, to instruct my neighbors in the art, as I am here trying to do. It has been said that horticulture enlarges a man's soul; makes him sympathetic and intensely generous and liberal. I have noticed the same traits among dairymen; unselfish liberal-minded men are they, who never forget to do good, and to communicate; and such a sympathy and good feeling I hope always to see among my fellow dairymen and competitors, of whom "the more the merrier" so long as they keep to the top of the ladder. If I shall have helped by these papers to enthuse one of them with the ambition to excel in butter making at a season when the labor is the most profitable, I shall have been well repaid.

Field Crops.

LEGUMINOUS FORAGE PLANTS.—No. 3.

PROFESSOR W. J. BEAL.

SPOTTED MEDICK — Medicago maculata — The leaflets of this plant are three, with a purple spot on each. The plant is a rapid grower of some interest and value. It was introduced with wool into waste places. The curved pods are fringed with a double row of prickles.

MELILOT—Melilotus. — There are two species in cultivation, the yellow, M. officinalis, and the white, M. alba. They are both tall, upright annuals in this climate. They were once grown as forage plants in England; but they are not much liked by cattle on account of a bitter taste. In Switzerland and Germany they are much grown to give a peculiar flavor to a certain brand of cheese. For this purpose the flowers and seeds are bruised and mixed with the curd before pressing. The previous item is taken from Sowerby's Useful Plants of Great Britain. It is also stated in The Treasury of Botany. The flowers of the plants are among the best for honey bees

SANFOIN OR SAINTFOIN — Onobrychis sativa. — This is a perennial herb, the roots having been known to last fifty years. The leaves are pinnate; the flowers grow in spikes; the pods are wrinkled and contain one seed each. It has long been much cultivated in England, France and some other portions of Europe. It looks somewhat like lucerne, and, like that plant, sends down a woody root to a great depth. It is not much pastured, but cut for green food or made into hay. At Lansing, Michigan, a few plants have been grown each year. In most cases they have not lived through the cold winters. I do not know that the plant is of any value as a forage plant in the Northern States.

VETCH OR TARE—Vicia sativa.—This plant much resembles small peas, except that the plant seems more delicate or slender. Sowerby says: "This vetch has been grown from remote times in southern and central Europe as a fodder plant, and has been cultivated here (in England) commonly at least as far back as the time of Ray. It is probably not indigenous. It is an annual, growing two feet high. The stem climbs by tendrils, like peas." It is sown from March to May, and cut for soiling. Horses, cattle and sheep are very fond of it. The seeds are sometimes used for feeding poultry, but are not fit for human food. I have raised some vetches for the past six years. They amount to but little. They are small, feeble, and are much damaged by our hot weather. I think we have several wild species which are worth more to us than this foreigner.

LUPINES.—Lupinus albus.—This plant thrives to some extent in some portions of our country. Each of these species or varieties has failed to mature seeds in Central Michigan. It thrives in climates like Italy and Sicily. The leaves have five to seven leaflets. The plants attain the hight of two to four feet. We have one kind, L. perennis, east of the Mississippi, and many more still further west.

FURZE, GORSE OR WHIN.—Ulex Europæus. —This is a small, prickly shrub bearing yellow blossoms. When cut annually, and the stalks bruised to deaden the prickles, it is fed to stock, especially horses. It is probably nearly as good a forage plant as our large bull thistle. It grows on poor, sandy soil, and is often cut for fuel. At Michigan Agricultural College it grows with difficulty. Some survived one of our mildest winters.

DYER'S WEED —Genista tinctoria.—This low shrub is sometimes eaten by stock in Europe, but is of no value for forage.

KIDNEY VETCH, OR LADIES' FINGERS.—Anthyllis vulneraria.—This is a low herb abundant on the chalk hills of England. Sheep are fond of it, and some use is made of it as a fodder plant.

BIRD'S-FOOT TREFOIL.—Lotus corniculatus. Sutton of England says of this:—"A very productive perennial plant, particularly suitable for dry, heathy and sandy soils. It is eaten with avidity by cattle, and also by sheep." I have not been able to grow any except

feeble specimens of no value. It is recommended in Europe to mix seeds with other leguminous plants and grasses for permanent pastures.

Several other species of several different genera of leguminous plants are more or less raised for forage, and, quite likely, still others, not yet tried, are valuable. Enough has been written to carry out the statement made at the outset that the order Leguminosæ, is remarkable for its valuable forage plants.

FAILURE vs. SUCCESS WITH ROOTS.

What They do for Stock—Turnip Experience and Importance.

COL. F. D. CURTIS.

Our First Experience With Roots.

To raise roots successfully requires experience. This is perhaps the first essential, the other requirements being rich land and good tillage. No crop of roots will do well without both of these conditions being complied with. No man who does his work in a slipshod manner, on the broadcast plan, letting a crop take care of itself, need ever expect to grow roots successfully; for he will not do it. By these precautionary remarks we do not desire to be understood that it is a pressing, tedious and never-ending job to grow a good crop; but that the work must be done right at first, and done well all the way through.

To illustrate—the first time we undertook to grow swedes we never harvested one, as the seed did not grow. We rolled it in, and as the weather was dry, it did not come up. Our first crop of mangels were neglected until a wet spell coming on they could not be cultivated, and when at last the ground got dry enough, we had to mow the weeds before the cultivator would go through them. That crop of mangels—a small one—cost us 25 cents a bushels. It was our beginning. We read an old speech the other day made about this time in which we took ground that roots did not pay. Years afterwards, when we came to see how easily they could be raised, we tried again, going slowly at first, and profiting by experience. We can now, take one year with another, raise swedes and mangels at less than five cents a bushel.

Feeding Value.

A bushel of mangels will feed a hog for two days, and a bushel of swedes will make food enough for a little more than a day. We mean for a full-grown pig; such as a breeding sow. A bushel basket of turnips and mangels filled three times a day, feeds four breeding sows in one pen. A peck a day of swedes fed to the oxen with hay in the morning and straw the rest of the day, has kept them in fine condition. Esquire Davidson said recently they were fair beef, and these oxen have done a good deal of work. A bushel of turnips fed to fifteen sheep morning and night has made them into prime mutton. They had nothing else but hay. The calves, with five quarts of roots each and two quarts of buckwheat bran, are growing as in summer time, and the cows with a peck of roots and four quarts of bran, gain in flesh, having hay but once a day and straw the rest of the time.

Our Prospective Crop.

Roots have gained in favor with us during the past ten years—since we have raised them with success. Each year we have enlarged the area and next year we shall double it, putting in five acres of sugar-beets and mangels and two acres of swedes. We want two acres of sugar-beets of Lane's Improved to feed the pigs in the early fall, and the mangels to winter the hogs on, reserving the swedes for the sheep and cattle. We shall sow flat turnips in the corn, and have a patch of an acre or so besides. These are for the sheep and store pigs to feed on until winter sets in. The patch will be fed on the ground and so will those in the corn field, as it hardly pays to handle flat turnips or to bestow much labor upon them, as other roots are so much better. When they can be put in broadcast and fed on the ground, there is no crop which will pay better for the cost or furnish us much feed at the time of year as flat turnips. One can afford the manure and the labor expended on the ground, as both put it in most excellent order for any crop the next year. With this system of culture there is no hand labor at weeding, which is always costly.

Putting in the Crop.

If possible the ground should be plowed twice, with an interval of a week or more, to give the weeds a chance to start and be killed by the second plowing. The manure should be harrowed in and the seed slightly covered. This may be done with a coarse harrow or by dragging brush over the ground. A pound of seed is enough for an acre if the ground is mellow and so free from lumps and clods, so that all of the seed will be likely to come up; but if not, then double the amount of seed should be sown. This crop may be put in the last of July or the first of August, and may follow a crop of spring wheat, barley or early potatoes. We should never think of devoting a piece of ground the whole season to flat turnips. It should always be a second or a supplementary crop. In the spring is the time to make calculations for it by putting in barley or some other crop early to mature, so it can be gotten out of the way in time for the turnips. Turnips in the late fall are as useful to fill out the frost period as sowed corn is to make up the deficiency of the summer drought. Both extra crops we think essential, and the farmer who neglects to provide for these times of shrinkage in the pail and growth, loses a considerable part of the profits of the season, which he could so easily prevent. We would not spare the manure on the spring crop where turnips are to follow, or when the turnips are put in. The manure gives them a vigorous start and this sends them ahead of the fly, and makes a growth very soon, which covers the ground and makes them independent of drought. Plenty of manure keeps the ground moist. This manure is not lost or exhausted with the crop of turnips, for as the roots derive a considerable part of their growth from the atmosphere, it remains in the soil to feed the next crop. Clover sod may be turned over, after the hay has been removed, for a crop of turnips or swedes. Plaster sown broadcast over the turnips during the season is beneficial. A light sprinkle as soon as they come up, is stimulating, and again a few weeks afterwards. There is no danger of any kind of stock hurting themselves by being turned upon the turnip field. They are loosening in their action on the bowels, which has a good effect in connection with eating the frost-bitten grass and dry grasses which are apt to clog the stomach and are always indigestible according to the degree of dryness and lack of succulency. The first root crop to think about, then, is that of turnips by setting apart a field, or part of a field, in which it may follow some early spring crop, and the first one to be put in is Lane's Improved sugar-beet, followed closely with the mangels.

Doura and Chufas.

MR. JAMES J. H. GREGORY writes us as follows: "I am glad to find you editors have begun to understand the merits of Doura and Chufas. I have grown the latter on my farm for a dozen years. They will ripen here (Marblehead, Mass.) on warm, light soil *every season* and can be grazed for green fodder and be used for hogs—only the season being shorter, the grazing season is shorter also, and hence they have not for hogs the same value here as in the South. The Chufa is also a very nice nut for children to raise—they are capital."

[We would ask Mr. Gregory if his Doura develops more than one stalk to a seed?—EDS.]

Horticultural.

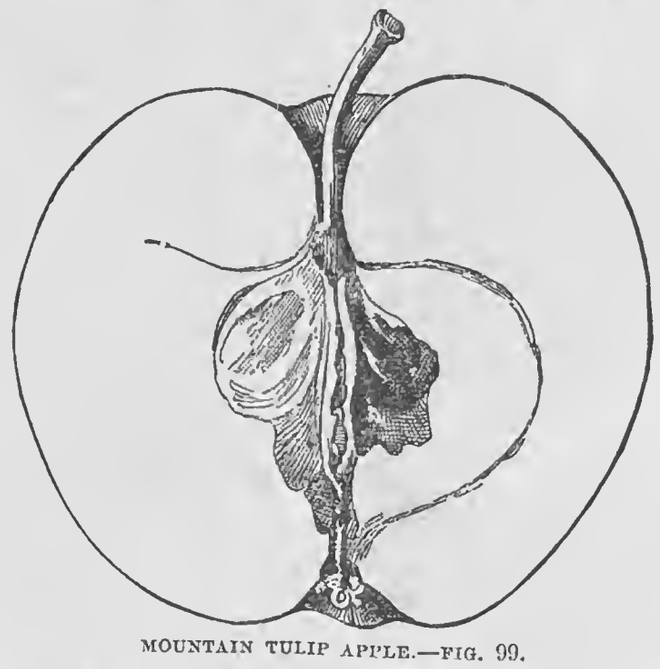
THE FARMER'S GARDEN.

As the busy season opens and the spring work begins, let us not forget our gardens. There are few things about the farm that will add more to household comfort and economy than a good, well managed kitchen garden. By a good garden I mean a successful one, that will contribute something good in the shape of fruits and vegetables to the table every day through the season. Too many of our gardens are failures, because they are either neglected or receive improper care. Eternal vigilance is the price not only of liberty but of everything that is good, and if a farmer has a good garden he must exercise considerable vigilance and care. Farmers usually have enough necessary work outside the garden to fill every hour of time. On many a well managed farm, where field crops are planted, cultivated and harvested in the best possible manner and all the "farm work" is carefully attended to, we find the garden a neglected, repulsive place, overgrown with various weeds and seemingly entirely forgotten. It seems to me that this is an oversight. We should not neglect the garden any more than our corn, wheat and potatoes. When the press of work comes on, the garden should receive its share of attention and not be allowed to suffer from neglect.

One cause for neglected gardens is the inconvenience in using horse power in the cultivation. In selecting a place for a garden and in planting it, we should aim to make horse culture available. The amount of work necessary to cultivate an eighth of an acre of garden is very considerable, if it must all be accomplished by hand, and it is more than the farmer should attempt. A garden should never be cramped by fences. It should be as long and narrow as possible, so as to make little turning at the ends of the rows when cultivating. Several different kinds of vegetables may be planted in the same row without harm, and if so planted, with the exception of onions, lettuce and a few other articles, may be cultivated more easily and expeditiously by horse power than by hand. I don't mean that the hoe is to be entirely laid aside in any instance; but I believe that much hand labor might in this way be avoided in our gardens.

The garden should be a rich, well drained plot of ground, containing as few weeds and weed seeds as possible, and it should be kept free from the pests by not allowing them to grow and mature their seed. Those who have not already ordered their garden seeds should make out their lists and send them at once. Store seeds are not to be depended on. It is much safer to send directly to some reliable seedsman. G. A. G. JR.

CHEMUNG CO.



MOUNTAIN TULIP APPLE.—FIG. 99.

Pomological.

The Mountain Tulip Apple.

THIS gaudy fruit is well named, its stripes and shades, as well as its shape, closely simulating the flower from which it is called. The Mountain Tulip originated as a seedling on the slopes of Yamaska mountain, near Abbottsford, Quebec. It is a very good as well as a showy fall apple of the month of October. It is one of medium size and mild, sub-acid flavor, mellow and agreeable, with some aroma. The tree is hardy and productive. We have many apples of this season, but even for decorative purposes a tree or two of this variety would be valued in the grounds of many growers. The tree itself is thrifty and symmetrical, with the evenly drooping branches characteristic of a heavy bearer. The shape of the apple is not unlike that of the Chenango Strawberry apple, but the size is less. T. H. HOSKINS, M.D.

Orleans Co., Vt.

Souvenir du Congres Pear.

The introduction of this exceedingly promising Pear to the American public, is believed to be due to Ellwanger & Barry, of Rochester, N. Y. Although it has been growing upon our grounds for several years, it has, so far, failed to show fruit. It has been in the hands of various growers in this country for more than a decade. Mr. Barry exhibited very fine specimens at the session of the American Pomological Society, in 1873, at Boston, he having then fruited it three years. He characterizes the tree as a moderate, upright grower; very productive. I very well recollect the wonderfully large size and fine appearance of the specimens shown by Mr. Barry at Chicago in September, 1875. I have not tried it on quince stocks; but it is reputed to be unsuccessful, unless double worked. I do not regard it as likely to take a high position so far as quality is concerned; although it has not the objectionable, musky aroma of the Bartlett, and, while it is earlier in ripening, it, like that old popular favorite, is quite exempt from the tendency to decay at the core. I regard it as pretty sure to take a high position as a market fruit preceding the Bartlett, unless its apparent tendency to overbear shall prove a bar to its popularity by seriously affecting the size, and possibly the quality of the fruit, or the longevity of the tree.

[See cut in last issue.—EDS.] T. T. LYON.

Scientific and Useful.

THE BEHAVIOR OF PHOSPHATES IN THE SOIL.

PROFESSOR G. C. CALDWELL.

IT is a well established and universally accepted principle of vegetable physiology that no food can enter the plant except in the liquid or the gaseous form; that there are no orifices in the roots or leaves by which particles of solid matter can be admitted within the cells and enter the laboratory where the mysterious and wonderful work is carried on of converting dead mineral matter into living vegetable substance. In an ordinary arable soil there is comparatively little plant food that is soluble in water, while there may be hundreds or even thousands of pounds to the acre of insoluble compounds of nitrogen, potash and phosphoric acid. Moreover, when soluble compounds of these important substances are added to the soil they are usually in a short time almost completely converted into difficultly soluble compounds, with the single exception of nitrogen in the form of nitrates.

This interesting property of soils, in virtue of which they seize hold of, and retain in the uppermost layers, the constituents of our manures, is evidently, from one point of view, a useful property, in that these substances are thus protected from being leached out and entirely lost for present use, through porous subsoils or drains; hence no notable quantity of ammonia, potash or phosphoric acid is ordinarily found in the drainage water even of well manured land. But from another point of view it might naturally appear to be a worse than useless property, since it opposes our efforts to increase the supply of soluble plant food for our crops; but the widespread and constantly increasing use of soluble phosphates and soluble compounds of nitrogen and potash, shows that there is profit, nevertheless, in putting soluble plant food into the soil. How shall we dispose of such an apparent contradiction, and reconcile known facts concerning the behavior of soils and the structure of plants with our results in manuring crops?

It was Liebig who performed the first experiments leading to the conclusion now so generally adopted by vegetable physiologists, that plants have, to a certain extent, the power of making their own solution. The feeding rootlets of the plant are in closest contact with the particles of the soil in which they grow, as may be seen on carefully pulling up a young plant from a dry soil; the youngest rootlets, and the root hairs will be found to be sheathed with a coating of particles of soil which cannot be shaken off, and not even pulled off without in some cases taking with them portions of the rootlets. These rootlets and hairs are saturated with sap, a liquid that has a greater solvent power than pure water or than soil-water, and as a result of their close contact with particles of difficultly soluble phosphate of lime or iron, or difficultly soluble compounds of ammonia or potash, these substances may be taken into solution, and under such conditions that they cannot but enter the plant right then and there.

But, it may be said, if soluble phosphate is converted into insoluble phosphate in the soil, why take so much trouble to make insoluble phosphate soluble before applying it? Why not use the powdered rock phosphate or bone dust directly, instead of first treating it with acid? Because in the former case we have a particle of the phosphate among ten thousand of soil, which the rootlet may have but one chance in as many thousands of meeting, while in the latter, as the soluble phosphate is taken into solution by the first rain that thoroughly wets the soil, it is distributed throughout the upper layers to a considerable extent before conversion into insoluble compounds, and is spread over the surface of such a great number of particles of the soil that the rootlets are constantly meeting with it as they press onward in their growth. That the effect of a given quantity of phosphoric acid as soluble or superphosphate, applied to a soil, for instance, that is suitable for wheat, is in most cases very much greater than that of the same quantity in powdered rock phosphate, however finely it may be ground, has been fully demonstrated by both experience and experiment, and it is easy to see the reason why in the above explanation.

The behavior of phosphates in the soil has received a careful study recently at the hands of Albert and Vollbrecht at one of the German Experiment Stations, and some useful conclusions can be drawn from the interesting results that they obtained. It may be necessary to state, first, that there are three phosphates of lime, one soluble in water, another, the so-called reverted phosphate, difficultly soluble in

water, but soluble in water containing ammonium citrate, and a third very difficultly soluble in anything except acids; the second form is more valuable than the third for plant food, and is unquestionably more easily taken into solution by direct contact with the rootlets. Albert and Volibrecht first compared soils rich and poor in lime as to their behavior with soluble phosphate; in a soil rich in lime 78 per cent. of the phosphoric acid became insoluble in water in four hours, and after twelve hours 90 per cent.; but none was insoluble in citrate, so that the change had reached only the second degree of insolubility; at 14 days, when the last examination was made, 95 per cent. of the acid had become insoluble in water, but only four per cent. was insoluble in citrate; therefore while nearly all the acid was fixed in the upper layer of soil, nearly all of it was still in a form easily accessible to the plant through contact with its feeding rootlets, and was also distributed over the surface of a large number of soil particles. In a soil poor in lime, with but about one per cent. of carbonate of lime, after 14 days only 42.5 per cent. had become insoluble in water; in another soil with 0.5 per cent. of carbonate of lime, 32 per cent. of the phosphoric acid became insoluble in the same time; therefore in the one case more than half of the acid was in a condition to be carried off by a soaking rain, and in the other two-thirds of it might be leached out.

The inference from these results is that the use of high-grade superphosphates rich in soluble acid, on sandy or clay soils poor in lime, is not judicious; and this inference is supported in a conclusive manner by the fact that in localities in Germany where such soils predominate, the use of superphosphates has fallen off by four-fifths since the introduction of the high grade wares; the farmers have not found them profitable, and have substituted for them bone-meal or raw Peruvian guano, both of which contain within themselves some provision for the solution of their phosphate. For the same reason the use of crude Peruvian guano is better on such soils rather than of that which has been treated with acid, or the refined guano, as they call it in this country; the treatment with acid converts a large portion of the phosphate in the guano into superphosphate. The same investigators found that in soil from newly reclaimed bog-land, the soluble phosphate was not fixed at all, and that, moreover, the phosphate soluble in citrate was rapidly converted into phosphate soluble in water by the humus compounds that abound in such a soil; hence on such land the use of rich supers would be injudicious.

These conclusions are confirmed by results of experiments with phosphates on a large scale on sandy soils and reclaimed bogs, where it was found that just as good results, and in some cases even better ones were obtained with phosphate soluble in citrate, or reverted phosphate, as with superphosphate. These considerations may serve to explain some of the failures in the use of superphosphates, and to suggest in such cases the trial of liberal dressings of bone-meal.

Farm Topics.

WESTERN FARMING—III.

W. I. CHAMBERLAIN.

I PROMISED to give some account of the scenery and the farming lying along or near the line of the Cleveland, Mt. Vernon and Columbus railroad. The scenery is some of the finest in Ohio. Though the C., C., C. and I. road to Cleveland is nearly parallel to this for quite a distance northward from Columbus, that road seems to have had an instinct for level ground, and this for hills. The C., C., C and I. road goes through much flat "low" land, and yet it is not low. It is really the water-shed or back-bone between two systems of creeks and rivers, nearly all the way from Cleveland to Columbus. But it is a very broad and flat "back-bone," and needs under-draining just as much as if it were a few feet or a hundred feet lower down. Any soil needs under-draining if the water stands on the surface or even a foot below the surface much of the time. The highest land on the writer's farm is nearly a dead level and greatly needed, and was vastly improved by, drainage. And the same may be said of this long, flat stretch of a hundred miles or more between Cleveland and Columbus on the C., C., C. and I. road. Really good farming, fine farming, fine stock, good buildings, good clover and successful rotation of all kinds of crops will never be found here, I think, without the tile-drainage of considerable portions of the area. And I am delighted to find the work already fairly begun, and tile factories already existing in considerable numbers.

But the C., Mt. V. and Columbus road strikes boldly off through hills and valleys and across streams in a most delightful way. You would think yourself in Vermont, so high and steep are the hills, rising to an altitude of six or eight hundred feet above the level of the immediately adjacent valleys. Only for a short distance, however, is the scenery so bold, and the hills so steep as to prevent cultivation. Soon, as you whirl on north through Knox and Holmes counties, the hills grow less bold. They are fine, indeed, but arable to their very tops, and covered with fine fields of wheat. The soil is gravelly much of the way, and does not need artificial drainage, and one can afford to plow the hill sides, with that advantage on his side. And it is not at all surprising that the farming is more advanced and really satisfactory here. There are few better counties for farming anywhere than portions of Knox, Holmes, Wayne and Summit, through which this road passes, and Stark, of which it barely touches a corner. And there are few better farmers than the "honest Dutchmen" who till the most of this good land. One could almost imagine himself in the fine farming region of Eastern Pennsylvania described in the first of these articles.

Stark Co. is perhaps, on the whole, the best for general tillage. The fine, large bank barns, huge straw stacks, rank clover and other grass in its season, sleek cattle and horses, and fine fields of waving wheat, oats, barley, rye and corn, that cover its rolling surface in summer, fill with delight the eye at all trained to beauty of agricultural landscape. I find less to criticise and more to admire and heartily commend in the farming here than in almost any region I have visited. Possibly "distance lends enchantment to the view," and I might see more faults if I lived in the midst of the regions I now know only by occasional inspection from car windows, or from a buggy, as I have driven through. But the farmers of these grain regions seem to me to come more nearly up to my ideal of good farming, and to what their land is capable of, than we at least do in the clayey dairy regions of the Western Reserve. They develop Nature's resources of fertility better than we. They do it more than we by clover, rotation, thorough tillage, the use of lime, gypsum, etc., and by the careful saving of manure from animals.

Their great, warm barnyards are the very paradise of fat cattle and young stock. Their cattle are largely wintered on *corn* and *straw;* for experience long ago taught them what chemistry only lately demonstrated, that these two feeds complement each other exactly, and together make a complete fodder. Those great, warm barnyards, too, are both laboratories and store-houses of fertilizers. Straw is in superabundance. The farmers feed all they can, use all they can as bedding in the stables at night, and spread it over the yard to be picked over by cattle and fowls (and sometimes pigs) all day, and gradually tramped into manure with the droppings and urine of the stock. It makes a great mass of not very rich manure, but in a properly constructed barnyard, where there is neither eaves' wash nor leaching through the soil beneath, and where the straw stack is systematically worked down just fast enough, we have about as near an approach to the perfect utilizing of the feed and straw of the farm as it is possible to get without more labor than our prices of land and produce will warrant.

These old farmers know nothing about the scarcity of bedding and absorbents so common near the seaboard, and until very lately in the Ohio dairy regions. They scout the idea of raking up leaves or road dust for absorbents. They would as soon think of handling straw with a spoon. "Vy, man, it von't pay! And den, vot should ve do mit to big straw stack?" They have little to say of the barbarity of stanchions, but they have their opinion of the man who will let his cattle and horses sleep on a bare, wet floor. They think that man is just fit to sleep on the floor himself.

About the only improvement I would suggest to the excellent grain farming of much of this region, would be an increase of the amount of live stock. They have abundant room to stable it in the basements of their huge bank-barns, half of which is now often nearly useless and nearly a third part "left out-of-doors" as I have elsewhere remarked. They have, too, an abundance of grain and of straw for feed, with clover and timothy for change. And cattle are just the machines to turn this coarse fodder rapidly and profitably into good manure, *good*, of course, just in proportion to the amount of grain, shorts, clover, etc. fed, and the care with which the urine is saved. I have elsewhere strenuously and repeatedly argued that the only salvation or at least renovation of our clayey dairy farms, is the drainage of portions of them, and the gradual increase of their grain-area, with the careful use of straw, chaff, etc., as bedding and absorbents; I now argue and believe that though the case is not so bad on the grain farms I speak of, yet a large increase of the live stock would, if properly managed, be a very great benefit, and would greatly increase the resources of the farms. Nature has made almost any of our farms rich enough in available or latent fertility, and has set us the task of wisely developing, using and increasing it.

The Apiarian.

AIDS AND HELPS TO BEE-KEEPERS.

AT the outset I wish to state that I shall not, perhaps, present anything new to experienced bee-keepers, but simply hints and helps to beginners. I am almost constantly receiving letters from those who seek to know the best way to commence bee-keeping. Many seem to think it a matter requiring much knowledge and instruction. One of the most frequent questions is: "Would you advise me to undertake it without previous study and some practical knowledge?" The answer to this is plain. If you wish to keep cows, you buy cows, and begin to learn to milk by milking them. If you wish to keep poultry, you buy as many fowls as you can afford, and having done this you are interested to know more about their proper care, and you read about them, watch them, and are a poultry keeper without more ado. I advise you to go about bee-keeping in the same way. Buy a few stands, or even one, then get the theory from bee books or journals; watch your bees and continue the practise with the theory. There is nothing about the matter that is mysterious in a practical sense now, thanks to those who have practically investigated the "mysteries" for us. If you can afford to spend the money and can get Italian bees in just the right hives, that is, of course, the easiest way. If not, buy just what you can get, and as soon as convenient, transfer the bees to good movable frame hives and then Italianize. Decide what hive you will adopt, and do not allow yourself to think it must necessarily be a "patented" hive. The best hives, and those most widely in use at the present by successful and scientific bee-keepers, are covered by no patents, and can be manufactured at one dollar and a half each—or less. Always use good material, and knowing the dimensions of the hive you adopt, you can easily obtain widths and lengths that can be cut with little waste. A word right here to my old, experienced brother bee-keepers. You who have purchased hives etc., let me offer you a money-saving hint. Obtain a good foot-power saw, manufacture your own hives and save 50 per cent. You can easily cut up material for twenty hives per day. With it you can manufacture every thing needed, from a complete hive down to a "prize" dovetailed section box. The "Barnes" (Rockford Ill.) combined saw is good for this purpose. I have found it of the greatest practical benefit, and I doubt if there is, or can be, a more useful article to the apiarist than a thoroughly good foot-power saw. Beginners in bee-keeping will find it a pleasure to make their own supplies, and will take pride in doing it well, and carefully. That little "all" once in the Savings Bank, or the few dollars wisely laid away in the "ancestral-stocking," will come very handy by-and-by to purchase from your nearest supply dealer the honey and wax extractors, comb foundations, and other necessities for your apiary. One piece of advice I deem very necessary: Remember you cannot expect to begin where other people have arrived by years of practical labor and study. There is no "royal road" to success in this business, any more than in other branches of industry. Perseverance, patience, and, withal, a little courage, are the requisites. Skill will come in doing what is necessary, *and in no other way.*

J. G. BINGHAM.

McGrawville, N. Y.

Miscellaneous.

WHAT OTHERS SAY.

THE USES OF MANURE IN THE SPRING.—Many persons hesitate to draw out their manure and spread it until they are ready to turn it under supposing some waste to occur by exposure to the weather. It is very doubtful if this suspected waste really takes place, says our contributor, Henry Stewart, in the N. Y. Times. It is true that manure freshly turned or spread smells strongly, but in most cases there is no value or virtue in this scent. Decomposing mixed vegetable and animal matter, such as is found in the contents of a barn-yard, gives off much carburetted and and sulphuretted hydrogen, and these gases are those which escape most freely from manure-heaps. The scent of ammonia is not nearly so disagreeable as that of these gases, and is pungent to the nostrils and to the eyes. It is easily tested. By dipping a piece of red litmus paper in pure water, and exposing it to the vapors which escape from a heap of manure, the red color will be changed to purple if ammonia be present; or, if the ammonia is abundant, the color will become blue. It is very rarely that this effect can be noticed in the strongest-flavored manure-heap, for the reason that as water absorbs 700 times its volume of ammonia, and as fresh manure contains 75 per cent. of water, so long as there is any water not yet saturated with ammonia, none of this can escape into the air and be lost.

A TON of manure having 1,500 pounds of water in it, which is about 25 cubic feet it follows that it will dissolve or absorb about 17,500 cubic feet, of ammonia gas before it is saturated. Besides this, manure contains much sulphuric acid in combinations from which it will escape to combine with ammonia and in this way a large portion of the ammonia formed in the decomposition of the manure will be changed to sulphate of ammonia which is a stable compound.

THEREFORE the fear that ammonia may be lost is hardly to be entertained so long as the manure is moist: a day of warm wind and sunshine will certainly do mischief by evaporating the moisture, and this is the only risk of loss to be feared. It may be perfectly safe to draw out and spread manure in cold or showery weather at this season, but the work should not be permitted to go so far ahead but that it may be covered with the plow if the necessity occurs.

BUT in some cases the practice is convenient. Twenty loads a day may be hauled and dropped in small heaps, thus releasing the team from a waste of time in waiting while the manure is spread; and as soon as a certain quantity is dropped, a spare hand may be employed to do the spreading while the team is at work covering. From the foregoing it will be gathered that this work is essentially one for early spring. It may be done when the ground is too wet to be plowed, or while it is still crusted with frost. Better still, it may be done by means of sleds on the last snow with much economy of labor, and an onerous labor is out of the way before the hurry of plowing and sowing comes.

THE method of throwing the manure, as it is hauled out into small heaps, is sometimes objectionable and sometimes to be preferred. It is objectionable and injurious when it remains in that state for a lengthened period. It contains, when in the ordinary condition in which it is found at this season, about seven per cent. of soluble matter. One heavy shower falling upon a small heap of three or four bushels will wash out of it a large portion of this soluble matter, enriching excessively the small portion of the ground upon which it rests, and depriving the larger part over which it will finally be spread of its due share. The crop will show the result by an excessive growth in those spots where the heaps were placed. This excessive growth is an injury, and doubly so; a waste occurs in two ways; grain will lodge or be affected by rust or smut from rank growth in some places and it will be robbed elsewhere; in the same way, corn will run to stalk from over-fertility in these places, and make a weak growth in others. This is so obvious, and has been so often observed, that it is surprising that many farmers will persist in the practice.

TO DETECT OLEOMARGARINE.—One of the main difficulties in opposing oleomargarine is the want of an easy method of distinguishing the stuff from genuine butter. M. Donny has an interesting note on this question in a recent number of the Journal de l'Agriculture. Artificial butter, such as is met with in large quantities in commerce at the present time, behaves in an altogether peculiar manner if heated up to 150 deg. or 160 deg. C., equal to 320 or 350 deg. Fah., in a porcelain capsule or a test tube. At this point it produces but an insignificant quantity of froth, but the mass exhibits a kind of irregular ebullition, accompanied by violent starts or jolts, which threaten to eject the melted butter from the vessel. It turns brown, but this phenomenon takes place in the following manner:—The fatty portion of the sample preserves its natural color, and the caseous matter, which alone acquires the brown tint, separates from it in the form of clots attached to the sides of the vessel. Natural, unadulterated butter heated in the same manner, behaves quite differently. Heated up to the above temperature, it produces an abundant froth; the "jumping" is far less marked, and the mass turns brown under different conditions. A considerable portion of the brown coloring matter remains in suspension in the melted mass, so that the latter acquires the characteristic brown aspect familiar to those who are acquainted with the sauce called "*au beurre noir.*" In this respect all natural butters behave just alike. It is curious that such a simple test as this has never hitherto been pointed out as a suitable method of distinguishing true butter from artificial imitations.

JAPAN PERSIMMON.—Our readers may remember that the editor of the N. Y. Sun took us to task for the expression of an opinion that this Persimmon (Diospyros kaki) was not hardy in this climate. Now he states as follows:

We have before us a catalogue of one of our Long Island nurseries, dated 1844, in which

the Japan Persimmon is described, and the trees offered at the price of one dollar. More than twenty years ago we purchased and planted trees of this fruit, and althongh they lived a few years they were eventnally killed out during an unusually cold winter. We know of but one tree that ever reached a bearing age in this part of the country, and that one is now dead; therefore, from our own experieuce, we must set down the Japan Persimmon as rather too tender for the Northern States; and it is very doubtful if it will live eveu in Missonri. It is true that there are many varieties of it, some of which may be more hardy than others; but they are not yet known. We would say, try a tree or two if you can afford it, but do not place much confidence in what the tree peddlars (!) say with regard to hardiness of the trees. Of course the trees do well in the mild climate of California, but that is no recommendation for them in colder regions.

PACKING BUTTER.—Mr. Ellsworth, as reported in the Am. Cultivator, says, "There are usually a few weeks during each season when butter is so plenty in our small markets that it is almost impossible to sell it at any fair price, when it may be packed in earthen jars, and be kept in good condition for family use. Take the butter in as good condition as I have described; press it into the jar compactly in a layer three inches in thickness; cut a piece of cloth of the size of the jar, wet it in strong brine, spreading it over this first layer; repeat the process with each succeeding layer until you have reached the top or within three-quarters of an inch. Now make a strong brine, to which add three tablespoonfuls of granulated sugar, one teaspoonful of powdered saltpeter; set in a cool, dry cellar; keep it covered with the brine until wanted, and it will cut out smoothly. But if butter is to be kept for a better market, I would recommend putting it up in any sweet package or jar, direct from the churn in the granulated form, covering it with strong brine, and when wanted take it up and work it over like new butter."

HUMOR.—That only is perfect humor where everybody is pleased. Such was the happy humor in the well-deserved compliments on both sides between Judge Story and Edward Everett, when, at a Boston dinner, in response to the former's neatest of volunteer toasts, "Fame follows where Everett goes," Mr. Everett at once gave that unsurpassed impromptu, "To whatever hight judicial learning may attain in this country, there will always be one Story higher." *Per contra*, Lord Beaconsfield's humor, though brilliant, has too much ill-humor in it to be thoroughly good: it is conceived, flashed, or elaborated too much in the spirit of that statement of his, "A smile for a friend, and a sneer for the world, is the way to govern the world." Indeed, a man outlives his worth—almost his right to live—when he outlives his good-humor. Compute the value of the sun's radiant energy, if you can; and so of the radiant energy of good-humor in character. Hell itself would cease to be hell without ill-humor. Heaven? There can be no heaven without the good-humor that makes it heavenly.—Thoughts and Events.

IMPROVEMENT OF THE ROSE.—Mr. H. B. Ellwanger says:—"Much the same laws operate in the Animal and Vegetable Kingdoms. No experienced breeder of cattle or horses would think for a moment of depending upon chance results; he knows that by crossing this strain with that, he will obtain what he desires, and will be able in a great measure to know what the produce will be. By this knowledge we keep and improve our breeds of Jersey and Holstein cattle, our Hambletonian and Mambrino horses and secure variations in them, such as we desire. Why, then, do we not more generally pursue the same course in raising new fruits and flowers? In the production of new roses, instead of having exhausted the field, as a few writers have incautiously observed, we have only just entered it; the future possibilities open to the raiser of new Roses, are only dawning upon us. Lyons, France, is the head centre whence most of our cherished Roses have come."

THE experiment of bringing foreign beef and mutton from Australia, says the Mark Lane Express of London, has proved successful beyond all reasonable expectation. The butchers took very kindly to the meat, and "asked for more." It was bright in appearance and perfectly sweet when first brought into the market, and it has kept remarkably well. Fears have been expressed in its columns and elsewhere that the meat, after being thawed, would rapidly become tainted, but it is only fair to confess that the surmise has not proved correct. Mutton taken out of the refrigerating room on the night of Sunday week was quite sweet on Saturday, and a week is as long as there is any necessity for keeping imported meat.

IF the importation of this meat should be carried on extensively, our American cousins will be nowhere in the competition. They require £15 for such bullocks as can be bought in Australia at £5 each, and althongh their freight to this country is less than that which importers from Australia will have to pay, the difference is not nearly enough to make up for the large margin between prices at New York or Chicago and those which obtain at Sydney or Melbourne.

TO KILL LICE.—Col. Curtis has hit it. He tells the N. Y. Tribune as follows: "We have tried all sorts of mixtures *to kill lice on animals* and at last have hit on what we think is best: Melt hog's lard, or any hot grease, and in it dissolve salt one-third of the bulk of the greese; take as much grease as will be required to smear the animal all over and into the mixture pour kerosene oil and stir it up. Two gills of the kerosene would be sufficient for a cow of ordinary size. One application completely cured the most stubborn case of lice on an old hog. It leaves the skin smooth and clean, removing the scurf and healing the irritation caused by the parasites. It is also excellent for galls and sores.

SEED COTTON.—Once for all, then, says Home and Farm, we can not too strongly recommend to cotton growers, whether on a large scale or on a small one, that they select their seed from the young plants in the field, for they will find such a course not only economizes time, but also money, for it assures the excellent quality of the seed.

THE cotton seed so carefully chosen, and of whose vitality you are assured with as much certainty as of anything, should, before being sown, be soaked in water cantaining, in solution, soot or wood ashes; but, above all, we recommend soot a substance at the command of every one, which is a rank poison for all vegetable-eating insects, and drives away, by its rank and bitter taste, all sorts of devastating vermin.

If, after soaking the seeds in such a solution you dry them by rubbing through the mass soot to which a trifle of guano has been added, it will strengthen in pushing the germ, and you will have done all that is humanly possible to insure success.

HEREFORDS.—A well-known breeder of Herefords sends the Mark Lane Express the following note: "I have had a gentleman from the United States to see my herd of Herefords He tells me that he has just bought 53 for the States. He used to breed Short-horns, but after trying Herefords he has got rid of his Short-horns. Two of his brothers in the Far West of the States have each a herd of Herefords as good as any he has seen in England. The Hereford breed does well in the States, and is fast coming into use and favor there." The Mark Lane Express has often expressed the opinion that Herefords, bred as they are in England, would be likely to do better than Short-horns in the grazing districts of the United States.

LET ONE ENGAGE the Minister to the United States of any European kingdom in familiar conversation and try the experiment of abruptly asking him if it be not true that actual criminals as well as dangerous and suspected characters are habitally shipped hither from his sovereign's domain. Those who have investigated the subject know well that this is the case. Indeed a great many more than we suspect of those who debark at Castle Garden could join heartily in the refrain of the old Botany Bay convicts:

"True patriots we, for, be it understood,
We leave our country for our country's good."

—The Hour.

RAILROAD MONOPOLIES.—"And it is well," said Land and Home, "that the farmers, manufacturers and merchants are roused to action, for so long as legislation is controlled by Gould and Vanderbilt, so long must the sovereign (?) people submit to these, their rulers, confessing that their numbers, and honesty and justice, are of no avail against these men's money. Only by combining, however, can the victory be won. Combine in the club, in the grange, in town meeting and in city organization; then by vigorous, combined efforts at the capitol, justice may help those who demand it.

CHALLENGE.—Mr. William Crozier, of Northport, Long Island, believing his Jersey cow, Lillie Bonne, which took second premium at the late International Dairy Fair, to be the best in this country, will back up his opinion in the sum of $500 on her against any cow of any breed, for one week's production of milk, cream, or butter. The party accepting this challenge to put the same amount of money on his cow.—American Dairyman, as quoted in the London Agricultural Gazette. Does Mr. Crozier's challenge extend to England?

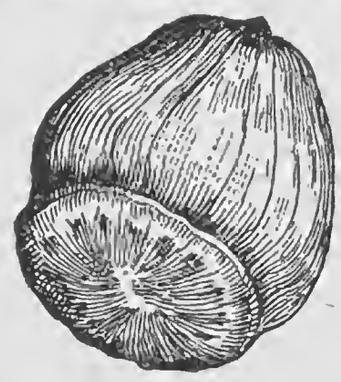
AT THE IOWA AGRICULTURAL COLLEGE every girl is taught how to make good bread and biscuit, and learns before she leaves that institution something about the characteristics and qualities of different flours, says the American Miller. This is a different and more useful "language of flours" than most girls learn, but then Iowa girls are different from most girls.

MR. TALCOTT (writing in the Country Gentleman) says: "There is one peculiarity about pumpkin seeds that has never been mentioned by any writer, and that is, while many think them detrimental if fed to cattle in excess, if hogs are allowed to eat all they will of pumpkin seeds, they will grow fat on them.

THE CALIFORNIA FARMER asks why in their State University they have only three or four agricultural students, and why in a State as rich as California they have no Agricultural College as was designed by the princely gift of the nation, yet they have no agricultural farm.

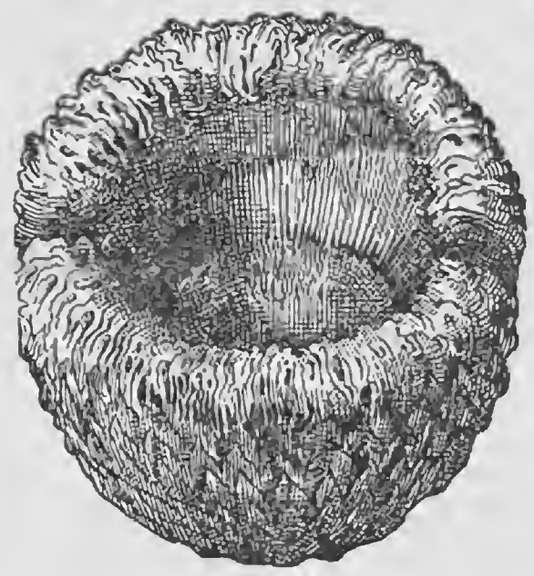
BUR-OAK ACORN.

THE Bur-Oak, (Quercus macrocarpa) also known as White Oak, Over-cup, or Mossy-cup, is peculiar for the size of the cup and acorn. Figures 100 and 101 present the natural size of a



ACORN OF BUR-OAK.—FIG. 100.

fruit sent us from Texas. It varies, however, in size from 9-10 of an inch to two inches across, but this being uncommonly large, our readers may be interested in seeing it. The tree is of middle size and quite handsome. It is found in nearly all parts of the United States, but is most common in the West. It loves rich soil, and the fertile Bur-Oak lands of the



CUP, NATURAL SIZE.—FIG. 101.

West are well-known for their excellence for farming purposes. The wood is hard and durable. Leaves large, from 6 to 12 inches or more in length, deeply lobed or nearly parted, irregular, downy and pale underneath. The whole tree has a striking appearance, and a few specimens on the lawn and around the buildings are not out of place.

CATALOGUES, ETC., RECEIVED.

G. H. & J. H. HALE. South Glastonbury, Conn. Catalogue of Small fruits of all kinds and fruit trees. An enterprising firm and trustworthy. It presents engravings of the supposed largest strawberry ever raised, and of the new quince "Champion." We take pleasure in commending the catalogue (sent free) to the notice of our readers.

PAMPHLET, 16 pages, of the Mapes's Manures. "Long Island Specials" prepared expressly for the soils and crops of Long Island. Reports from many farmers showing the effects of these manures. Also an essay by Charles V. Mapes upon "The Effects of Fertilizers on Different Soils," from the Annual Report (1879) of the New Jersey State Board of Agriculture. In this some very interesting experiments with potatoes are detailed. The RURAL NEW-YORKER is always glad to aid in the dissemination of such papers. Much light is needed on the use and effects of concentrated manures, and the farmer cannot fail to find in such accounts much information which may guide him how to use them. The circulars will be sent to all upon application for them. Address the Mapes Formula Co., 158 Front st., N. Y.

CATALOGUE of Clydesdale Stallions owned by Powell Bros., Springboro, Crawford Co., Pa. This neatly gotten up catalogue of 83 pages contains full descriptions and brief pedigrees of the 13 stallions owned by the above firm, together with a pithy history of this favorite breed. All who are looking for the best sort of working horses for every purpose we would strongly advise to apply for information here before investing in stock anywhere else.

FRANK FORD of Ravenna, Ohio, sends us a circular setting forth the value of his new tomato "Alpha" which he deems the earliest and best tomato known. Certificates of its merits are published from well-known horticulturists whose statements we cannot doubt. Also a circular of a cider preservative.

To Destroy Rats.

When in small numbers, these may be easily got rid of by placing food near their runs for a few nights till they have regularly devoured it, and then poisoning the same. But where they harbor numerously, poisoning is too slow an operation, and, moreover, there are generally some astute old fellows, that, prepare traps and poison ever so cunningly, are too wary to be caught by them.

One of the best methods I have ever tried under such circumstances, to catch rats, is to take four joist posts about four feet long, and nail 12 to 13-feet boards to them, about two inches apart from bottom to top. This makes an ample pen, which should be set near where the rats are most abundant. In setting the pen, put 4 inch square blocks under the posts, so that the rats can run under the lower board, easily into it. Now spread corn, oats, or any thing they are fond of over the ground inside the pen, then lay down three 4-inch square joists equidistant, and floor these with boards. Let the pen remain thus for a week or so, by which time the rats will have made it a great harbor for themselves. Now take the blocks from under the posts, and the lower boards of the pen will come so near to the ground that the rats cannot escape underneath, and being so high they cannot leap over. Then put in one or more terrier dogs, take out the floor boards, and you will see rare sport. I found upwards of 20 rats in a pen of this description one morning, and a small rough-haired terrier bitch of mine, killed every one in a few minutes. She would jump and catch the rat by the back of the neck, breaking it with a single grip. After she had done this, she went leisurely round over them, one after the other, and if she found any still kicking or showing life, she gave it another grip on the neck, and thus settled the matter with the rats.

It is astonishing what complete rat warrens many of our farmers make of their barns and outbuildings. Instead of having their sills and floors close to the ground, they should be raised two feet or more from it; cats and dogs can then easily run under and prevent rats and other vermin from harborbing there. A. B. A.

Industrial Implements.

THE HOOSIER GRAIN DRILL.

THE three main considerations in planting grain are:—effective planting, economy of seed, and the production of most grain to the acre. These three objects are secured by planting with a good drill, such as that we here present to the notice of our readers in the Improved Hoosier Grain Drill, manufactured by the Hoosier Drill Company of Richmond, Ind. The best experience is that the separate distribution of seed is as essential to the growing of large crops of corn as to the growing of large crops of cabbage. The drill under consideration drops, with great regularity, one grain in a place, and is so arranged that it can be adjusted to deposit them 12, 16 or 20 inches apart, to suit the requirements of various kinds of soil. It also, at the same operation, does the covering uniformly in depth, and its covering shares can be adjusted to cover deep or shallow.

There is economy in its use from the fact that no thinning is necessary, and no replanting either, in case good seed is used. The following calculation will fully demonstrate that no corn grower can afford to be without at least *one* good drill. Take, for instance, a crop of forty acres. An increased yield of ten bushels per acre, which is very moderate as the increase is often twenty bushels, will make a total increase of 400 bushels over hilled corn. This, at fifty cents per bushel, gives a *clear* gain of $200 the *first* season, as the time and labor saved will fully pay for the drill. At only twenty-five cents per bushel there is still a net gain of $100, which is a neat little sum.

An attachment for planting beans, peas, broom corn and sorghum goes with every drill, free of charge. We strongly advise all who may need a grain drill to write for full particulars of the above drill, which will be promptly furnished *gratis* by the manufacturers.

SINCE our full description of the Acme harrow, in the issue of Feb 14, we have heard quite a number of good reports of the implement from subscribers and others, and would certainly advise all in need of such a device to obtain a full account of this implement by applying to Nash & Bro., 22 College Place, N. Y.

Everywhere.

NOTES FROM AIKEN—(S. C.)

The bluest place on the face of the earth is a "Health Resort" in bad weather. The invalids growl as if they were suffering personal wrongs, and their long faces are in keeping with the gloomy skies. Nearly a week of rain or drizzle has, as a matter of fact, tried the patience of patient well people, and about the only enlivening thing to be found here in "Aiking"—as it has been with a grim facetiousness called—is the cheerful pine-wood fire in the old-fashioned open chimney-place. "It is an ill wind that blows no good." While the coughers are coughing worse, the land, from this week of storms, is receiving just what it sadly stood in need of. Strawberries were drying up and the thousands of rose-buds that were ready to unfold were looking as if nipped by frost. Now all this is fast changing. In a day or so, the gardens will be a mass of roses, while the buds of trees are swelling and expanding as fast as ever they can. Speaking of Roses, we have here Fortune's Yellow offered two or three years ago as the "Beauty of Glazenwood," first in England, then here. The colored plate of this "Glazenwood" was not only captivating, but was actually enough to set an ardent rosarian quite crazy, being about eight inches in diameter, of a lemon-yellow color striped with red. But its identity with Fortune's was soon discovered, and its buds (unlike those of the American Banner) never came to be worth their weight in gold!

A very common method of raising potatoes here is as follows:—Prepare the soil in the usual manner and plant pieces (cut to single or double eyes) six inches deep. Cover with a foot of pine needles. The vines grow through this, while the tubers form among the leaves ("needles" or "straw") and are taken out by hand, as needed, without injury to the plant which keeps on growing and forming new potatoes through nine months of the year.

It is a strange fact that the "straw" or "needles" (leaves) of pine trees have been regarded as not only worthless as manure, but positively injurious to vegetation. What a costly error! I have just been looking over a garden in which the "straw" has been spaded under in immense quantities, and there left to rot. The proprietor tells me that though, 'tis true, roots must not come in contact with undecayed straw, yet, when rotted, it constitutes a valuable manure rich in both potash and phosphoric acid. The appearance of his Strawberries, potatoes and Roses seems to indicate that his estimate of its value is not much out of the way.

Here I find that the identical Doura of which the RURAL NEW-YORKER has of late said so much, has been well tested, and the report more than corroborates your estimate of its value as grown upon your Experiment Grounds. After the Pearl Millet deceit, no doubt your readers will touch new fodder plants with a dainty finger. And it is well they should. I merely desire to convey to them the estimate which those who have tried this particular kind of Doura place upon its value for this part of the country; that is, as I have already intimated, that it is the most valuable fodder plant yet known. It may here be cut three times during the season and "grows all the better for it." Each seed here, as with you, sends up an average of about eight stalks. These, if not cut back, seed freely and the fruit head is precisely the same as represented by your engraving on first page in the issue of last December 27.

[The panicle referred to was drawn while the grain was in the milk. Some of the grain had not even formed.—EDS.]

The "Green Valley Grass" (I believe it was so called), Sorghum halepense, is also being tested here, with some promise that it, too, may prove of value in this land which so stands in need of this class of plants. The roots are quite hardy here and the leaves are now a foot high. The roots, or rather root-stocks, form a complete net-work in the soil of which they will take complete possession in a few years. How long, however, they will yield a paying quantity of leaves is not yet known.

March 15.—We had a glimpse of the sun yesterday. Last night it rained in torrents and to-day is overcast and muggy. The Chinese (purple) Wistaria is making a beautiful display. The following Roses are in bloom or "nearly so:" Gen. Jacqueminot, Bon Silene, Duch. de Brabant, Isabella Sprunt, Lady Warrender, Mad. Ristori, Safrano, Agrippina, Bourbon Queen, Hermosa, Louis Philippe, Souvenir de la Malmaison, Sombreuil, James Sprunt, Lamarque, Marshal Niel, Reve d'Or, Prairie Queen, Amazone, Solfaterre, Archduchesse Isabella, Archduke Charles, Adrienne Christophle, Bougere, Clare Carnot, Clare Sylvain, Cheshunt Hybrid, Count de Chartres, Caroline de Marinesse, Comte Bobrinsky, Duch. de Thuringe, Emp. Eugenie, Isabella Gray, Le Phœnix, Lucullus, Mad. Herman, Pink Daily, Verdiflora (this is the *green* rose), Anna de Diesbach, Cardinal Patrizzi, Triomphe des Beaux Arts. MAJOR.

EUROPEAN CORRESPONDENCE.

RUSSIA, St. Petersburg, Feb. 23.—The Tribune of the 4th inst. notices the fine display of flowers in the rooms of the New York Horticultural Society on the day previous, in spite of the wintry storm outside, which may be something extraordinary for New York, but is nothing unusual here in St. Petersburg. The establishments for floral exhibitions here are very numerous, large and elegant, affording the choicest collections of flowering plants and cut flowers during the entire winter season, say from November until May. The display of Hyacinths, Tulips, Amaryllis, Lilies, and Crocus, is something remarkable, thousands of which are sold daily at from ten to fifty cents each. The chief attraction, however, is the modest Convallaria, with its most delightful fragrance. Here it is cultivated in enormous quantities in pots and boxes, plain and ornamental. Ordinary flower pots, with from ten to fifteen roots and as many flower stalks, are sold at from 50 cents to $1.00; ordinary little willow baskets 8x14 and six inches deep, filled with from forty to sixty roots covered with the graceful Lycopodium on the top, sell at from $2 to $4 each and as I have been informed, the daily sales of the Lily of the Valley (Convallaria), in this way, during the months of January and February, amount to from $2,500 to $3,500.

During January, February and March the Roses attract universal attention, chiefly the Tea and Bourbon. All the newest and latest varieties produced by the French, English and German raisers, can be found in the various floral establishments on exhibition and for sale in bushy and well grown specimens from 18 inches to three feet high, covered with healthy foliage and perfect flowers, ranging at prices from $1 to $3 per plant. The Azaleas make their appearance by the middle of January in large quantities; stocky specimens covered with a mass of flowers of great variety and brilliancy, bring from 50 cents to $3 each, plants from three to five years old. These and Camellias are purchased by the mass and are usually met with in every house during the winter months. Many rare greenhouse and stove plants are exhibited and sold in these establishments, especially Orchids and richly colored foliage plants, such as Marantas Aroideæ, Caladiums, Ficus, Palms and Conifers.

The show of cut flowers and bouquets is magnificent and the demand for them enormous. Rose buds sell at from 20 to 30 cents each; violets at 25 cents the dozen, etc. Bouquets, depending on the selection of the flowers, shape and size and general make-up, cost during January, February and March, from $3 to $100 each, and baskets, made up in the most artistic style, take often out of the pockets of the gallants the nice little sum of $250, to be thrown at the feet of some favored actress, princess or countess. During the operatic and theatrical season not less than half a million dollars are harvested by florists in this way. For balls, parties, decorative and funeral purposes, at least a million dollars are expended during the season.

The establishments exhibiting and selling fruit and vegetables are equally attractive and inviting; here can be seen during the winter months, tastefully arranged, every variety of fruit, such as pine-apples, hot-house grapes, oranges, pomegranates, pears, apples, peaches, cherries, strawberries, plums, etc., in great perfection and large quantities, selling, however, at high prices, on account of their being raised in hot-houses, with the exception of the oranges, pomegranates, pears and apples which are imported from Italy, Spain and France.

In the vegetable line, the variety is great and choice during the entire winter season, nearly all having been raised under glass and in forcing houses. In spite of the severe climate, the thermometer ranging throughout the winter between zero and 30 degrees below that frigid point, and despite the short days and the absence of sunshine, the wealthy can supply their table daily with string beans, cucumbers, radishes, lettuce, in fine, solid heads; spinach, cress, asparagus, tomatoes, potatoes fresh from the gardens, of course at high prices only. The ordinary supply of winter vegetables is also remarkably large and fine, and they sell at reasonable prices and consist of every known variety of cabbage, the finest turnips I ever saw in any country, onions, beets, cellery, both the English and German, carrots, artichokes, fair potatoes, etc.

The floral establishments and fruit stores are great institutions here in St. Petersburg, and surpass those in London, Paris, Vienna or Berlin. W. R. BERGHOLZ.

RURAL SPECIAL REPORTS.

ILLS., Baldwin, Randolph Co., March 13.—We had another snow storm on the 12th inst., followed by a cold night which will almost surely kill the fruit, as the buds were very far advanced and in some cases Peaches and Apricots had blossomed out. We have also had considerable rain, so that the ground is soaked with water, and the weeds are very bad. In low, flat land the wheat is nearly all water-killed while in some places the fly has entirely ruined it, so much so that it will hardly pay to let it stand until harvest. Where the land is well-drained, however, and was well plowed twice and well-prepared before the wheat was sown in the fall, the outlook is very good. So far the prospect for fruit has been good, and unless the present storm and freeze injures the buds, we will have a good crop The outlook now is that we will have a late spring, as it will take several days of warm, dry weather to make the ground suitable for plowing. Farmers are anxious to sow oats. N. J. S.

IOWA, Luni, Wright Co., March 10.—This country is fast becoming a corn and stock raising country. Improvements are going on very fast, and if it continues at the present rate it will soon lose all the romance of a new country, and the sooner the better. O. E. F.

KANSAS, Cedar Vale, Chautauqua Co., March 13.—Snow four inches deep; weather cold. Fruit prospects, bad. Wheat looks fine. Plowing about finished. Forty years' experience with cows has taught me that a cup of the first milk of the cow, after calving, put on the small of the back, just forward of where the hips unite with the back-bone, will remove the after-birth. I have never known it to fail. P. H. L.

MISSOURI, Springfield, Greene Co., March 10.—Our ice crop for this time is very thin—a failure. We have not had winter enough to drive the larks and robins South, or hush the sweet poetry of the cooing doves. Only one effort at a snow-storm during the whole season. On the night of the 12th ult., snow fell rapidly to a depth of six inches, but was melting next day and was soon gone. West of us, in Jasper Co., there was less, and at the Kansas line none at all. March is lovely thus far, sunshine and showers alternately bring forward the wheat and blue-grass. Plows are moving; oats are being sown, peas, beets, onions, potatoes, etc., are "falling in'o line" in the garden; fruit buds are all alive yet—Apricots, Hard-Shelled Almonds and the first Peach buds began to burst nearly a week ago—critical moment. May He who held off from us the Frost King all winter hold him still in spring till our fruit shall be safe! D. S. H.

NEW YORK, Fluvanna, Chautauqua Co., March 9.—Weather mild. Winter wheat looking fine. Hay plenty at $10. Corn, 30c; oats, 38c; beef, 5c. Potatoes are plenty at 40c; prime butter brings readily 27c@28c. Milch cows are a slow sale at from $30 to $40. Many poor grades can be bought at $25 to $30. Grass seeds are ruling high, $3.25 to $3 50 for timothy; clover, $5.50 to $6.00; orchard grass, $2. The ice crop though usually abundant, is very short, not one quarter of the usual supply has been gathered. We have had abundance of snow but little sleighing. There is a great tendency throughout the agricultural districts, especially in those sections more remote from the city, to shiftlessness or want of care of farming implements, fences, etc. Thousands of dollars are annually squandered by neglecting to house tools, vehicles, etc., properly. No farmer can patiently endure a first attempt to plow with the rusty implement which has remained in the furrow where he left it in November last. Nothing can possibly be gained, but much unduly squandered by this slipshod way of trying to obtain a renumerative return for the outlay of money and labor. A tidy farmer is as much to be commended as is a tidy housewife. The old adage that "a woman can throw out with a spoon as much as a man can throw in with a shovel," is all very well to heed, but what would we say if we saw the housewife set her sewing machine, which cost $35, out-of-doors when not in use; while it is a common thing to see the mowing machine, which cost double the amount or more, left for the year where last used, and not a word said. We censure the women too much and the men far too little. Many a farmer squanders more every year in rot and rust on his many implements, wagons and sleighs than would pay his taxes and leave a little to replace old and poor tools by new and improved machines.

Another item is worthy of mention, that of wood. How perfectly absurd to indulge in the luxury of green wood for constant use! Many a man who thinks himself a thrifty, prosperous farmer is willing to endure the annoyance and vexation of a hand-to-mouth custom in procuring wood. Dry wood prepared one year in advance, is better than bank stocks or four-per-cent, bonds. Dry wood and plenty of it, add much to domestic cheer. It is far more enjoyable than apples and cider. There is no labor expended during the short days of winter that pays as large a profit in dollars and cents—to say nothing of peace of mind and the joy and comfort of the housewife—as that preparing dry wood and properly housing it. H. A. W.

PENN., Bald Mount, Lackawana Co., March 15.—Weather warm for this time—scarcely any snow, plenty of rain and mud. Wheat went into winter-quarters in first-rate condition, but owing to the frequent freezing and thawing, it is badly killed. A larger area than usual was sown, but from present prospects the amount in bushels will be less than last year. Wheat now is worth $1.25; rye, 70c.; oats, 45c.; corn, 65c.; horses have advanced in price about 25 per cent., good farm horses are worth about $150; cows $30@45. D. W. R.

The Querist.

ANSWERS TO CORRESPONDENTS.

Stock Queries.

J. S. B., Lost Nation, Ia., asks, 1, how to treat a horse with lumps all over his hind-quarters from the back down to the hock joints; most of them are the size of a hen's egg; the animal seems to suffer whenever they are touched by the curry-comb or otherwise; they are worse in summer than at other seasons and have now lasted three years; 2, what will cure heaves in a horse; 3, what is good for a thick-winded horse; 4, what is ditto for sprains, swellings, sore shoulders, etc.; 5, where can he get the best and most comprehensive works on the horse, the cow, the hog, the sheep and on poultry.

ANS.—To gain the information he desires our knowledge-seeking friend should take a course in some agricultural college and finish off with a couple of terms in a veterinary school. 1. That horse, no doubt, is affected with farcy in a chronic form, and the lumps are "farcy buds." This disease is due to the same poison as glanders, seeking elimination through the skin instead of the mucous membrane lining the nose. It is an incurable disease *fatal* to man and other animals. In the absence of competent veterinary authority, we would advise that some *old, useless* horse should be inoculated with the pus from one of the tumors, and if the effect is carefully observed, it will be found—if our diagnosis is correct—that glanders will be the result, as a horse inoculated with farcy is likely to exhibit glanders, and often *vice versa*. Or, give the animal a laxative diet for a few days and follow with a purging ball—aloes five drachms, calomel half a drachm. After this depletive treatment glanders will be developed. When our diagnosis of the malady is confirmed, as the disease is highly contagious to man and horses, and as there is no known remedy for it in either case, the patient should be destroyed. His life may be prolonged a short time by the use of green food, but the risk of contagion is too great to be incurred by any man who regards his own welfare and that of his neighbors. 2. There is no recognized cure for heaves in horses; but the effect of the disease may be palliated by giving feed of good quality and small bulk namely, plenty of oats, ground corn and wheat bran and 25 pounds of hay per week. We have seen good results announced from the use of prairie hay or grass, and also from that of corn-stalks. 3. Much depends on the seat of the disease—whether in the nostrils or in the larynx or trachea. Locate the disease. 4. Sprains—first cold water, bandages or bathing; second, hot fomentation; third, blisters, and, above all, "rest." Swellings—ascertain the cause—perhaps an abscess—then poultice and when it points, a bold incision with a knife; or if the result of a sprain—see Sprain. Sore Shoulders—collar galls—bathe with tincture of arnica, opium or myrrh equal parts, and give rest until well. 5. Perhaps "The Farmers' Veterinary Adviser"—price $3—by Prof. Law, of Cornell University, Ithica, N. Y., is the best work on the horse, cattle, sheep and hogs, that we can advise, as it is thoroughly good, plain and comprehensive; then the annual reports of the Commissioner of Agriculture at Washington, D. C. Of works treating of special subjects the following are as good as any: For the cow, Armitage's Clatter's Cattle Doctor, price $6; for the hog, Coburn's Swine Husbandry, $1.75; for sheep, Stewart's Shepherd's Manual, $1.50; for poultry, Lewis's Practical Poultry Book, $1.50. All the above can be had through local booksellers, or from the American News Co. of this city.

How to Make Walks for Rural Grounds.

Mrs. J. E. M., Felicity, Ohio, asks for information as to the method and material for making cheap, durable walks for rural grounds.

ANS.—It is not always possible to make a *cheap*, and at the same time *durable*, walk; indeed, it is, not unfrequently, quite impossible. Much, however, depends upon the situation and the available material at hand. If much used, it is very desirable that the walk be dry and pleasant to the feet, and these ends can only be secured in one way. If the soil is light and porous, dig out the walk about six inches deep; if heavy or clayey, it should be

dng nearly or quite a foot. Get together heaps of small stones, broken rocks, etc., and all the *sifted* coal cinders that can be had. Cinders, or scoria, from the blacksmith's or a foundry are excellent, and may be had for the hauling. If it is possible to get plenty of these there will be no need to bother with the stones. If there should be a pottery in Felicity, (and what would Felicity be without one?) the proprietor will be glad to have you remove the heaps of broken material that are always in his way, and you will have secured one of the cheapest as well as best of materials for a good rural walk. With either one or all of the above materials you can make a durable one. The best as well as the *heaviest* walks and drives we ever made were constructed of the refuse of an iron mine—real road *metal*. Anything, in fact, which is hard and angular, will answer the purpose. A good road cannot be made of *round* stones.

Whatever material is used put the largest pieces at the bottom and the smallest on the top. The bottom of the walk should not be flat, but lowest at the sides; in other words, slightly arched. Having put a layer of material on the bottom, roll it down with a garden roller, if you have one, or in some other way make it solid. Then put on another layer a couple of inches thick, and repeat the rolling, and so on till the walk is finished. The top layer, or finish, should be of fine material, and of a color that is pleasing to the eye; above all things, do not use smooth, white pebbles. Some of the natural soil, mixed with a small quantity of sifted coal ashes and a good deal of sand (not coarse gravel), will usually make a good and agreeable surface for a walk of this kind. The surface finish should be about an inch thick, or just sufficient to cover the material beneath. Avoid the too common mistake of making the walk too high. The grass edge or border at the sides should be not less than an inch above the sides of the walk. Finish the surface with a very slight curve, or just enough to carry surface water to the sides. Walks that are rounded up too much, are not only unpleasant and disagreeable to walk upon, but decidedly hurtful, especially to young people and children. Unless the walks are in some parts steep, gutters will not be needed.

As soon as the surface has been laid, water it well with a watering pot having a "rose," and then pass the roller over it till it becomes firm; or it can be rolled partly now, and gone over again after the first rain. This rolling will develop some inequalities and depressions which must be carefully filled, and rolled again. Go over the work in this way, and continue to remedy the defects as they appear, till you can look at it at last with the eye of an artist, and say it is well done; and may all the ladies in Felicity do likewise. A statement of what material can be had and the nature of the soil would make it much more easy to answer such questions.

Sweet Potatoes vs. Corn for Hogs.

J. W. S., Owensboro, Ky., asks the relative value of sweet potatoes and corn for fattening hogs.

ANS.—We have seen but one analysis of sweet potatoes, and that by Dr. A. R. Ledoux, of the N. C. Experiment Station. The sweet potato has slightly less water than the Irish potato and also less albuminoids, but is richer in glucose or sugar. We give a table of the digestible constituents of the sweet potato, Irish potato, Indian corn and cotton-seed cake.

	Digestible Nutriments			Nutritive Ratio.	Comparative Value.
	Albuminoids.	Carbohydrates.	Fat.		
Sweet potato	1.5	23.5	0.5	18.6	0.28
Irish potato	2.1	21.1	0.2	10.6	0.29
Indian corn	7.3	38.4	3.6	10.2	1.04
Cotton-seed cake (decorticated)	31.0	33.3	13.3	1.6	2.05

This table gives a full understanding of the comparative value of both kinds of potatoes as compared with corn and cotton-seed cake. We give cotton-seed cake, because it appears that the sweet potato is deficient in albuminoids or muscle-forming matter, and cotton-seed is very rich in this element. And as the sweet potato and cotton-seed grow together, a little of the latter should be fed with the former to make a well-balanced food. The sweet potato has only one of albuminoids to 18 6-10 of carbohydrates or fat-forming food, whilst the Irish potato has one to 10 6-10, and corn about the same. Lean shotes of 100 or more pounds' weight may be fattened properly upon sweet potatoes, because they only need fat laid on to fit them for slaughter; but they have not muscle-forming matter enough to grow pigs properly; yet, if a small proportion of cotton-seed cake is given with sweet potatoes, the food is excellent for growing or fattening pigs. Four pounds of boiled cotton-seed or two pounds of decorticated cake, fed with one bushel of sweet potatoes, will make a well-balanced ration for hogs. It will be seen that 400 pounds of sweet potatoes are only about equal to 100 pounds of corn. But the sugar of sweet potatoes is a little more fattening than the same weight of starch in corn. Neither the potato nor corn is quite appropriate to grow young pigs without some more nitrogenous food mixed with it. The Cow-pea, at the South, is excellent to feed with the sweet potato, as it contains just what the potato lacks. Feeders should study how to mix foods of various qualities together, and not try to find a single food for general feeding, for no one food contains all the qualities to satisfy the wants of the animal.

Grafting Evergreens.

A Subscriber, Nashville, Ohio, asks how to graft evergreens.

ANS.—To graft evergreens under any circumstances is not easy. Out-of-doors it is especially hard on account of sudden changes of weather, etc. A covering of oil paper will help to protect the graft. In a small greenhouse or under a sash the operation is easier, although fraught with considerable difficulty even then. The difficulty does not lie so much in the mere operation of cutting and inserting the cion into the graft, as in the selection of proper stock and general care of the grafted plant until it has passed a certain critical period. The temperature must be kept warm and very even. A sash within a green-house is therefore often used.

In regard to selecting a suitable stock for the different varieties of evergreens, the following rule may be considered established. Use only such stocks as are closely allied by nature to the cion. In most cases, the stock should belong to the same sort. For instance, for such evergreens as the varieties of Norway Spruce, Hemlock, Arbor-vitæ, Juniper (Red Cedar), etc., the same Norway Spruce, Hemlock, etc., must be used as stocks. The two-leaved, three-leaved Pines and five-leaved Pines—whether White, Scotch or Mughus—must be used as stocks for varieties belonging to their respective divisions. There are, doubtless, seeming exceptions to this rule, as when we find the Retinosporas of Japan grafting readily and permanently on our Arbor-vitæs, but the Retinosporas would, we feel confident, be called Arbor-vitæs if they were American-born instead of Asiatic origin. In short, it would seem that the value of these affinities between plants in the relation of stock and cion is not sufficiently recognized in our botanical classification.

W. H., Adamsville—one of 14 in 14 States—asks, 1, are any fertilizing qualities lost by burning; 2, the best early tomato; 3, the best sweet corn; 4, the best incubator; 5, what degree of temperature is best adapted to the preservation of fruit; 6, will hens do well confined to a yard; 7, will cabbage thrive in wet land; 8, will Paris-green injure potato vines?

ANS.—1. Yes, nitrogen is lost by burning as well as phosphorus and sulphur in minute quantities; phosphorus, chlorine, sulphur, potassium, sodium, lime, magnesium, etc., are left as ash constituents. 2. There is no "best" early tomato. What is earliest with us may not be earliest with you. We have found the "Little Gem" the earliest. But it is a poor thing. Conqueror is considered an early tomato. Hathaway's Excelsior is early and good. Hubbard's Curled-leaf is also early and good. The leaves curl up as if the plant were suffering for water. 3. Triumph is early and excellent. Early Minnesota is esteemed by many market gardeners as at the present time the earliest and best—that is of very early varities. 4. Halstead's is as good as any we know of. 5. Just above freezing. 6. Yes, if given all the kinds of food they need; if the houses and runs be kept scrupulously clean; if not more than ten are confined in an area of 400 square feet. 7. No. Land, to grow fine cabbages must be well-drained. Much depends upon the season, but, as a rule, fine crops can be produced on any land whether muck, clay, sand, if well prepared and manured. But it must not be *wet*. 8. Yes; if used too strong. One pound of pure Green to 40 of flour or plaster—is about the right strength, though it has proved quite effectual when diluted very much more.

B. G. J., Decatur, Ill., wants to know how to prevent a hedge from sending up sprouts several feet from the original hedge-row.

ANS.—The best preventive is, not to use plants for hedges that have a tendency to "run," or send up sprouts from the roots. In this case the trouble may be overcome by digging a trench two feet from the row and two feet deep, to cut off the roots that run into the field. The trench need not be left open.

G. C., North Lindale, Ohio, asks, 1, how to destroy the potato "bug." 2, whether London Purple is as efficacious as Paris-green for that purpose.

ANS.—1. Paris-green and hand-picking have hitherto been found the best exterminators. 2. London Purple is said to be as efficacious as Paris-green. It has not been tried so extensively, however, but probably next season will decide the merits of this new bug destroyer.

T. H. B., Niles, O., asks the name of a dealer in second-hand books here.

ANS.—Andrew R. Leggat, 3 Beekman Street, is probably the most extensive dealer in such wares in the city.

The Literary Revolution.

Volunteers.

Our Friends know how, like "leaven," our books work when they get into a neighborhood. It is common for the sight of one to sell a hundred. In one case a sample of "Universal Knowledge" actually sold 4,000 volumes within a week. It got into a large manufacturing house, and "took" more rapidly than "smallpox" ever did! Our customers invariably become our friends and volunteer to work for the Revolution.

Our Catalogue, handed to an acquaintance by one who knows our books or knows us, with one good word of commendation, will be of real and probably of great service to the "revolution." Will not every friend who receives an extra catalogue make such use of it? We will gladly send any quantity for wise distribution.

Remarkable Progress. The success of this movement continues to be without parallel in literary history. But little more than a year ago one large printing press was sufficient for its needs. To-day our facilities, equalled in extent by only a few of the old millionaire publishing houses, are taxed to the uttermost, but cannot meet the demands for our books. For weeks we have been running our presses twelve hours a day, recently extending the time to fourteen hours; as one set of hands cannot long endure such continued labor, we have already started two sets of hands, and the machinery, which never tires, will run the entire twenty-four hours six days in the week.

Type-Setting by Steam. It has not been commonly known that type is now set and distributed by machinery. It is a very interesting sight to see the machines at work which have set the type in our "Acme Libraries" of "History," "Biography," "Classics," and *The Library Magazine*. With their aid one man does the work of five by the old hand process. One office at work for us has twenty-six of these machines already, and more are building. Probably no invention ever more severely taxed the ingenuity of man, and none was ever more completely successful.

Three Great Books } To Readers of this Paper.
Three Great Offers }

The old millionaire publishing houses, whose monopolies and power we are breaking, of course fight us as best they can. Many newspapers under their power and influence have refused us the use even of their advertising columns, and have propagated slanderous reports. The many thousand booksellers and agents of the country have commonly made the mistake of opposing their own, as it is the people's, interest, and we have sold books in spite of them, instead of by their aid. The best men of this class, however, are learning and accepting the fact that the "revolution" is in their interest also, as it vastly increases the sale of books, and our "Terms to Clubs" afford abundant profit to the bookseller who has $100 and a proportionate amount of brains to invest. The greatest enemy which the revolution has thus far met has been "incredulity." Some clergymen have thought we meant a "practical joke" by offering Geikie's "Life and Words of Christ" complete for fifty cents. Good people commonly have thought books could not be made so cheap. It is a simple fact that thus far it has cost us about as much to advertise our books and convince people that we are really telling the truth about them, as it has cost to manufacture the books themselves. If it were not for this immense tax for advertising, it would be possible for us to make prices even less than we have done. With the special object of demonstrating to *the readers of this paper* the great things which are being done for lovers of good books, and making further advertising unnecessary, we describe below *three great books*, one or more of which is sure to be wanted by every intelligent owner of 50 cents. They fairly represent our large and rapidly-growing list of Standard Books, in quality of paper, printing, binding, and illustrations.

First Offer. Either of the three books will be sent by mail on receipt of price and postage, and if not found satisfactory may be returned, at once, and the price will be immediately refunded.

Second Offer. To any reader of this paper who will cut out and return this slip within one week from the time he receives it, with the sum of $1 50, we will send the three books by mail free of postage, and either or all may be returned at once if not satisfactory, and the price will be refunded.

Third Offer. Any reader of this paper who will take the trouble to show this advertisement to his neighbors, and influence them to unite with him and order, within one week from the time he receives the paper, of the three books, to the value of $5 00, we will send the books free of postage or expressage, and send to him one book extra, for his trouble. Any or all of the books may be returned if not satisfactory, and the money will be refunded. This slip must be cut out and returned with the order, to secure these terms.

The Editors and Publishers of this paper know well both us and our books, that they are all we represent them, and that we do all we agree to do. If you inquire of your neighbors you will probably find some who have already dealt with us, for our customers are now found in almost every village in the United States and Canada.

Life and Words of Christ.

By CUNNINGHAM GEIKIE, D. D. Price reduced from $3 to 50 cts.: beautiful brevier type, neat strong cloth binding; postage, 8 cts.

"Profoundly interesting—marvellously cheap."—Albany Evening Times.
"It is fascinating reading."—Boston Commonwealth.
"The best of all the lives of Christ—a marvel of cheapness."—Portland Christian Mirror.
"A great and noble work, rich in information, elegant and scholarly in style, earnestly devout in feeling."—London Literary World.
"It is a work of profound learning.' —Archbishop of York.
"Simply indispensable to students of gospel history."—British Quarterly Review.
"A work of gigantic industry, of the highest literary rank, and breathing the spirit of true faith in Christ."—Dr. Delitzsch, the Commentator.
"It seems to me among books a pearl of great price, and a man might well sell a thousand others to become possessor of this one."—Harriet Beecher Stowe.
"Will last when we have all passed away—is by far the best."—Rev. C. H. Spurgeon.
"The most interesting book we have ever read on the subject."—Churchman, New York.
"The best book that has ever appeared on the subject."—The Homilist.
"A more thorough, careful and exhaustive work we have never read."—Baptist Magazine.
"Dr. Geikie's book is admirable."—Harper's Magazine.
"A neat volume, good enough type, handsomely bound."—Christian Standard and Home Journal.
"It is amazingly cheap and far the best life of our Lord."—Zion's Herald, Boston.

Acme Library of Biography.

Twelve standard books, at one time published at $1 25 each, now issued in one volume, beautiful brevier type, nearly cloth-bound, for 50 cts., postage 8c., containing: "Frederick the Great," by Macaulay; "Robert Burns," by Carlyle; "Mahomet," by Gibbon; "Martin Luther," by Chevalier Bunsen; "Mary, Queen of Scots," by Lamartine; "Joan of Arc," by Michelet; "Hannibal," by Thomas Arnold; "Cæsar," by Liddell; "Cromwell," by Lamartine; "William Pitt," by Macaulay; "Columbus," by Lamartine; "Viltoria Colonna," by Trollope.

The Book of Fables.

Æsop's Fables, complete, with text based upon Croxall, La Fontaine, and L'Estrange, with copious additions from other modern authors, profusely illustrated by Ernest Griset. About 400 pp., cloth: price 50 cents: postage 8 cents. Ready March 10.

Our new edition of the Fables of Æsop we think will be found, for reading or reference, the best ever issued. It contains about twice as many of the fables attributed to Æsop as the edition we have hitherto published, with nearly as many more of later date. The type is a large long primer of a beautiful face, and the illustrations, nearly forty in number, are by the best artist who has ever pictured the wit and wisdom of the antique satirist.

VERDICT OF PRESS AND PEOPLE:

One of Many. It hardly seems possible, and yet this book is one of many, which are published by this house at low prices. It is a marvel in bookmaking. *Telegraph*, Pittsburgh, Pa.

A Country Parson's Opinion. I bid you God-speed in the worthy enterprise of giving us good literature and cheap. We country parsons can now fill our shelves with good books at small cost. *Rev. C. H. A. Bulkley*, Port Henry, N. Y.

The Important Problem. The American Book Exchange is solving the important problem of furnishing good and standard books at prices within the reach of all persons of moderate incomes. *Chicago Evening Journal.*

A Rich Relative? Has some rich relative left you a colossal fortune which you are spending in publishing books for the people at nominal prices? If so, I admire your taste. But wont the old-line publishers be glad when it is gone? *B. F. Bingham*, Randolph, N. Y.

Reliable—Too Strange to be True! The American Book Exchange is reliable. This we say from actual knowledge. It is almost too strange to believe that standard books should be published at so low a price, but it is an actual fact, and the books are well printed and bound. We unhesitatingly endorse the American Book Exchange, and commend its course in bringing the best literature within the reach of all classes of people. *The Central Baptist*, St. Louis, Mo.

Can't Lend Ours! To our friends of literary tastes we would say: Your lives will be intolerable without this work. Send and get it: we can't lend ours. *State Journal*, Jefferson City, Mo.

Editor of the Tribune. *Dear Sir.*—I desire with shame and confusion of face to take it all back, *i. e.*, what I wrote in my first communication. Since mailing I have received from the American Book Exchange the volume for which I sent. I now regard Mr. Alden as a benefactor, and shall endeavor to disseminate the knowledge of him and his wares among my acquaintances. Penitentially yours, *C. H. Bordman*, St. Paul, Minn.

"Wring your Neck." You are making a first-class name for yourself and house in this city outside of the general book men. They would, if they could, wring your neck if they dare. *J. H. Beatley*, Chicago, Ill.

Chambers' English Literature. So popular and descriptive in character as to interest the most unscholarly reader, it is so comprehensive and reliable as to command the respect of the most accomplished student of our literature. Has the merit of compactness, portability, and inexpensiveness. Of course to meet these ends the type cannot be of the largest nor the paper of the thickest: but what deficiencies exist in these respects—and they are not material—are more than made up by the amazing cheapness of the work. The American Book Exchange deserves credit for the part it is taking in popularizing standard literature. *Christian Union*, N. Y.

OTHER STANDARD BOOKS.

Library of Universal Knowledge, 20 vols., $10 00.
Milman's Gibbon's Rome, 5 vols., $2 50.
Macaulay's History of England, 3 vols., $1 50.
Chambers' Cyclopædia of English Literature, 4 vol., $2.
Knight's Popular History of England, 4 vols., $3 00.
Plutarch's Lives of Illustrious Men, 3 vols, $1 50.
Milton's Complete Poetical Works, 50 cents.
Shakespeare's Complete Works, 75 cents.
Works of Dante, translated by Cary, 50 cents.
Works of Virgil, translated by Dryden, 40 cents.
The Koran of Mohammed, translated by Sale, 35 cents.
Adventures of Don Quixote, illustrated, 50 cents.
Arabian Nights, illustrated, 50 cents.
Bunyan's Pilgrim's Progress, illustrated, 50 cents.
Robinson Crusoe, illustrated, 50 cents.
Baron Munchausen and Gulliver's Travels, illustrated, 50 cents
Stories and Ballads for Young Folks, by E. T. Alden, illustrated, $1.
Acme Library of Modern Classics, 50 cents.
American Patriotism, 50 cents.
Taine's History of English Literature, 75 cents
Cecil's Books of Natural History, $1.
Pictorial Handy Lexicon, 35 cents
Sayings Wise and Otherwise, by author of Sparrow-grass Papers, 50 cents.
Mrs. Hemans' Poetical Works, 75 cents.
Kitto's Cyclopædia of Biblical Literature, 2 vols. $2.
Cruden's Concordance, unabridged, $1.
Rollin's Ancient History, $2 25.
Smith's Dictionary of the Bible, illustrated, $1.
Works of Flavius Josephus, $2.
Comic History of the United States, Hopkins, illustrated, 50 cents.
Health by Exercise, Dr. Geo. H. Taylor, 50 cents.
Health for Women, Dr. Geo. H. Taylor, 50 cents.
The Library Magazine, 10 cents a number, $1 a year.
The Library Magazine, bound volumes, 60 cents.
Leaves from the Diary of an Old Lawyer, $1.

Each of the above bound in cloth. If by mail, postage extra. Most of the books are also published in fine editions and fine bindings, at higher prices.

Complete Descriptive Catalogues and Terms to Clubs, will be sent free on request.

Remit by bank draft, money order, registered letter, or by express. Fractions of one dollar may be sent in postage stamps. Address

AMERICAN BOOK EXCHANGE,

P. O. Box 4510.
JOHN B. ALDEN, *Manager.*

Tribune Building, New York.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address THE RURAL NEW-YORKER,
78 Duane Street, New York.

SATURDAY, MARCH. 27, 1880.

REMOVAL.

On and after May 1st of this year the Rural New-Yorker will occupy its new quarters, No. 34 Park Row, corner of Beekman Street.

Blacking the outside of horses' hoofs to make them shine and show well, is an injurious practice, for if done, as is usual, with a mixture of grease and lampblack, as soon as the horse is brought out on the road, dust begins to adhere to the hoofs, which are naturally porous, and thus stops the circulation of air in them, causing disease. The best treatment of the hoof is to keep it clean, and leave it to show its own natural color.

The nineteenth volume of the American Short-horn Herd Book it is expected will be ready for delivery in April. We are informed that this brings the register of thoroughbred bulls up to 37,500, and the cows to about 45,000, making altogether 82,500 head put on record since this work was commenced in 1846. Probably 15,000 or more of well-bred Short-horns, including those in Canada as well as in the United States, have been neglected to be put on record, thus materially lessening their value when offered for sale to those who care for a satisfactory pedigree with their animals. We have no doubt but 10,000,000 good Short-horn cattle have been imported into and bred in America since 1815, the most part of them during the past 45 years.

A New Oil Plant.—Recent English journals speak of a new oil plant (Lallementia liberica), from Persia, as having been acclimatized on the fields of the agricultural school at Cherson in southern Russia. It belongs to the Labiatæ family, and is very similar to Dracocephalum (Dragon's-head). The herb attains a hight of one and a half to two and a half feet, and bears some 2,500 seed grains, which give an extremely pure oil, applicable even for culinary purposes. Cherson is situated about 90 miles north of Odessa, in a temperate region where beech trees grow but not Chestnuts. The natural productions are grain, hemp and tobacco. It lies a little to the north of the line which marks the limit of profitable wine-growing.

Land and Home, a farm journal, whose genesis we announced but a few months ago, has failed. The reason assigned is "lack of capital." Land and Home from the outset secured some of the best writers of the country. It was conducted with surprising vigor. It was receiving many compliments and encouraging words from men who do not compliment idly. Prominent advertisers, even, were expressing their satisfaction with the "returns" from their announcements in Land and Home. Everything seemed to prosper. There was not the least sign of weakness. Land and Home deserved the hearty support of the agricultural community. And yet lack of appreciation, as well as "lack of money," must have had something to do with its early death. Well, Mr. Libby, its editor and proprietor, made a bold, brave push. He is young enough to push again, and we wish him better success in his next enterprise.

A Dutch Picture.—The English geographer, Clements Markham, in calling attention to one of the surprising changes which have occurred on the coast of Holland, draws a picture which is equally interesting from the agricultural and from the geographical points of view. The student of history reads of the great sea fight which King Edward III. fought with the French off Sluys in 1340; how, in those days, the merchant vessels came up to the walls of that flourishing seaport by every tide; and how, a century later, a Portugese fleet conveyed Isabella from Lisbon, and an English fleet brought Margaret of York from the Thames, to marry successive Dukes of Burgundy at the port of Sluys. In our time, if a modern traveler drives twelve miles out of Bruges across the Dutch frontier, he will find a small agricultural town surrounded by corn fields and meadows, and clumps of trees, whence the sea is not in sight from the top of the town-hall steeple. This is Sluys.

We are receiving many, many thanks from our subscribers for the seeds and plants of our present Distribution. All seemed pleased and we have had no complaints thus far, except that several have received two packages. We can assure our friends that we are as much pleased as they can be and really feel like thanking them for their hearty appreciation. Of what value soever our past plant and seed distributions may have been to the country, we feel justified in saying that our next Distribution (to be announced Sep't. 1st) will throw our previous efforts quite into the shade. Three kinds are already secured (unless crops should fail), and one of these three, from careful trials made during the past two years, bids fair to prove more valuable than any plant of its class as yet known to our farmers or gardeners. Meantime we hope our friends will carefully test the plants and seeds which we are now mailing them and that in due time they will tell us of gratifying results.

One of the most remarkable statements which we have seen respecting the potato is the following, which we clip from a late number of a respected contemporary:

"It is said by those who claim to know that the eyes near the base are the male, and those on the upper part the female, the number on each being in right proportion. If this be so, it is clear that every eye should be planted."

The eyes of a potato male and female! The same writer (Mr. C. E. Hewes) says: "Any farmer can tell how corn gets mixed—the process of mixing potatoes (tubers) is the same"(!) Again he says, "No one doubts that melons, cucumbers, squashes and pumpkins mix—the pollen being carried by the wind, &c."

The kernel of corn is the seed—the ovary in fact—and the effects of crossing are evident at or before maturity. Melons do mix, but only through the seed. Hence, the effects of crossing are never evident except in the fruit from the mixed seed. Mr. Howes takes for granted that any intercrossing between the flowers of different potatoes affects the tubers, and that in this way "hybrids" may and do occur. And yet this same writer regards the publication of "single experiments not only as impositions but outrages!"

The weather prophets are out strongly in favor of a late spring, and it is not improbable that at least in some parts of the country their predictions will prove true. All reports concur in showing that, light as has been the snowfall east of the Missouri Valley, the Rocky Mountains and adjacent plateaus are loaded with the heaviest snowfalls and ice masses that have burthened them for many years. The melting of these will send their cold water eastward, while the westerly winds that at this season usually sweep over the region will come east chilled by the cold they have been charged with on their passage, making a late and probably moist spring as far east as Minnesota and Iowa. On reaching the Mississippi Valley, however, these winds are likely to encounter the warm, moist breezes from the Gulf, and the consequent condensation is not unlikely to produce a mild, wet spring in the States along the upper Mississippi and Ohio Rivers. "Old Probabilities," however, has a habit of falsifying the boldest prognostications of our ordinary weather prophets, and it may be that he will show no more respect for the modest forecast of the Rural.

The telegraphic advices during the week from various parts of the Union show that an unusually heavy rain fall has occurred almost all over the interior of the country, being especially severe in the Ohio, Cumberland and Tennesee valleys. The fall of 1.67 inch of rain at Nashville, in eight hours, on Tuesday, is but a sample of the torrental downpour that has drenched vast areas. The prevailing winds nearly so far north as the lakes, have of late been from the south. These warm, water-charged currents from the Gulf, meeting the cold northwestern blasts of March, have been depositing their condensed stores superabundantly. The immediate effect of this downpour upon farming is generally hurtful. Flat, undrained lands are bogged; hillsides are leached or washed away; streams and rivers, here and there, flood the adjacent country to the injury or often loss of stock, fences and other movable property. Ultimately, however, the drenchings will doubtless prove to the farmer a blessing in disguise. The rainfall of winter and early spring is the basis of all forecasts of the subsequent harvest and this abundant water supply, filling all subterranean resevoirs, is a cheering indication of good crops, especially in the grain-growing regions, unless the young wheat has been already severely injured by other causes.

"FESTINA LENTE."

The ancient Romans had that queer old paradoxial proverb or apothegm, "Festina lente," "Make haste slowly." It is a good one, and its observance would save many a blunder. We have similar proverbs in our own language, as, for example, "Always in haste, but never in a hurry." This means, we take it, always prompt and active, but never flurried." Another of our similar expressions is "Think twice before you speak once," and another, "Haste makes waste," and still another, "Things done in haste are repented at leisure." These proverbs are on the whole eminently wise.

Take a few illustrations. An agent wants to sell you a device for taking up the "slack motion" in your mowing-machine pitman or gearing. Don't be in a hurry. If the patent is good for anything the men who make the mower will introduce it. Let some one else try it. Don't pay five dollars unless you are sure the device is all the glib-tongued agent represents it to be, and of this you cannot be sure without trying it—and finding yourself fooled.

The "head salesman" of some great seed store (he says) will give you a chance to be the sole proprietor for your township of the "Norway barley" or the "Scandinavian oats" or the "Bohemian rye." It sells at ten dollars a bushel, and the firm can't supply orders, and will only sell you one bushel on condition you will sign a written contract not to sell at less than that price, and to sell all your surplus, if any, after supplying your township, to this "firm" at seven dollars per bushel, etc., etc. "Festina lente." Our "head clerk" is too anxious to enrich you. His "firm" is too kind by half.

Or a stylish lightning-rod wagon with two "operators" stops at your house. They were directed to you as the most influential farmer in town (look out!) and are willing to put up rods on your very fine mansion and stables (look out!) at just one-third of their usual rates (look out!) for your influence (don't sell it). They are not permitted by their "firm" to take cash (look out!), but only notes payable one year from date (look out!!) and on your approval then of the rods. Now, then, look out! "Festina lente." *Don't sign* any note, or agreement, or inventory, or list, or paper of any kind for any stranger. It will turn up in a year or so in the hands of some other and innocent party quite a different thing from the one you thought you signed, or for a far larger amount, and you will have to pay it. On the other hand, don't *buy* any note from a stranger, even if signed by a man whose signature and solvency you know, without first seeing the signer of the note. Indeed, so common has this particular swindle become that some of our legislatures already have bills before them, or laws already passed, requiring one day's notice to the drawer of a note before its purchase by any second party.

In all such matters, "Festina lente." Don't be in a hurry to make money out of any one who is *anxious to have you* do it. Don't try to get two or ten dollars by paying one. As a rule money must be *earned*, not suddenly made out of some one else. Whenever any one, under any pretext, wants to give you an extra good bargain out of himself, don't let him do it. Don't bet on cards the other man handles. You will find to your cost that "the motion of the hand deceives the eye." Don't buy a $20 bill with a box of soap for a dollar, though you see with your own eyes that the soap-man inclosed it. You will find it was "not that box but another box." You will find that you are swindled out of a dollar instead of *swindling him* out of $19; for that was what you had hoped to do. You put yourself on his level as a swindler, and found him smarter than you. It is his business to be. You tried to overreach and were yourself overreached. You tried to get value without giving a fair equivalent, and found you *gave* value without getting an equivalent. And the verdict on victims of confidence games always is, "Served them right." For these confidence games would make little headway if there were no *dishonest* victims. Sometimes the victims are simply green, but usually it is avarice that leads them into the trap. Don't let it lead you. Don't even change a ten dollar bill for the gentlemanly strangers who feed their fine but tired team in your stable because they can't reach the next hotel, and insist on paying you for their dinner and horse feed. Better give the dinners outright than the nine dollars change *and* the dinners, too. Their ten dollar bills don't pass at bank, and these men never have any change about them. Don't take charge of any "found" pocket-book or valise, and try to find the owner. Don't touch any project by which you are perfectly sure you can (dishonestly) make a "nice thing" out of some one else. You will find the "nice thing" will be made out of you. And it ought to be. "They that *will be* rich fall into a snare." "Festina lente."

BREVITIES.

Many Mulberry trees are being propagated in the South, and there is much talk about the production of silk.

Those who have a desire to know how beautiful a tree the despised Osage Orange may become, when properly treated, should visit the grounds of Storrs, Harrison & Co., Painesville, Ohio.

Corn in the hill or drill—which? One plant every foot ought to do better than three or four plants struggling together in a hill. In the former method it is at least twice as much trouble to keep weeds from each plant as in the other. Is the difference in yield enough to pay for the difference in labor?

There is a new bug (Cicadula exitiosa) that promises to prove a great pest to our grain fields. Already in South Carolina it has perpetrated considerable damage. It is of a yellowish color, one-fifth of an inch long. The abdomen is black above and the wings are described as of a "milky white." No remedy is as yet suggested for its check or extermination. It is partial to wheat and oats.

Dr. Albert R. Ledoux, Director of the N. C. Experiment Station, has just resigned his position, and proposes to open in this city a laboratory devoted to all branches of analytical work, but more especially in the line of agricultural chemistry. We heartily wish the Doctor success in his new venture. Dr. Goessman, of Amherst, will probably succeed him as Director of the N. C. Experiment Station.

We find in some of our agricultural papers advertisements of both Queen of the Market" and Cuthbert Raspberries. Nothing is said in the editorial columns of those papers that they are the same, and their readers are left to purchase the same as if they were different varieties. Judge Parry, we must believe, is not *postive* as to their identity, else he would not advertise the Cuthbert under another name.

Black Suffolk Pigs. Here is a new English wrinkle. White Suffolk were formerly plentiful enough there, and many were imported years ago into the United States. We should like to know whether the Black Suffolk are not the same as Essex, for English breeders are in the habit of giving the county name to all pigs and sheep bred there, no matter if they thus characterize the same sort under a dozen different names

The third corn premium consisted of a Giant Feed Mill valued at $45 and contributed by J. A. Field, Son & Co., St. Louis, Mo. It was won by A. B. Dille of Edgarton, Kans., who sends the following acknowledgment:

Editors Rural New-Yorker:—The Big Giant Corn mill came safely to hand, and for it please accept my sincere thanks. I should have written sooner, but was on the eve of starting on a two weeks' trip. Very truly yours, A. B. Dille.
Edgarton, Kans.

The Rural New-Yorker has advocated cutting back evergreens, according to the injury the roots sustain in transplanting the same, as deciduous trees are cut back, though not to the same extent. A case has recently come to our notice in which two Red Cedars (Juniperus Virginiana) of goodly size were transplanted. One was cut back; that is, the top was so cut off so as to leave barely half the tree. The other was not cut back. The latter died the same season. The other is now a shapely, vigorous tree.

Mr. Horace T Beebe, of Ravenna, O., writes as follows: "I notice on the first page a cut of what purports to be the "Gregg" Raspberry. I regard the cut as almost a burlesque—the fruit of the Gregg is twice as large as represented. I inclose a cut of a bunch and will say that we raised last season berries as large as represented. I had a patch, my son and several others had other patches, and they were fully up to the cut inclosed." Many of our readers have objected to our original illustrations of small fruits for the same reason. The sketch inclosed by Mr. Beebe exaggerates its average size, we think, as much as ours diminished it. As a rule, the illustrations in small-fruit catalogues serve only to disappoint the purchasers.

A Hunting Horse Stud Book is now proposed in England, which will take the same rank there as the Trotting Horse Stud Book does in America. Race horses are too slight, and cannot carry the heavy weights of fox hunters, and leap high fences as those which are called three parts bred. But the latter being chiefly got by racers out of large, cold-blooded mares, often lack speed, wind and endurance enough to carry them to the end of the hunt. It is proposed to take the best of these, as we do our best trotters, and couple them together to form an exclusively hunting breed. Horses thus bred, when not found equal to a fox chase, are superior for the carriage and can be sold at high prices generally for that. But if they happen to be too coarse for this and the road, they can be used on the farm. Then there is no loss attending such breeding, as in race horses, for if one of the latter does not prove swift on the course, he is worth little for any other purpose.

For Women.

CONDUCTED BY MISS RAY CLARK.

MY MOTHER DIED TO-DAY.

JOSEPH A. FARRELL.

You ask what ails this heart of mine,
That I'm not gay and bright;
You ask me why I cannot sing
A little song to-night.
I'll tell you, friends, the reason why:
My soul's not light and gay,
Because a thing of bitter grief
Has taken place to-day.

You ask what ails this heart of mine.
That I'm so sad and drear;
You ask me why adown my cheek
There steals a sparkling tear.
I'll tell you, friends, I cannot drive
This mournfulness away,
Because a thing of bitter grief
Has taken place to-day.

You ask what ails this heart of mine,
That I gaze up on high
And sadly watch each gorgeous thing
In yonder starry sky.
I'll tell you friends, why I look up
At Heaven, so far away—
I seek to find an angel form
That left our home to-day.

You ask what ails this heart of mine,
That I, for pleasure born,
Should be to-night so very changed,
So wretched and forlorn.
You beg me sing for you a song,
And drive dull care away;
Excuse me, friends, I *cannot* sing—
My mother died to-day!

A CHAPTER ON CLEANING FLOORS.

A CLEAN kitchen floor, is a very nice thing in a family, and every house keeper aspires to a tidy floor, as a criterion of her skill. But some of the good ladies make a sad mistake in their praiseworthy efforts, and make work for themselves, as well as injure their floors, and keep them looking gray and dirty.

One day, I saw a young housewife, take her dish of soft soap, and spread it over her floor, which had been newly painted only a few weeks before; then down she went, on her knees, and commenced scrubbing with a brush and hand mop. Oh, how she did work! and how tired she looked! and how her back ached! I watched her till I could stand it no longer.

I said: "Don't you like your painted floor, the reason you are scrubbing the paint all off?"

"I want to keep it bright and clean; paint wears off too quick, it hardly pays to get it painted, any way."

"I should think not, at the rate you take it off. You just spoil your paint, and floor too."

"Why so; I don't understand what you mean?"

"Now, look here, there is nothing that will take off paint like soap, where your soap lies, your paint will all be off before a week. You should never use paint in that way. I supposed you were trying to get it off; there is no quicker way to do it."

"Well, I wish I had known it before; my husband says he never saw such poor paint."

"I expect the paint is good enough, it is the way you manage it. Now this room was all grained and varnished very nicely just before you came here, you could see your face in the doors, they were so bright. You ought to have kept it so for half a dozen years. Now see how it looks, half of the paint is rubbed off and not a bit of shine to be seen."

"Oh, grandmother! do you think I did it on purpose?"

"Bless you, child, no! You knew no better, so I thought I would tell you; you are ruining the looks of your neat kitchen, and also killing yourself all for nothing!"

She looked so sober, I was real sorry for her, and told her to take a long-handled mop, and wash her soap all off, and then I would show her how to mop her floor.

So I tucked up my dress and rinsed all the suds out of the pail and mop, and took some clear, hot water, and washed up the other half of the floor and then took some more clear water, and wiped it up dry. Well she had to own that the half I washed was ever so much cleaner than her part.

Afterward we sat down and talked about it; she was a real nice, little woman and did just as well, as she knew how, and spared neither strength or time to keep things neat and tidy. I expect there are plenty more young women, who waste their health, strength, soap and time, just as foolishly as she did.

If you have a painted floor, keep soap and soapsuds off of it for it spoils the brightness of the paint, makes it soft and then it peels off, leaving the floor looking worse, than if it had not been painted.

If your floor has not been painted, keep soap off of it, for it gives it a dirty, grimy look, and keeps growing worse all the time. Just take clean, hot water, put in a teaspoonful of spirits of ammonia into a three gallon pail of water, stir it, and with a clean, long-handled mop, rub the floor all over, then wipe it off with clean water. It will take a little while to get the gray out of the boards, but it will come out after a time, and you will find it far easier to keep your floor white and nice, than it was when cleaned with soap or suds.

Another thing, when you get your floor all washed, if you would ring your mop out of the clean water, and go around the room and wipe the drips all off the base boards, and take a part of the mop, and wipe out the crevices, you would save a great deal of hard work, and back-ache too.

"Oh, grandmother! I am so glad you have told me how to do it easier and better; I do want to be a nice housekeeper, and be economical, but it seems so hard, when one does not know how to do it; and, I get cross sometimes, about the dirt tracks that mark it all over. It is discouraging to have a floor all tracked up before it has time to dry. Don't you think so?"

"Yes, I know all about it; but it is nothing to what it would be, if the boots were hung away in the closet, and the feet that use them were laid under the green grass. There, don't feel bad; there are worse troubles than to have your clean floors tracked up, and fretting, never did any good to any one." GRANDMOTHER.

TERMS AND MATERIALS USED IN NEEDLE-WORK.

TABARET.—A stout satin-striped silk used for furniture.

TABBINET.—A name for poplin of rich character, the warp of silk, weft of wool. So called because the surface is "tabbied" or watered. Sometimes a pattern is introduced into it. It is chiefly used for window curtains and other upholstery purposes.

TABBY.—A coarse kind of taffeta, thick, glossy, and watered. In silk this kind of material would be called "moire."

TACKING.—(From the Italian *Attacare*).—A term in needlework to designate small stitches taken through two pieces of material at wide and regular intervals. It is most securely effected by working from left to right. Designed to keep the two portions of stuff in place preparatory to their being permanently sewn together.

TAILOR'S TWIST.—A coarse silk thread made of several together, wound on reels, of two ounces each. The numbers used by tailors run from one to eight. There are small reels containing a single thread of 12 yards, equivalent to one yard of 12 threads. By this plan dealers can keep a larger supply of shades at a smaller cost.

TAMIS.—A worsted cloth, expressly made for straining sauces, and sold at oil shops.

TAMBOUR COTTON, made up in skeins, is sold in half bundles of five pound each, and used by tailors for basting. It is to be had in balls also. The numbers are 12, 14, 16, 18, 20, 24, 30, 36, and 40.

TAMBOURS.—Sprigged and spotted needlework muslins, of widths from 27 inches to 36 inches, and in lengths of 12 yards. They are semi-transparent. The needle has a small hook. Tambours are sometimes embroidered with gold thread.

TAMBOUR STITCH (otherwise known as "Chain Stitch.')—The work executed in this stitch is a very old style of embroidery, of which fine specimens are to be seen. The modern method of working differs from the ancient; the latter style was to draw the thread through the material from the wrong side by means of a hook, and so looping it.

TAMMIES.—These stuffs, like buntings, are made of worsted; yet, unlike the latter, they are plain, highly glazed, and chiefly used for upholstery. They are a kind of Scotch camlet, and are otherwise called "durants." They are twilled, with single warps, are usually coarser than twilled bombazets. Their width varies from 12 inches to 36 inches, and are mostly used for women's petticoats.

TAPESTRY.—Embroidery with colored worsteds, silks, and sometimes enriched with gold thread; anciently worked by hand with a needle, and in later times by the loom.

TAPESTRY STITCH.—The ancient "Opus plumarium," otherwise called "feather stitch." They lie lengthwise close together, and overlap one another, two threads of the material being crossed in the length of the stuff, and one in the width.

TARLATAN.—A thin gauze-like muslin, much stiffened; so called from Tarare, in France, the chief center of the manufacture. It is much stiffened, and may be had in various colors. It is much used for evening dresses.

TARTARIUM.—A fine cloth made in Tartary, and is mentioned in the wardrobe accounts of Edward III., and often named amongst the expenses of tournaments.

TATTING.—This work (otherwise called *frivolite*) is done with fine crochet cotton, and by means of a small shuttle, and a strong pin, attached by a chain to a ring, which is worn on the left thumb, the shuttle being held in the right hand. The thread is passed round the extended fingers of the left hand, and brought again between the thumb and finger of the thumb and first finger, the shuttle slipped under the thread between the first and second fingers, drawn out quickly, being kept in a horizontal line with the left hand. While the thread is held stretched by the shuttle, the second finger of left hand should let the loop under it slip, thus securing the cotton; and when a number of stitches are finished, they should be drawn together closely and so form a loop, which latter are united one to the other by the little picots introduced to form the purl-edge, round each loop. These are made by twisting the cotton round the pin, and holding it while forming a stitch. These loops are joined by making the picot in the first loop, where the connection should be made, and on reaching the corresponding place in the second loop the worker must draw the thread through the first picot, and pass the shuttle through the loop just made.

WHIFFS FROM OILDOM.

TO MY mind there are no ornaments we can put in our homes quite as homelike and attractive as those furnished by mother nature; especially if the house is not overstocked.

A few years ago we added a wing to our house, for kitchen and woodshed. This was joined to the old house in such a position that two windows from the former sitting-room and a door from the former kitchen which was converted into a sitting-room—opened into the kitchen. We decided to make a dining-room of the old sitting-room, and had one window cut down and a door hung, but the other window, what should we do with that? The casing was left and boards fitted in where the sashes had been, then papered over, but that did not suit us, it looked patched.

One day when out riding over our hills, I spied clinging to the side of a huge rock, the loveliest moss; great scales of gray Mosaics, overlapping each other, with here and there patches of emerald, I soon secured all that was easily removed and carried my treasure home.

The first question that met me there was: "O, mamma, what are you going to do with that? Can't I have it to make a playhouse?" I must admit the answer to the first was rather indefinite as I had not decided what to use it for; but the last question received a decided negative.

Entering the dining-room soon after, that bare window place stared me in the face and immediately an inspiration seized me; that eye-sore should be made a thing of beauty.

Accordingly the first leisure was employed with glue, tacks and moss. We left a space in the centre about 14 by 18 inches, only covering it with brown paper for future adornment. The remainder was all covered with moss. The casing was covered with running pine and tree moss for a frame. The center was afterwards converted into a very pretty fruit medley, by taking the pictures from fruit cans cutting them out close to the fruit and arranging them in order, then adding varnish. To make the picture more complete we took one of the large shelf-like fungi which grow on old logs and trees, of which we had several, used as door rests. We nailed this, inverted just below the chromo (?) forming a bracket, according to Jessie Seabrights' recommendation. We also made some mottoes of moss, by cutting the letters out of pasteboard, the desired size, then glued the moss on and tacked them in place. For the dining-room we have, "Eat, Drink and be Thankful." (Considering thankful more appropriate for a christian family than merry.) Over the front door made in the same manner, is "welcome." In the the kitchen, "Whatsoever ye do, do it heartily"

CORNELIA E. J.

PLAYING VISIT.

WHO of us—women folk—have not happy recollections of our childhood playtimes, the happiest of which are not of playing hide and seek or Kitty, kitty corner, but of personating grown up people and visiting, keeping house, teaching school, or being a doctor, a gipsy, or a peddler? And what a charm lingers around the memory of the mother, sister, or teacher who entered into these very earnest make-believes, and so made us really happy.

Every day, and often many times a day, a soft little rap on door or chair or couch announces a demure little maiden of four with generally a doll, and always a parasol. Although a dozen steps will bring her to my door, she never ventures out in any sort of weather without that parasol.

She sits down and we talk about her imaginary large family and mine; about her journey to the city, the chickens and the kittens, the news and the neighbors. When she rises to go away she wishes me always to say, "What makes you in such a hurry?" to which she answers, "O, I must get dinner for the boys," or "I must wash my dishes" or "milk my cows." and adds politely, "I should be happy—I should like to have you come over," or "I should be obliged if you would come and see me." After visiting is somewhat "played out" we play school, and have little lessons in letters and manners and music, and about our curious bodies. Then she is my physician, and brings me leaves enough for the healing of a nation—almost, and again she is my own sweet, thoughtful daughter, or my man-of-all-work, Tom.

How marvelously a disagreeable child is transformed into a winning womanly visitor by being treated courteously as one! Must we infer that the disagreeableness is caused by the general lack of such treatment? Can any one allege reason why innocent children thrown into our midst, without even their own consent, should not be treated with the respect and forbearance given to strangers—that is, so far as compatible with their best training? So poor, weary mothers, cousins, sisters and aunts, puzzled to know what direction to turn the irrepressible activities around you, play with the children, calling them grown people, and see how suddenly they become tame and even interesting, while you get glimpses of the man or woman surely to be developed in them if they live, and begin to regret the precious childishness to be lost in the process. The dear little things are so accommodating that they will excuse you for going on with your work, if you only ask them to do so, and may be they will be neighborly and help you, or even be your servant, and do with a good will what would otherwise be a task. Very important lessons in good breeding, treatment of visitors, and behavior before company may be given in these plays by a judicious person. Probably you will have to beg off after a while or turn their attention to something else, for girls especially never seem to weary of this amusement if they find kindliness and a little imagination in it; and this *inexhaustibleness* is perhaps the greatest charm of playing with children as if they were grown folks. ZENA CLAYBORNE.

ABOUT WOMEN.

MRS. Elizabeth Comstock, of Michigan, the widely known Quaker missionary, has visited 115,000 prisoners, and of this number she finds that 105,000 were brought to prison through strong drink.

Miss Mary McHenry, of Philadelphia, has made a singular contribution to the Lincoln relics. On August 13, 1864, John Wilkes Booth was a guest at the McHenry House, Meadville, Pennsylvania, and with his diamond he made this inscription upon a window pane: "Abe Lincoln, departed this life August 13, 1864, by the effects of poison." Five separate lines were made of this, after the manner of tombstone lettering. A few days afterwards the proprietor of the hotel removed the pane from the window, and framing it along with the autograph of Booth, which he cut from the hotel register, sent it to Miss McHenry.

MRS. Elizabeth Thompson, of New York, has given $500 to the Auxiliary Sanitary Association of New Orleans.

THE Empress of Austria is in Ireland again this year. She is still the sensation in hunting, possessing great strength and endurance. She spends many hours in the saddle and rides fast.

Miss Kate Field, of New York, contemplates establishing a Woman's Co-operative Dress Association. A store is one of the features of the enterprise.

Literary Miscellany.

A SUMMER VACATION.

ONE summer I was looking forward with more than usual impatience for my annual seaside holiday. When I say that I was a medical man, with a very large but not lucrative practice in a town, where an epidemic had been raging for some months, the reader will quite understand my strong desire for change of air and scene.

In plain but homely phraseology I was knocked up; the strain upon my energies had been immense. On many nights I had no other sleep than occasional dozes in an arm chair.

But the insidious disease had been conquered at last; there had been no new cases for several days. still I chafed, for there seemed no chance of getting away for some weeks longer at least.

It was at this juncture that I received an unexpected visit from an old friend of mine. We had been medical students together, but I had lost sight of him for some time. He was a young fellow of great abilities, and passed his examination with flying colors; but unfortunately for him, he was without the means which were requisite to enable him to stand a chance of getting on in his profession.

So he was condemned to the hard work and scanty pay which fall to the lot of a doctor's assistant.

But even this occupation had failed, when, as I have just said, he made a call upon me. Knowing his abilities, and finding that he had had a large amount of experience, I lost no time in suggesting that he should take my place for a month or so, while I took the holiday of which I was so much in need.

He was well pleased of course, and as soon as the necessary arrangements were complete, I was on my way.

It was here that I always spent my seaside holiday—not because I thought it the most delightful watering-place, but because some one very dear to me happened to be living there.

This was no other than my old nurse, Mrs. Chamberlain. To me she had been all but a parent, for my mother dying in my infancy, I had been left wholly to her care, and it was only natural I should continue to feel for her the warmest attachment.

My father, too, was dead. I had no brothers or sisters—indeed, so far as I knew, I had not a single relative alive. I was unmarried, too—so in this somewhat forlorn condition it is not wonderful that my affections should still cling to my old nurse; and worried and worn out as I was, I hastened to her with the old childish instinct which used to prompt me to hurry to her side when anything ailed me.

My old nurse had, during her years of service managed to save a little money, and with this had taken and furnished a pleasant seaside residence called Malcombe Cottage, and by letting the chief apartments during the season made a comfortable addition to her income.

On former occasions the good old lady had always contrived to have her rooms vacant at the time of my visit, and I had been in the habit of living there just as if it had been my own home and she my mother.

The abruptness with which I made my appearance at this time had interfered with her arrangements in this respect, and on my arrival I found that the best bedroom had been let to a young lady, who had announced her intention of living quietly there for some months. She had elected to board with my nurse, who now found herself in a difficulty.

This I proposed to solve by taking up my quarters elsewhere. Mrs. Chamberlain had thought of this, but could not bring her mind to it at all; and a few hours before my arrival she had laid the whole of the facts before her fair lodger, whose name I was informed was Linwood.

The result was that Miss Linwood had stated that she should be sorry indeed to interfere with Mrs. Chamberlain's arrangements, and that she would be quite willing to allow the circumstance of my arrival to make no difference to her; she would board with my old nurse the same as usual, provided I had no objection.

Without knowing anything at all about Miss Linwood, I felt I had an objection—though under the circumstances it would have been ungracious of me to express it—I could not help regretting the presence of a third party. In my low and worried condition I wanted perfect quiet along with nurse.

But when I was introduced to Miss Linwood all my disinclination vanished, and instead, I congratulated myself upon the good fortune which had brought me into companionship with so charming a specimen of nature's fairest handiwork.

I divined at once, from her manner and general appearance, that she was far above me in social rank. There was something quite indescribable about her, which showed clearly enough that she could with perfect right lay claim to the much-abused title of lady. Her first greeting was so kind and gentle, that I at once felt at perfect ease in her society, and to accomplish this, is, to my thinking, the perfection of good breeding.

Miss Linwood was somewhere about the average hight, and she seemed almost painfully thin. In spite of this, however, her every movement was full of grace.

As for her face, that was simply the loveliest I had ever seen; but there was upon it the mark of a great sorrow — an expression which said, plainly enough to me, that she had passed through some very heavy trial, and that she was suffering.

I felt for her at the same moment sympathy and curiosity, and I took the earliest opportunity I could to question Mrs. Chamberlain about her.

To my disappointment I could elicit nothing of any consequence.

"She has had more than her share of trouble," said nurse, "and she is quite a lady—there is no doubt about that. But as for her reasons for coming here, I assure you I have never so much as had a hint on the subject, nor has she made a single reference to her former life. It is very seldom she receives a letter, and I do not believe she is acquainted with anyone in the place. I found, too, by her awkwardness in many little matters, that she had been accustomed to the services of a lady's-maid; and when I volunteered to be of what use I could to her in this respect, she quite overwhelmed me with thanks, but would not permit me to wait upon her until I really insisted upon doing so."

All this was very peculiar—not to say mysterious—and the little I heard, instead of satisfying my curiosity in any way, only stimulated it.

Many were the theories more or less ingenious that I invented to account for her presence here, but every one of them proved untenable.

I thought, naturally, at first that she had suffered some pecuniary reverses; yet this notion was disposed of in a rather singular manner.

It was impossible to share the same sitting-room, to take our meals together, and remain as strangers.

Nor did it seem to be in any way her desire to be exclusive, and on my part all I desired was to cultivate the acquaintanceship thus strangely formed.

One evening we happened to be speaking of music, and I expressed rather warmly my passion for it, even in any shape.

"I, too, am fond of music," she said, in a voice which in itself was the sweetest music I had ever listened to—"very fond. I have thought that I no longer felt an interest in it; but I find I was mistaken."

Evidently there was some allusion to the past, and I said no more.

The next day, on my return from a fishing excursion, I found that the sitting-room had received an addition in the shape of a pianoforte.

"Here is a little surprise, Dr. Broughton," she said, with her sly, sad smile. "I believe I shall once more be able to feel a pleasure in music, and so I have bought this pianoforte. Do you like the tone?"

Bought a pianoforte! and of the best quality, I could tell as soon as she touched the keys! Bought it, too, at the seaside! My idea about lack of money was dissipated at once.

Music always affects me deeply—keenly. She played a few bars of some soft, sad air—played with so much feeling that my eyes grew moist. She was a musician of no mean order.—To be continued.

THE BLIND PRINCE.

BY MARGARET B. HARVEY.

Once there was a young prince who had never seen. Long had he prayed that he might receive his sight, but for just as long a time his prayers had not been answered. Still were his eyes closed to all that is beautiful in nature and art; still were the faces of his beloved friends unbeheld.

Save this one blessing he had almost everything that could have made him happy. Never had he known a day's illness, so to his other afflictions he did not add the heavy burden of a tortured body; his courtly position meant a freedom from all the distresses of want; his bright intellect had been well cultivated and he had almost in perfection that never-failing resource of the blind, a passionate love for music, combined with a wonderful skill in execution, so the horrors of a vacant mind were not for him; all of his relatives, without exception, idolized him, so he never conceived of the awful loneliness of the unloved. But this one black shadow hung over him, threatening to poison everything with its blight.

He had prayed long for his sight, I have observed. Rather should I have said, groaned and wrestled for it, fiercely demanded it, even called into question his Maker's goodness in denying it. It was very hard for him to bear, no doubt, and very natural for him to mourn, but such grief as his had none of the sacredness of real prostration under the Lord's mighty hand. It was rather childish, impotent rage, and as such was likely to spoil every good already his.

It was late in the afternoon of a beautiful summer day. The prince sat in a little pavilion in the garden, drinking in all of loveliness possible for him. For, though the gorgeous Roses and fair Lilies, tossing in crimson profusion and swaying in snowy majesty, were hidden from him; though the silvery spray of the fountain, falling among enwreathing ferns and mosses, were invisible to his veiled eyes; though the graceful trees and trailing vines, with the enclosing wall beyond, were covered from his curtained sight; and though the illuminated skies and red and gold lights streaming from them, bathing all in a bright, sunset glow, were as naught—yet the heavy perfume of the flowers, the musical plash of the waters, the soft rustle of the branches, and the gentle kiss of the breezes were all real to him. And so, too, was their blessed influence, stealing upon him ere he was well aware. Healing to his heart they carried, for a strange feeling of sudden tenderness came over him.

"Oh," he mused. "I know that all is beautiful around me now. Could I be any more keenly alive to it if I saw it? My Father's will must be best. I shall leave it with Him to restore my sight as He sees fit. But why this great joy, this springing exultation? My soul is full of melody."

As he spoke, he rose, crossed the garden, and stepped through the low window into the little room in which he spent much of his time. Seating himself at the organ, he ran his fingers over the keys, hoping to find some expression for the sweetness ringing within him.

His past life rose before him, wrapped in a heavy, black pall. And as memory after memory, scene after scene, came back, his fingers, half involuntarily drew out low, crashing chords of rage and dread, followed then by low, minor wailings of despair. But the gladness still reigned in his heart, and thoughts of the scent of the flowers, the fall of the waters, the waving of the trees, and the sighing of the zephyrs, seemed to intensify it; and the sounds of mourning swiftly changed into the earnest, solemn breathings of a hopeful prayer, succeeded by a few faint notes of timid exultation, which, gathering confidence, increased in number and volume, soaring as a simple, happy hymn of praise, and suddenly bursting into a grand, swelling, reverberating anthem of jubilee.

The last was a prophecy, although the prince knew it not. The timid strain of exultation, and the simple hymn of praise would have been a fitting end of his playing. For, wonderfully and entirely satisfied with the harmonies which he had called forth, he turned, with a shade of weariness towards the window from which he had come.

Like a flash was his quick exclamation, "I can see!"

The twilight had been stealing on, as he sat at the organ, filling all the room with dark shadows. But, through the casement came to him the dim sight of the garden, tinged with the faint light of departing day.

"Oh!" he cried; "And this is what it is to see?" And he stepped out into the walk, the same, yet not the same, and made a hasty inspection of the garden, scanning the familiar, yet unfamiliar objects.

"And this is color! I have heard that Roses were red, Lilies white, and leaves green,—I wonder how men ever discerned difference enough to give them different names. And I did not expect to find the grove of evergreens and the pavilion so much alike. But the light, the sunshine,—perhaps my being denied them has made me over-estimate them, for certainly, I was prepared to find them very much brighter."

So he went on, every step he took, bringing him some fresh surprise. For, as his sight had come to him just at dark, he did not know what day was. So absorbed, so bewildered had he been by this sudden awakening, that he had completely forgotten the existence of every human creature. But, before the deepest shadows overtook him, his tutor joined him.

As the prince heard the step, he cried, "Oh, Godfrey, I can see!" Then he felt of the newcomer as he had done in the olden time, and scanned him from head to foot.

"Godfrey, I see you! yet how strange! Your hair and your face, and the flowers and the trees are all the same color,—yet I had heard differently."

"The same color!" exclaimed the tutor. "Oh, my prince, do you not know that it is almost night and that you are looking upon everything in the twilight?"

The prince recoiled and trembled as though he would have fallen. Godfrey supported him.

"Let us praise God that your sight is restored. Let all dear to you thank Him. You shall sleep through the night safely and in the morning see the sunshine"

They gathered around him, all those who loved him. And though he feared when darkness again fell over him, they cheered him in gentle, tender voices. And at last the sun rose for him upon a perfect, unclouded day.

All the mysteries of color were solved for him, in the deep azure of the sky, with its fleecy clouds, in the swaying tree-tops, in the velvety sward, in the glowing heart of the Rose, the seraph robe of the Lily. All the grace of form was comprehended by him, in the tossing cedars and wreathing ivy and spraying fountain. All the wonders of light and sunshine were spread before him, in the gold flooding the green and the opals quivering in the water. Best of all, in one glance, he knew, as he had never known before in years, those whom he loved. His hour of triumph had come.

And thus it may be with many of us. We struggle on in darkness and despair, until we are willing to leave all with our dear Father. Then will He breathe into our souls a sweet consciousness of His tender care, so that we must change the song of our life from its sorrowful tones to those of joy in His love; and before we are aware, we may catch faint intuitions of our coming glory and sing of it in strains borrowed from choirs angelic. Then, too, a sight of His ways and dealings may come to us, true indeed, but seemingly dim and distorted when half covered with darkness, such as that in which we have spent our lives. But after *our* night, the glorious sun of His immediate presence will rise for us. And, whether in deed or in memory, we shall pass again through familiar scenes, illuminated with this light, those things which appeared to us dull and confused will be seen to be their very selves, but bright, clear and beautiful. And it may be, too, with the dawning of that day, the masks will be stripped away from the faces and hearts of our beloved, and we shall be one with them forever.

HISTORICAL SNATCHES.

The United States Mint was established in 1793

Weights and measures were invented in 869 before Christ.

Policy of insurance in writing was first used at Florence, in 1569.

Gunpowder was invented in 1330, and cannon began to be used about the same time. They were first employed by the English at the battle of Cressy, in 1346.

Organs were invented and applied to religious devotion in churches in 758. They were brought from the Greek empire to Europe.

Soap was first manufactured at London and Bristol in 1524.

Blankets were first manufactured in England in 1340.

Japan was discovered in 1542, and visited by the English in 1612.

Gas was first used in London for lighting shops and streets in 1814; introduced in the United States, at Baltimore in 1821.

Cape Horn was first sailed around in 1516.

Gipsies left Egypt when attacked by the Turks in 1515, and wandered over a greater part of Europe.

Cæsar was assassinated 43 years before the Christian era.

Distaff spinning was first introduced into England by Bonavera, an Italian, in 1505.

LaFayette was 19 when he came from France to assist the Americans.

BRIC-A-BRAC.

SIGNS OF THE SEASON.

When the wind blows east alway,
And the roads like rink-floors ring,
And you cough and sneeze all day,
Then men say it 's "merry Spring!"

When the rain pours day and night,
Skies look glum, and faces glummer,
And hay-fever 's at its hight,
Then, of course, it's "glorious Summer!"

When sole change from catching colds
Is in wondering how you caught 'em,
And grey mist the land enfolds,
They you know it's "genial Autumn!"

When cold water takes two shapes,
Drenching *douche* and icy splinter,
And the world 's all coats and capes,
Then be sure it 's jolly Winter!"

"There was a young man with a shaddock,
Who met a young maid with a haddock.
He thought, 'How I wish
She would give me that fish,
In legal exchange for my shaddock!'

"The maiden who did not like haddock,
Thought, 'Oh, what a beautiful shaddock!
If I were not so shy,
I should certainly try
If he'd give me that fruit for my haddock.'

"He went on his way with his shaddock;
She went on her way with her haddock;
And so cruel is fate
That until 't was too late,
Neither of them heard
That, by speaking the word,
He might just as well have had haddock,
And *she* might as well have had shaddock!"

Turning the tables.—Some few years since, in the county of Penobscot in the United States, there lived a man by the name of H——, whose greatest pleasure was in tormenting others. His own family were generally the butts of his sport. One bold and blustering night he retired to bed at an early hour, his wife being absent at a neighbor's. Some time after, she, on returning, finding the door closed, demanded admittance. "Who are you?" cried Mr. H——. "You know who I am! Let me in—it's very cold!" "Begone you strolling vagabond! I want nothing of you here!" "But I must come in!" "What is your name?" "You know my name it is Mrs. H——!" "Begone! Mrs. H——is a very likely woman—she never keeps such late hours as this!" "If you don't let me in," replied Mrs. H——, "I will drown myself in the well!" "Do, if you please," he replied. She then took a log and plunged it into the well, and returned to the side of the door. Mr. H——, hearing the noise, rushed from the house to save, as he supposed, his drowning wife. She at the same time slipped in and closed the door after her. Mr. H——, almost nude, in turn demanded admittance. "Who are you?" she demanded. "You know who I am. Let me in, or I shall freeze!" "Begone you great rogue! I want nothing of you here!" "But I must come in!" "What is your name?" "You know my name. It is Mr. H——!" "Mr. H——is a very likely man—he don't keep such late hours!" Suffice it to say, she after keeping him in the cold until she was satisfied, opened the door and let him in.

I think of thee, sweet William,
And I long to hear from you;
Send me a missive, won't you, please,
Oh, come now, *billet-doux*.

A Backsliding Cat.—A first-rate cat story has come to our notice from an entirely authentic source. The scene is laid in the village of Yarmouth. An aged gentleman and his housekeeper constitute the family, and their good old cat finds the lines are fallen to her in pleasant places. Family prayers are the rule each evening in this household, and the cat fell into the habit of regular and punctual attendance. No other of the cares that proverbially crowd a cat's life was ever allowed to interfere with this religious duty. At the signal for prayers she would even leave a mouse half caught, or give a doomed bird a longer lease of existence, and decorously compose herself in the lap of the housekeeper, with an air of attention to the service that was highly edifying. At the final "Amen" she went friskily about her business. But in an evil day there came a kitten that was deemed superfluous, and sentence of death was passed upon it. The head of the family undertook the execution of the sentence, and, unknown to him, the cat was a witness of the scene. From that day the cat refused to attend the morning service, and cannot now be induced to listen to the prayers of one who had so shocked her sensibilities. She faithfully performs all other duties as before, and socially purrs for the family on all secular occasions, but seems to say: "Let my religious hours alone."—*Portland Trans.*

Sabbath Reading.

A SONG OF HOPE.

FROM THE GERMAN OF OVERBACH.

Why are tears so many
In this world of ours?
Why are sighs so heavy,
Making long the hours.

Nay, then, Christian brother,
Will you still rebel?
Bear the trouble under;
All will still be well.

Up, and shout with spirit;
God's eyes are not dim,
And His children's sorrows
All are known to Him.

He delights to gladden—
Sing His praises out—
With His own hands strewing
Blessings round about.

Only this weak nature
Bears not much of mirth,
So He sends some canker
In the joys of earth.

Till in death we slumber
And return to dust,
All the gifts He sends us
Are but lent in trust.

Make not such commotion
For the things of time,
There are treasures yonder
Waiting to be thine.

Are we not from slumber
Waked from morn to light?
So our life-long trouble
Lasteth but a night.

Night will soon be over,
Day comes on apace;
Ere we can believe it,
We have run our race.

Let us, then, be patient,
Schooling each our soul;
Waiting till the day break
And we reach our goal.

Then will all be over;
Then we shall be free,
Singing songs of triumph
Through eternity. A. C.

We men and women, moving in the common ways of the world, are yet deriving our life from, and in spirit dwelling with, One at the Father's right hand. From that "sitting with Him in the heavenlies," comes all the strength and gladness of our lives. By his unseen grace our nature is nourished; from his fulness our hearts are satisfied. Such communion is understood, even from the common affections of life.

"Underneath thee are the everlasting arms," We have not to wait for Divine succor in the hour of need. It is already there. When we are about to sink, it is by anticipation, "underneath" us. "God is our refuge and strength; a very present help in trouble."

This world, with all its wealth and splendor, hangs but a golden drop in the immensities of God—in the illimitable immensities that open before the soul.

Good prayers never come creeping home. I am sure I shall receive either what I ask or what I should ask.—Bishop Hall.

Miscellaneous.

THE RILEY CONTROVERSY.

To the Editor of the Rural New-Yorker:—Sir:—The impartial reader will weigh the evidence in my reply, already published, with the specious testimony in your issue for March 6th. I care not to be drawn into controversies with persons who can either know nothing of the facts, or find it politic to forget anything that bears evidence in my favor; or to their interest to construe at their master's beck conversations to suit him. If Mr. LaDow is not an indifferent reporter, he *knows* that his purported reports are "incomplete, garbled and misleading" to my injury, and that my general statement of them correctly gives their substance. As to the gratuitous opinions of one who so servilely lends himself to misrepresentation, they are beneath my notice. Having no desire to extend this controversy "without limit," I simply beg you, in conclusion—both to dissipate a suspicion in my own mind that you are making Commissioner LeDuc's case your own, and to justify some statements which I had verbally made in regard to my reply before it appeared—to bear witness, by their publication, to the following facts:

1st, That you suppressed the (for me) most important part of the evidence in relation to Mr. Carman, Chief Clerk of the Department, which I twice sent to you; 2d, that while announcing that you regretfully surrendered so much space to my reply, you declined to omit six different passages and letters which I crossed off in the "proofs" with a view of keeping, as far as possible, other persons out of the controversy; 3d, that all these passages were on page 125, *i. e.*, in the "form" that last goes to press, and that it could not have been too late to make the changes, because the proof was returned by Friday of the week previous to publication, and corrections were made on page 128 in the form which first goes to press. Respectfully,

Washington, D. C., March 6, 1880. C. V. Riley.

[We are sorry Professor Riley entertains a suspicion that we are making Commissioner Le Duc's case our own. We published Mr. E. A. Carman's letter of modification, as requested. We did *not* publish Prof. Riley's explanation of that letter, for the reason that it reached us too late. Nevertheless, the suppressed letter which Prof. Riley

deems a most important part of his evidence, is now presented.

2d. Prof. Riley requested us to forward the printed "proofs" of his reply to him for correction. We did so. These proofs were returned to us with so many parts crossed out and so many additions that the alterations could not be made without upsetting our pages and delaying our usual time of going to press, for although the proofs were mailed in Washington on Friday, they did not reach us until Saturday, on which day a part of the paper went to press. If Prof. Riley were really desirous of keeping certain persons out of the controversy, why did he put them in? It is not fair that we should be held responsible for the after-thoughts of those who send us matter to be published. It was our wish, however, to have made all the alterations indicated—a wish we urgently expressed to our foreman. His reply was that the alterations involved a half-day's work and that they could not be made if the "forms" were to go to press at the usual time.

The Commissioner has asked for neither proofs nor corrections, and we cannot imagine upon what grounds Prof. Riley is suspicious that we have made this case our own.

Professor Riley says that he does not care to be drawn into controversies with persons who can "find it politic to forget anything that bears evidence" in his favor.

It seems that he himself has forgotten the letter he wrote to the Editor of the RURAL NEW-YORKER requesting the expression of an opinion as to his fitness, etc. We have produced the proof. We have offered additional proof. And yet he still forgets. He now states that he deems it of very little consequence whether he did or not. But in this we beg to differ. It was one of the distinct charges we brought against him, and it was as distinctly denied by him. If Professor Riley has really forgotten that he wrote such a letter, we have only to say that he should be tolerant of others' forgetfulness.—EDS.]

The Missing Letter.

THE following was addressed to Mr. E. A. Carman, Jan. 30th, by Prof. Riley:

In a published card addressed to Hon. W. G. Le Duc you make certain statements regarding my resignation.

With a view of refreshing your memory as to the facts, I beg you to glance over the inclosed copy of my own statement thereof, and to answer plainly the three following questions:

1. Is not my statement correct?
2. Did I ever express to you a desire, or did any one else ever state to you, on my authority, that I desired to be reinstated?
3. Was not my conversation last December in New York to the effect that had you been more earnest in disabusing the Commissioner of his error, my resignation might have been prevented; in short, was it not in reference to your action prior to, and not after, said resignation?

Upon refreshing his memory, he gave me the following answers in writing:

To the second question: "No."

To the third question: "From further explanations given, and circumstances recalled, I am led to believe that it was."

In conversation Mr. Carman has shown a natural unwillingness to correct his previous statement, which he admits he has hastily made, and without any idea of its being published. He gave me the above answers with the reservation to explain the whole matter more fully, and has preferred to do so directly to you. [See letter from E. A. Carman in RURAL of Feb. 21, page 125.—EDS.]

I simply reaffirm that Mr. Carman, whose kindness I otherwise fully appreciate, has, in this matter, done me wrong in his first mis-statement, and that the facts are just as I have narrated them.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

THE SERVING OF REFRESHMENTS AT WEDDINGS, PARTIES, ETC.

"CONSULTRIX."

DEAR HOUSEHOLD:—I have from week to week taken great interest in your department, and have each time thought of some item I could contribute; but family cares have absorbed so much time and attention that I, perhaps like hundreds of others, have let time pass and have feasted weekly upon the labors of others. Having recently had the pleasure of visiting country people, some of them wealthy and all well-to-do, my thoughts have crowded upon me in this wise: Country people—and where is there a better class to visit?—do a great deal of work, and much of it is unnecessary. For instance, when they have weddings, parties or social gatherings of any kind, they think they must follow the old custom of setting a long table and of serving every one in the regular way. If the dining-room be too small for the company to sit down all at once, there must be two or three tables set, as the case may require; those who do this work are frequently overworked, and it spoils all enjoyment, so far as they are concerned. In reality, the hostess should be the one to assist in entertaining, and should be able to enjoy the society of her own guests. People that have ever lived in the country know that the lady of the house is expected to have full charge of the culinary department, no matter how much help she has; hence we see how hard this custom bears upon the farmer's wife.

Now my remedy:—I once knew a family living in the suburbs of a capital city, who had a number of small, plain tables made, which were kept for guest tables when they had a gathering of any kind (heavy dinners excepted). The company were served with refreshments on these little tables. Now, why cannot a number of farmers in one neighborhood own as many of these as they should ever want, each paying a trifle to an ordinary carpenter to make them, and let the one having the most house-room take care of them. The family I have mentioned put them over-head in the wagon-house. Beside saving work it is such a pleasant, social way; the formality of the great table disappears and the guests can sit down by twos and trees as best suits, and be served; in summer under the trees is a nice place, and in winter, all about the different rooms. This is much easier than any of the old ways, one of which is to try to hold a cup and plate on your lap, succeeding in eating a little, and spilling a portion of your coffee on your clothes.

These tables can be covered with towels, napkins or anything handy, and the serving can be done the same as at a picnic. Another convenient way is to have all food prepared and set upon the dining-room table, along with piles of dishes sufficient for the guests. Then each one can help him or herself, or the gentlemen can help the ladies, one servant being sufficient to pour tea and coffee as desired. I have attended large parties where but one servant was seen, although there were several in the house. I have no doubt that a goodly number who may read this article will think it foolish to waste paper upon a subject which all ought to know already; but I was once young and inexperienced and also had a season of living in the country, and at that time I would have been glad to have learned a few of the things herein contained. If there shall be one person benefited, I shall feel that my time is not lost.

SCRAPS.

MARY BEAL M'LOUTH.

I WAS sorry to see in a late RURAL, directions for scattering swellings, boils etc. Although I know some good practising physicians who recommend iodine, calomel, etc., for swellings, yet I never would use them, having so many times seen the ill effects. Let us reason. A swelling indicates impure blood. If red, there is inflammation, and necessarily fever. Nature is taking this course to rid itself of poison which is in the blood. And to put on a preparation to dry up this, or send the poison over the system, is only prolonging the trouble. Two physicians have advised me to use iodine for goitre, or swelled neck. I was afraid, and let it alone. Since then I have known two deaths from its use. The iodine reduced the goitre, but the persons were prostrated on beds of sickness and were kept there until they ceased taking medicine, or until the neck was allowed to swell again. After a time they commenced iodine again and death ensued. Again, in several cases a white powder, which proved to be calomel, was used to kill erysipelas: after every dose the patients were taken with cramps in the stomach, which continued until the swelling was poulticed, and once ended in death. The verdict of the people was. "I believe he would have lived had they kept off the calomel." A poultice made of bread and milk or flax-seed, is good for allaying out the inflammation, but continue to keep moist as long as the swelling discharges, or shows any signs of fever. A dose or two of castor oil would assist nature in cleansing the system. For goitre, I would recommend wearing gold or silver beads. A weight over the spot seems to keep it in check.

To renew old bread for tea: During the forenoon, steam a whole loaf half or three-quarters of an hour, and then wrap until needed, in several thicknesses of cloth.

To paper whitewashed walls: Wash the wall in hot vinegar the day before. If very old I would scrape off, first, what loose lime I could. This is not quite as tedious as making paste to cover the wall, and the paper will stick as well as though the wall had never been white-washed.

CANNING FRUIT AND TOMATOES.

IN reply to the request of your correspondent on the canning of tomatoes, I will say that I have used only glass jars for canning fruit for many years previous to last year, at which time I used a few peach and oyster cans which had been washed out and dried immediately after emptying, and kept in a clean place. This was done at the suggestion of a friend who told me that she had used such cans for years with perfect success. Not a can was spoiled, but in one kind of new glass jars there was a coat of mold, which very much injures the flavor of fruit for me, although some others think not. This I attributed to the kind of jar, but tried the same jars this year and found the fruit—tomatoes—perfect. I cook my fruit carefully and usually put in just the sugar which will be needed when eaten. For years I supposed my good success was owing to the seasoning, but I now think, after making fruit air-tight, that the jars should be kept in a cool as well as a *dark* place. As for the different kinds of glass jars, I have many patents, and think they will all keep fruit well, if made air-tight and kept cool. Mine have not always been kept in the dark—I speak of this more particularly, because I feel the importance of investigating and finding out, if possible, the true cause of failure in the putting up of fruit. I cannot tell why Mrs. Fisher's tomatoes became sour, but should attribute it to anything but a well-sealed glass jar. They may have been too warm—probably were. Bits of decayed tomato will cause the fruit not to keep well although air-tight. I know of several persons who lost their fruit last fall, as they supposed, by putting in bits of decayed pieces. And yet, while not as good, they might possibly have been saved, if they had been put in a cool cellar as soon as canned. My experience is that if fruit will keep "six weeks" in warm weather it will keep always, and be the better—much the better for its age.

To make darkness sure and keep out Jack Frost, who prowls around in a sly manner in our Minnesota homes at this season, I put fruit jars in boxes and cover them with saw-dust, and I have yet to take out the first jar that is spoiled. AUNT FLORA.

APRONS.

An apron is a little thing in itself, but it is a great thing in our need for it—an absolute necessity whenever there is work to be done. And just because it is made to be worked in and cannot on that account be disassociated from labor, I would have women lay them off when their work is done—I know dozens of women who are never without one on. Must we wear this badge of a toil that, though unceasing in its daily round, may admit of pleasurable intermissions. *Must* we wear it whenever we go out to call upon a neighbor, or to visit a sick friend? If not, why *will* we do it?

A little girl who was getting ready to attend an afternoon party came in tears to her mother:

"O, ma, I can't go; my apron is all mussed up."

"Well, child, go without it. You will not need it, I am sure."

"O, yes, I will, ma, for I've tored my dress." *That* apron, at least, had an excuse for appearing in company. ADELINE E. STORY.

DOMESTIC RECIPES.

To Preserve Citron for Cake, etc.

IN answer to your correspondent, I give the following method for preserving home-grown citron for puddings, cakes and pies: Allow three pounds of sugar to 14 pounds of citron. Put the sugar into a preserving kettle with two quarts of water, boil and skim. Cut the fruit into pieces of convenient size, put in only as much of the citron as the sirup will cover, cook until you can pierce the pieces with a straw, then place upon plates to dry. In this way cook all of the pieces. Should there be any sirup left, boil it until very thick and pour a little over each plate. A small bag of whole cloves and cinnamon may be boiled with the sirup if one likes the flavor of these spices. Pack in jars with powdered sugar sprinkled between each layer. H. WEST.

To Color Butter with Carrots.

To color five pounds of butter, grate off the deepest-colored portion of a clean, good-sized carrot, pour over a teacup of warm water, let stand fifteen or twenty minutes, then strain through a cloth and add to the cream just before churning.

Carrot Coffee.

Select the smoothest carrots, wash clean, cut into small pieces and dry slowly until thoroughly dry. Then brown delicately and it is ready to use without grinding.

MRS. A. E. L.

To Color Nankeen.

Procure some ground bark at the tannery, put into a brass kettle, add water and let soak over night. In the morning boil up and put in your cloth, previously wet in alum water. Boil half an hour or longer. The adding of a little lye will make the goods darker. L. M.

Trees, Seeds, Plants, &c.

E. & J. C. WILLIAMS,
Montclair, N. J.
Have a large *prime* stock of all the leading **Strawberries, Raspberries, Grapes,** and other Fruits at reasonable prices. Customers always satisfied. Catalogue free.

News of the Week

MISCELLANEOUS.

Monday, March 27, 1880.

Prospectors and settlers are already overrunning the Ute reservation in Colorado ahead of the formal placing of the territory in the market, and Secretary Schurz sends out word that no claims made under these circumstances will be respected by the Interior Department. The President is expected to issue a proclamation on the subject, if the encroachments continue. Reports already come from the region in question of the massacre of trespassing miners by the Indians. Trouble is also anticipated up in Montana, because of a treaty just made between the Crows and Sioux. ..... Vanderbilt's restoration of 10 per cent. to the salaries of the employes on the "family roads," adds $500,000 to the annual expenses of those lines. The Pennsylvania company is about to restore prices to their old standard.... .....

The country received in the first two months of 1880 three times as many immigrants as the first two months in 1879. Nearly twice as much iron is being made now as in 1879. Railroad building is going on from half to twice as fast as last year. Week by week the imports are from 30 to 40 per cent greater than last year. The exports are little, if any larger....A bill for the reduction of fares on the New York elevated railroads to five cents at all hours, passed the Assembly but was killed in the Senate, at Albany....About 4000 New York piano makers have been locked out because Steinway & Sons' 700 striking employes refuse to accept the terms offered them...

An awful boiler explosion took place in a flax mill belonging to Lenman, Rosenthal & Co, at Frankfort, Ind., on the morning of the 11th inst. Ten men who happened to be assembled in the engine-room were instantly killed and the building completely demolished. One body was thrown 150 feet. Cause: old and imperfect boiler. . . Dennis Kearney's defiance of law and decency has come to a crisis, and it is to be hoped that it is the beginning of the end. He was arrested while eating his breakfast a few days ago, on two distinct charges, viz.; for using foul language, which is a violation of a city ordinance, and for threatening to kill a person, both of which offences were made in a speech on the sand lots the evening before. The offender was brought before a judge the following day and sentenced to six months' imprisonment in the House of Correction and a fine of $.. 000. The general feeling among those who have noticed the doings of this reckless blasphemer is that he has received justice and nothing more. The fact that he has committed the same offence a thousand times without receiving punishment does not argue that he should be allowed to continue his outrages unmolested.

AGRICULTURAL NEWS.

Philadelphia turns out daily from 8,000 to 10,000 of oleomargarine.....At the county agricultural shows held in Illinois during 1879, the entries were as follows: Short-horns, 1,961; Jerseys, 324; Devons, 251; Holsteins, 137; Ayrshires, 122, and Herefords, 104. These figures may be taken as indicative of the comparative interest taken in each breed in that State.....A cablegram of the 17th says that in consequence of unfavorable weather in Egypt a large area of cotton land must be resown and the crop will be late..... On same date it is told that the winter sowings of wheat in Russia have suffered greatly from frost .....Mr. William H. Vanderbilt has purchased fifteen hundred acres of land at Oakdale, N. Y., on which he proposes establishing an extensive stock farm....A telegram from the Los Pinos Agency, dated March 14, says that a number of parties have already staked placer claims and taken up ranches on the Ute reservation, and that the next two weeks will see the reservation swarming with trespassers and a conflict is inevitable. The agent requests that traps be ordered to the reservation to protect the Utes..... ....Mr. Conover has introduced a bill into Congress to appoint a scientific Commission of three chemists and two microscopists to establish legal tests for butter and oleomargarine.....Constant arrests of oleomargarine swindlers are being made here, in Philadelphia and in several other cities, but convictions are difficult on account of the difficulty in proving the stuff oleomargarine, and from the strong "backing" given the retail swindlers by the wholesale dealers.....Gen Le Duc, in answer to an inquiry gives the average of wheat in Nebraska last year at 11.2 bushels, and of corn at 45 bushels per acre; and of wheat in Kansas at 11, and corn 33 bushels per acre.... The Texas cattle drive for 1880 is expected to exceed that of 1879 by at least 75,000. Three-fourths of the cattle coming North are expected to concentrate about Dodge City, Kansas.....The cattle dealers of Victoria, Texas, who virtually regulate prices in nearly all that State, have fixed the prices at present at:—yearlings, $6; two-year-olds, $10 to $12; three-year-olds, $17@18. These are the highest figures for years, and it is doubtful whether they can be maintained.....All the cattle were saved from the Guion steamer Montana totally wrecked near Hollyhead, Wales, on the 12th inst.....Both Ga., and Tenn., had extremely heavy rains of late. A telegram from Atlanta on the 15 says the streams were nearly all overflowed, doing much damage to crops. In Tenn 12.35 inches of rain fell out of a yearly average of 52 inches. The Tennessee and Cumberland Rivers were higher at above date than at any time since 1847, causing much loss to stock and crops.....Mississippi raised most cotton last year, Texas came next, 75,000 bales behind, but Texas bales are usually considerably larger than those put up elsewhere.....Very heavy snows on the Pacific Coast.....Epizootic has broken out among the horses at Washington..... Maine is to introduce 2,000 migratory quail this spring .....France has 1,574 beet sugar factories. .....A glucose manufacturing Co. has been started at Atlantic, Ia.; capital, $150,000..... The Sandwich Islands exported last year about 46,000,000 pounds of sugar.....The Cuba sugar crop is reported to be about 40 per cent. smaller than last year ...Oregon has offered $100 for the best acre of sugar beets and $50 for the second best. ..Representative Anderson, of Kansas, has introduced into Congress a bill appropriating $50,000 for exhibitions at agricultural fairs of the process of making sugar from sorghum, corn-stalks, etc..... .. Oswego farmers have subscribed $75,000 towards a beet-sugar factory and want $25,000 more. There's a movement to petition the N. Y. Legislature for a bounty on sugar beets..... There's a brisk American demand for Canadian horses. Lately 131 were shipped from Toronto to Massachusetts and New York in a single week, costing $9,819, or an average of $75 each..... Land and Home, the new agricultural paper that started bravely in this city a few months ago discontinued last Saturday.

Advice to Consumptives.

No man, however uncleanly, would drink muddy, dirty water. A party who occupies a room for hours, breathing the same air, might be compared to a party of bathers drinking the water in which they bathe. The patient must keep the window of his bedroom open. Night air is fresh air without daylight. In close, crowded rooms, the patient suffering from lung complaints breathes consumptively. By taking these precautions and using Dr. Pierce's Golden Medical Discovery and Pleasant Purgative Pellets, fully one-half of the cases of lung complaints would be cured in six months. For cough and irritation of the lungs do not always indicate the presence of consumption, although they may result in that disease and if consumption has already become deeply seated in the system, this is the most efficient course of treatment that can be pursued, outside of any institution that provides special facilities for the treatment of this disease. Dr. Pierce's celebrated Invalid's Hotel is such an institution. Send stamp for descriptive pamphlet containing also a complete treatise on consumption, explaining its causes, nature, and the best methods of treating it, together with valuable hints concerning diet, clothing, exercise, etc., for consumptives. Address World's Dispensary Medical Association, Buffalo, N. Y.

A JOKE ON THE PUBLISHERS.—A Boston publisher recently issued Thos. Hughes' (author of "Tom Brown's School Days," etc.) "Manliness of Christ," in a neat volume, for $1, and a New York publisher coming out with a competing edition, the price was reduced to 25 cents. To make the rivalry interesting, a third publisher, The American Book Exchange, New York, whose "Literary Revolution" has been scattering consternation among publishers and cheering the hearts of impecunious lovers of good books, brings out a neat acme edition for three cents, or entirely without cost to buyers of the April number of their Library Magazine.

WE call special attention to the advertisement on page 210 of important Clydesdale and also of Hambletonian horses, for sale by Powell Bro's Springboro, Crawford Co., Pa. The horses are of the best breed and the firm in every way trustworthy.

A Favorable Notoriety.—The good reputation of "*Brown's Bronchial Troches*" for the relief of Coughs, Colds and Throat Diseases has given them a favorable notoriety.

Burnett's Cocoaine has been sold in every civilized country, and the public have rendered the verdict that it is the cheapest and best Hair Dressing in the world.

For an Irritated Throat, Cough or Cold, "*Brown's Bronchial Troches*" are offered with the fullest confidence in their efficacy. They maintain the good reputation they have justly acquired.

BAUGH & SONS' prices for goods delivered at depot or boat, in bags and in 2,000 lb lots: Ammoniated dissolved bones, $35; pure bone meal, from raw bones, $36: Baugh's raw bone superphosphate $40; Baugh's $25 phosphate, $25; Baugh's A. A. nitrogen, 13½ per cent. of ammonia, $48.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 20, 1880.

BEANS AND PEAS.—The market for white beans is dull; and a further reduction in prices has only succeeded in bringing out a few Cuban shippers of marrows. White kidneys are wanted; but there is a lack of large lots. Red kidneys abundant and and weak. Green peas quiet at $1.75@1.80 Wis. bbls. Southern B. E. peas offered at former bids. $1.90@2 per 2 bush bag, and some business may result. Marrow beans, prime, $1.60 other, $1 45@1 50; medium, prime, $1.45; other, $1.30@1.37; pea, $1 45@1.70; white kidney, $1.60@1.80; red do., $1.50@1.65; black, $1.80@1.85.

Receipts of beans for week, 8,664 bush.; exports, 618 pkgs.

BEESWAX.—There is a lighter business and a steady market at 24 to 25 for Western and Southern.

BROOM CORN.—Demand is slack and is for small lots; Nominal quotations are for choice brush at 9c.; choice hurl at 8c.; stalk braid at 6@7c.; mixed red and green at 5@6c.

BUTTER.—The demand for fine fresh is active and receipts are not plenty enough to give all buyers a share on some days. Prompt shipment is urged for new. Old butter is now so reduced in stock that settled rates cannot rule long. It is quite evident from the range of rates for S ate that the best has been absorbed. Western holds a strong place and for the moment holds the steadiest price—position. New butter must be as perfect as hay feed and cold weather will permit to bring the extreme. Avoid injudicious coloring and specially avoid mixing old with new. New butter is quoted: creamery best, 37@38c.; fair to prime, 33@35c; poor, 29@30c. State, pails and tubs, choice, 34@35c.; fair to prime, 28@33c.; poor, 25@26c. Early made creamery 29@30c. Fall pails and tubs, fair to prime, 25@30c.; poor, 22@24c.; dairies, choice, 28@29c.; other, 22@27c.; bodies of firkins, 21@23c. Very poor State, 18@20c.; Western imitation creamery 29@34c.; Western dairy, fresh, 29@30c.; poor to prime, 21@28c. factory extra, 29@30c.; other, 21@27c.; very poor 15@18c.; rolls, have advanced to 22@27c.

CHEESE.—The dealings are small, shippers doing little and there are free sellers, with prices without marked change. Exports for the week 3,300 boxes.

Quotations are for State factory: best at 14@14½c.; good to prime at 13¾@14c.; fair to good at 13@13½c; do. poor at 12@12½c. State farm dairy: good to prime at 13½@14c.; fair to good at 13@13½c. Ohio factory: Cheddar, fine, 14c.; do., fair to good, 12¾@13½c.; flat, fine, 14@14¼; flat, good to prime, 13@13½c.; flat, fair to good, 12½@13c.

Receipts for week, 5,630 pkgs.; exports, 3,100 boxes Liverpool cable, 71s.
Steam 32s 6d@35s.

COTTON—Has been active, closing for March at 13 08@13 09c.; April, 13.15c.; May, 13.33@13.31c.; June, 13.52c.; July 13 64@13,65c.; August, 13 72@13.73c; September, 13 37@13 39c.; October, 12.49@12.51c.; November 12 11@@12.13c.; December, 12,06@12.08c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—Apples have a good demand and rule steady in price. Peaches are quiet and unchanged. Blackberries are scarce and lower sellers; other small fruits are quiet. Prices are for N. C. apples, fair to good, 7¾@8½c.; choice, at 9@9¼c.; fancy at 10@10½c; Virginia, at 7@8c. New York State quarters, at 7@8c.; sliced at 7¾@8¼c.; patent evaporated, choice in cases, at 13¼@14c.; prime at 12½@13c. Evaporated peeled peaches, good to choice, at 22@23c.; unpeeled at 12@14c.; North Carolina peeled, fancy, at 20c.; choice old at 17@18c.; Georgia prime at 15@17c.; fair to good at 14@15c.; common at 10@12c.; unpeeled halves at 7½@8c.; do. quarters at 7@7½c. Pitted cherries at 18@19c. Blackberries nominal at 14c. bid. Raspberries at 26@27c. Plums at 17@18c.

Exports for week, 215 bbls. dried apples.

EGGS.—Receipts for the week, 25,450 bbls.; do. last week 14,6 9 do. Heavy receipts have dropped the market beyond sudden recovery. Cheap prices have brought out a better demand for use, but stock is accumulating. Near Point eggs are very plenty this season, next week ought to take much of the supply at the rates ruling for good stock.

Near Points, ₩ doz., 13c. State and Penn. 12@12½c. Western, fresh, 11@12c.; Southern, 11@11½c.; poor marks Western and Southern 10@11c.; duck eggs 24@25c.; goose 45@50c.; limed almost nominal at 9@10c.

FLOUR.—Prices have declined and closed weak through larger receipts and the lower wheat market. Buyers have been very indifferent.

Latest prices are $4.60@5.30 for poor to fancy superfine state and Western; $5.25@5.50 for inferior to very good extra do., old and new lots; $5.50@5.75 for good to very choice do.; $5.25@5.60 for inferior to good shipping extra do, and $5.60@5.75 for good to very choice shipping extra do.; inferior to good choice white wheat extra $6.75@6.90, about choice to very fancy do. at $6.80@7.85 for red and amber winter wheat, inferior to fancy trade and family, at $5.60@7.40; round hoop Ohio, $5.35@5 75; and trade and family brands of do. at $5.85@7.60, the latter rate for fancy; St. Louis at $5.75@6.90 for inferior to very good extra; $6.80@7.15 for very good to fancy; Minnesota clear, inferior to fancy, at $5.50@6.80; Minnesota "straight," inferior to very fancy, at $6.25@7.75, and patent inferior to fancy at $6.75@8.75; Ransom stock at from $5.25@5 75; city mill extra at $6.25@6.75 for ordinary to fancy for West Indies; do. for England, $5.25@5.80 for poor to choice; do. trade and family extras, $6.20@7.25 do. for South American, $6.50@7.00; No. 2 at $3.35@4.20 for poor to fancy.

FURS AND SKINS.—With a renewed demand for Germany the market is better for parcels conveniently available. Stock in the interior may not be favorably affected by the stronger tone now current here.

FRESH FRUITS—Exports of apples for week, 7,615 bbls. The export demand is the main support of the apple trade. Greenings are now very variable in quality, and it is difficult to find a long line of choice Baldwins. The general range, including Russets, is $2@3 50 for poor to best. Barrel stock used up. Cranberries winding up at $3@3 50 ₩ crate. Strawberries have dropped to popular prices, and sales are broken; quoted 10@20c. ₩ qt. Fla. oranges scarce and firm, the last end of the season is proving the best; fancy at bbl. or box, $4 25@5.75, fair to prime, $2.50@4. Peanuts have a steady demand, at full late rates. Hand-picked Va., 5¾@6c.; extra prime to fancy, 5¾@5¾c.; good to prime 4¾@5c. Shelled, 5¾@6c. The Producers' Price Current gives the comparative receipts of peanuts as follows:

Oct. 15, '79	to March 20, '80,	64,161	bags.
" 15, '78	"	20, '79, 60 432	"
" 15, '77	"	20, '78, 29,657	"
" 15, '76	"	20, '77, 46,047	"
" 15, '75	"	20, '76, 37,979	"

Hickory nuts dull at 75@90c.

GRAIN.—Wheat has been pressed for sale at lower prices and has been active on export account. The shipments for the week are 960,000 bush. Latest prices are of No. 1 white at $1.41@1.42½; do., March, at $1 41@1.42 do., April, at $1.40@1.40¾; do., May, at $1.38; ungraded white at $1 40@1.41; No. 2 red at $1.40¾@1.47; do., March, at $1.45¾@1.46; do. April option, at $1.44¾@1 45; do., May, at $1.41¾@1 42¾; No. 3 red (Kansas grade) at $1.37@1.37½; ungraded red at 1.39@@1.40; mixed winter at $1.43¾@1 44. Corn is active and closed firm; latest sales are of New York No. 2 at 58¾@58¾c.; do. old at 59@59¼c.; New York No. 2 for March, at 57@57¼c.; do., April, at 51¾@54¾c.; do., May, at 52¾@52¾c.; New York steamer mixed at 58@58¾c.; do., March, at 56c.; ungraded mixed Western at 57½@59½c.; yellow western at 59c; No. 2, white at 60@60c.; steamer white at 60@61¾c., round yellow at 58c.; 8,000 bush. No. 2 May at 52¾c. Oats active and closed firm; latest sales are of No. 1 white at 43@43¾c., No. 2 white at 46@46¾c.; No. 3 white at 45@45¾c.; New York No. 1 at 46½c., New York No. 2 at 45¾@45¾c.; do., March option, at 45c; do., April at 44¾c.; New York No. 3 at 45@45½c.; ungraded white western at 48¾@49c.; ungraded mixed western at 45@46½c.; white State at 49c.; No. 3 Chicago about at 46½c.

HOPS.—Demand continues very light and prices are unsettled and in a good degree nominal. Quotations are for

	Cents per lb.
New York, fancy	37 @39
New York, new crop, good and choice	33 @36
New York, new crop, medium	31 @33
New York, new crop, low to fair	27 @29
Eastern, new crop	27 @35
Wisconsin, new crop	27 @35
Yearlings	7 @13
Olds, all growths	4 @10
Pacific Coast, new	30 @35
Pacific Coast olds (nominal)	5 @10

MAPLE SUGAR.—Supplies are liberal and good quality will be apt to encourage trade. Prime large to small molds 10@13c.; syrup in tin 90c.@$1 ₩ gal.

OIL CAKE.—Western is inactive and quoted at $32 ₩ ton.

PROVISIONS—Have declined and closed weak on a moderate trading. New Mess pork closed at $11.80 for spot delivery; 11.50@11.55 for April and $11.60 for May. Bacon at $7, for long clear and 7¾c. for short clear. Lard—Western steam at 7.55 for new on the spot, 7.54 for April, 7,55 for May. Stearine at 7¾@7¾c. for Western. Tallow at 6 7-16 for prime. Beef hams at $16.50@17. Beef—Extra India mess in tierces quoted at $18@20. extra mess at $11@12, plain at $10 50@11; packet at 11 50@12.

Receipts for week, pork, 2,100 bbls., beef, 1,135 pkgs.; bacon and cut-meats, 47,400 pkgs.; lard, 25,900 pkgs. Exports, pork, 3,852 bbls.; beef, 3,061 pkgs.; cut-meats and bacon, 17,357,205 lbs.; lard, 7,100,800 lbs.

POULTRY AND GAME.—Hotels and steamers are now the chief buyers of dressed poultry; prices too high for local trade. Large turkeys not wanted by any trade; ducks scarce and firm; geese hardly inquired for; very little frozen poultry offering.

Turkeys, N. J. good to prime, 16@16c., State, Mich., N. Ohio and Penn., prime, small 15@15½c.; other Western, prime, small 14@15c.; fair to good, small 13@13½c. Western dry-picked, small 14@16c.; large 10@12c.; Phila. dry-picked, 14@16c.; Capons, Phila, large, 20@21c; and slips, small 17@18c.; chickens, winter Phila., 21@22c.; yearling Phila., dry-picked, 17@18c.; N. J., 15@16c.; State, prime 13@14c.; Western, 12@13c.; fair to good 10@12c.; poor to fair, 7@10c. Fowls, Phila., dry-picked, 13@14c.; N. J. good to prime 12@13c.; State good to prime 10½@13½c.; Western, good to prime 10½@12c.; poor to fair 8@9c. Ducks, Phila d.p. 19@21c. N. J. 17@18c.; State 16@18c.; Western 14@17c; Geese Phila d. p. 10@12c.; N. J. 10@12c; State, 9@11c.; Western 8@10c.; squabs, white ₩ doz., $3; dark, $1.50@4.00 Live poultry in moderate supply, and firm. Fowls, 12@13c.; turkeys, 11@12c.; and ducks, 75c.@$1; geese, Jersey, $1.75@2; N. Y. and Pa., $1.50@1.75. Western, white, 75c.@$1.25; gray, $1.25@1.50; do.; late winter chicks 60c. ₩ pair fair size. Game is hardly a marketable item. The few small birds depend upon special call, and wild ducks have almost worn out their welcome. Eng. Southern snipe $1.25@1.75. Wild pigeons $1.25@1.75; the latter for Penn. Canvas back ducks $1 75@2; Red head, 50@75c.; Mallard, 40@50c.; teal, 40@50c.; common, 15@25c.

SEED—Clover is weak; Western is quoted at 7@8c; and State at 8@9c. Timothy is quoted at $3@3.05 and demand small. Flaxseed is quoted at $1.80@1.85.

VEGETABLES.—Exports of potatoes for week, 2,375 bbls. The market for potatoes is generally dull and prices, as a rule, are shaded.

Bermuda, new ₩ bbl., 6@16.50; Florida, new, $3; E. Rose, N. C., bulk ₩ bbl. $1.35@1.50; Maine, per d.-h. bbl., $1.75@1.87; State, do. $1.25@1.50; State, in bulk ₩ bbl., $1.25@1.50; Prolific, N. S. per d.-h. bbl., $1.25@1.50; do., in bulk, ₩ bbl., $1.25@1.50; Mercer, Nova Scotia, bulk, per bbl., $1@1.25; Chili red, N. S., bulk, ₩ bbl., $1.12@1.63; Peachblow, State, white, per d.-h. bbl., $1.75@1.87; do., State, red, per d. h. bbl., $15.00@1.62; snowflake, State, per d.-h. bbl., $1.00@1.75; Peerless, State do. $1.12@$1.25; do., bulk, ₩ bbl., $1@$1.37; Jersey bulk, do., 62@67c.; Sweet potatoes, $3 00@3.25. Southern truck has had irregular sale, as the weather has been bad for marketing. Fla. peas no longer wanted. Fla. tomatoes, ₩ box, 75c.@$1.25; Nassau, 70c. $1.25; Bermuda, 60c.@$1; do., beets, new, ₩ crate, $1.75@$2; string beans, Fla., ₩ bush. crate, $3.50@4; green peas, Sav., per crate, $3.@1.75. Cabbage, $1@1.75; Asparagus, Charleston, per doz, $8@9; sale, North, ₩ bbl., 75c.@$1.00; Baltimore, per bag, 75c.@$1; spinach, North, per bbl., $2@$2 25; Baltimore, $1.2 @1.50; radishes, Norfolk, ₩ 100 bunches, $1; lettuce, Md., $2.50; squash, marrow, per bbl., $1.50@1.75; Hubbard, $2.50; cabbage, Fla., new, per bbl., $3; do, old, per 100, $3@10; onions, white, $4@5.50; yellow, $3.50@3.75; red, Eastern, $3.25@3.50; Chester, $3@3.50; beets, Jersey, $1.50, turnips, Russia, 62@75c. carrots, $1@1.25. Hot-house produce—Cucumbers, ₩ doz., $3@3.50; radishes, ₩ 100, 3@3.50; do. rhubarb, $5@8, lettuce, Boston, ₩ doz., 25@75c.; L. I. & N. J., 25@50c.; do. carrots, $2.

TOBACCO.—Demand is moderate, with prices steadily held.

WOOL.—There has been less activity this week, but the full recent advance is sustained; latest sales are of X, XX and XXX Ohio at 35@39c.; No. 1 do. at 34c.; common to quarter blood combing at 57½c.; XX at 44c. for State; scoured California at 52c.; scoured Colorado at 48c.; low do at 52½c.; scoured Texas at 35c.; fall California at 21½@35c.; Montana at 42c.; unwashed Iowa at 36c.; Oregon at 45@46c.; fine foreign noils at 30@36c.; scoured East India at 52c.; South American do. at 62c.; Montevideo at 42@42½c.; Cape at 37@37½c.

LIVE STOCK MARKETS

NEW YORK, Saturday, March 20, 1880.

BEEVES.—Receipts for week, 12,769 head; do. last week, 12 623 do. The export trade has been very active. To-day's steamers have taken car loads of fine Illinois steers; about 700 head in all sail March 20th. An extremely stormy day on Friday depressed the latter part of the week's market, and the ranges annexed are very full; poor to fair steers, 5@5¾c., dr., 55@56 lbs.; good to prime, 9¾@10¾c. Very common neglected

COWS AND CALVES.—There is quite a strong feeling, and though receipts are free $35@58 per head have been generally reported.

VEAL CALVES.—Supplies of live have enlarged with spring and prices have an easy tone. Poor lots not salable. Choice N. J. and Bucks Co., 8c.; fair to prime other, 5@7½c.; Mt. Holly, 6¾@8c.; grass calves, 2@3c.; buttermilk, 4@4½c. Dressed calves show the most weakness: choice, 9¾c.; other, 7@9c.; grass hog dressed, 4@5c.

SHEEP AND LAMBS—Receipts for week, 25,144 head; do. last week, 21,272 do. A decline in wool and pelts has helped to weaken prices for sheep. Common to extra sold at 6¾@7¾c. good to choice yearling lambs, 8@8¾c.; N. J. spring lambs ₩ head, $4@6.50.

SWINE.—Receipts for week, 24,475 head; do. last week, 24,473 do. Market steady at $4.80@5.16 ₩ 100. Country pork, light, 6¾@7¾c.; medium, 6¾@6¾c.; heavy, 5¾@6¾c., city dressed, 6¾@6¾c. Tenderloins, 10c.

TERMS FOR 1880.

STOCKBRIDGE
MANURES
For 1880.
Some years ago the Stockbridge Manures were only known to a few farmers in the Connecticut Valley. Now they are so extensively used in different parts of the country as to require two large factories, one in New York and one in Boston to manufacture them. This increase shows what farmers think of good fertilizers, and is not only due to the fact that they are reliable, well-made, and high-grade manures, but also to the fact that farmers have
FOUND THEM PROFITABLE TO USE.
Now that corn, and other farm produce is bringing such good prices, we anticipate that farmers will invest still more largely in our fertilizers.
Besides the Stockbridge Manures, we manufacture several high-grade Phosphates, and deal in first class chemicals of all kinds. Farmers who intend to use Fertilizers of any kind, should

Reading for the Young.

REMINISCENCES OF A LITTLE GIRL.

MRS. M. J. GALPIN.

CHAPTER V.

I HAVE never yet described the looks of Father Tom and his wife. I have been so intent on following the fortunes of the hapless pair, that I overlooked personal description. Mrs. Silk, at the time of her marriage with Uncle Tom, was but 25 years old; and just in the full bloom of youth and beauty. Although seven years older than her husband, she always looked younger, during all the years of her life. She was tall, and supple as the willow, while all her motions were airy and graceful as those of the fawn. Uncle Tom was the one love of her life, as she was forced into her first marriage by the will of her headstrong, father and a desire to get away from his stern rule. I have never seen a lovelier complexion than hers, one in which the lilies and roses were so artistically combined. She had a suit of hair that fell in shining curls far below her waist, large liquid, dark eyes, and perfect Grecian features, (quite unlike the Irish type of beauty). No one could call Uncle Tom handsome. He had a large forehead and a cranium that measured 24 inches in circumference. He was of medium hight, had large blue eyes, an open honest countenance and was a man who from his *tout ensemble*, one would naturally trust as being worthy of all confidence.

When Uncle Tom (as we will call him henceforth) came home and told his wife that he had at last obtained a chance to earn an honest livelihood, she was delighted at the prospect, but when she found that it would imply separation for months, she resolved to follow him in his journeyings through the country, and no amount of argument could shake her resolution. She had the unfailing argument that she had given up everything for him, and with him she would be till death should separate them. It was finally arranged that she should go, and when he was on a surveying trip she could remain at the nearest village or point on the work. For many weary months they traveled with the surveying expedition, through the country visiting more towns and villages than I could enumerate to you in a day. Whoever has been to Ireland knows the natural beauty of the scenery. Bold mountain ranges, foaming cascades, barren peaks and emerald verdure are the characteristics of the country. All these attractions combine to make the Emerald Isle "the pearl of the ocean", "first gem of the sea."

Once on coming to a village in their route, and having obtained a place to stay over night they found a "wake" was in progress next door. The "keeners" were on hand, the "potheen" was hot and everyone felt comfortable, and prepared to do the full amount of mourning for the dead. To the cool observer of these "wakes" the custom looks like a most ridiculous farce, and so it really is, but you must know, my dear little ones, that the customs of different countries alter the situation, and what seems foolish to us, may be quite a serious matter with others. Perhaps you never have heard or read of an "Irish wake" so I will try and describe one as related to me by Uncle Tom in my childhood.

When a person dies, all the neighborhood and friends gather in the afflicted house; whiskey punch is made called "potheen," pipes and tobacco go round, and then some old crone commences to tell of the good deeds of the deceased. All they can think of in his favor is rehearsed not forgetting to call upon their imaginations, which under the fumes of the whiskey are very lively. Then the keeners or cryers commence operations. They fall on their knees beside the coffin, and bewail the dead in a monotonous singing tone, rising and falling to suit the expression they intend to convey. To hear them one would think their hearts were broken, whereas they are only hired to cry. After telling all the good deeds, they commence to call down maledictions on the enemies of the deceased; and here let me say that no nation under the sun can excel the Irish in making evil wishes against those they hate. An Irish marriage and an Irish wake, are something similar, only that if anything the wake is the merriest; here they enjoy the tobacco and whiskey the most. I wonder if my readers have ever heard of the "Banshee."

Well, there is a superstition in Ireland that before the death of any member of the family, the Banshee will cry for several nights, never less than three, and when her cry is heard consternation and sorrow take hold of the living. I think the Irish banshee is like the "mermaid" of the sailors for the peasantry, who profess to have seen her, say that she is lovely and is nearly always sitting on a rock in the sea or by the sea shore. I wonder if she is related to the "Lone rock by the sea." But the faith that the people have in her is wonderful, and I shouldn't wonder to day if Parnell or Dennis Kearny, heard that the "Banshee" had been heard or seen near their dwelling in Ireland but they would go to the priest to get consolation, as they would expect their hour was come. But, dear children, it takes a good many strange things to make a world.

MY LABORATORY—NO. 2.

S. RUFUS MASON.

My work hands, although having an experience of nearly 6,000 years, are still a little irregular in their habits. They let the soil get poor, my plants suffer, crops don't pay, even my pretty flowers grow smaller and smaller, so from my "little room for improvement," I issue my orders. At once mold, or humus, leaves its rich bed and goes to the poor spots, but if left on as a coverlet, soon dries up and becomes worthless. We therefore cover it up, mix it through the poor soil, and at once, as by magic, the plants grow as they should. If for potatoes, when much potash is needed, we apply ashes, and the same for Strawberries, because ashes from burnt wood contain potash in plenty. Coal ashes are useless as a fertilizer, but are good on heavy, stiff clay, to keep it from becoming too hard for vigorous plant growth. To produce a luxuriant growth of almost any plant, a little guano may be used. This powerful helper of mine is a dangerous fellow, however. His strength is wonderful, so we may mix him up with twenty times his bulk of common soil, before trusting him among our seeds or tender roots, else he would kill everything right and left. Sometimes rain becomes too frequent a visitor; he is a sad dog when let loose in a garden, but we get rid of him by making trenches on the surface to let him run off downhill, and loosen up the soil, that he may run down below the roots, ready to rise again when the sun, saying "dew come, dew come," calls him in summer. The sun takes a spell also, and dries the soil, the plants, roots, stems and all, but we attack the soil again with hoes and rakes, loosening it, to let up from below the excess of rain already there. When the supply of water in the soil is deficient, we cover the garden with anything to keep in what little there may be. We call it mulch, and it may be saw-dust, half-rotted straw or hay. Old half-rotted manure, fresh-cut grass, or any rubbish which will keep the sun out, and the water in.

Water in cultivation is as important to plants as to cousins in hot weather. These cousins, you see, I count as among my helpers; they occupy a corner of that "little room" I speak of, and when the race becomes improved it will be due altogether to the amount of cultivation they receive.

I will propose a mode of proving that cultivation is manure. I want each cousin to plant a few long blood beet seeds this season, to select a few, and hoe them just often enough to keep down the weeds, and then select a similar lot and hoe them well every morning, throwing the earth well up around them each time, and report progress on Oct. 1, 1880, to Uncle Mark. There will be some knowledge of gardening gained, some laudable pride indulged in, some little bragging, and some beets that can't be beat, as well as some that can.

Now, I must introduce my particular band of assistants to the cousins. They are human; they are all first cousins to each other, and the most important of the whole lot. Their names are Industry, Application, Love of Labor, Great Care, Close Attention, Perseverance, Courage, Pluck, Patience and Push.

Every cousin who loves flowers has some of these, and can cultivate all the rest, and what is very curious, in so doing will cultivate her mind, her health, her circle of friends, her grace and her beauty. A study of the topic, which I have touched but lightly, will lead to much good. It will develop principles. There is a principle governing every step in cultivation, which, if well understood, will tell how, when and where to work, and also why—the great why, the stumbling block to all beginners, the first thought which enters one's mind when set to work.

Why must I do so? The usual answer given by ignorant persons is this, 'cause—but, 'cause why. Why 'cause. That stops all further inquiry, but Nature is kind in heart, and to those who will study her always gives the true reason. So, my dear cousins, first think, then inquire, then apply. Never stop asking "Why" till you know everything, then keep your knowledge bright by constant use.

Can any of you tell a gardener's spade from any other? Notice that it is always bright and clean by constant use and care. Even the handle becomes smooth and polished.

Three other helpers, though last, not least, I employ in my laboratory. Order, Neatness and Dispatch I call them, but if well treated they come without calling.

What greater pride can a cousin have than to walk out to her garden with a handful of seeds, and say to her friend, "Here are the seeds, there are the plants; without my care and labor they would have still been seeds." All then that stands between a seed and its flower is a little cousin, first cousin to the seed, third cousin to the flower, while they are second cousins to her. "Oh, my!" says Kitty Clover, "that's worse than roses on watering-pots."

Dodge Co., Nebraska.

THE SEED DISTRIBUTION.

Ere this reaches the young readers, the members of the Horticultural Club will have received their seeds, and the present distribution will be closed. The selection consists of seven kinds of seeds, two kinds of vegetable seed, and five kinds of flower seed. Their culture will be given at length in another issue, as want of space does not permit me to publish it this week. UNCLE MARK.

LETTERS FROM THE COUSINS.

UNCLE MARK:—I take my pen once more, this time to enquire what has become of the members of the club. I open the paper, week after week, and see not more than two or three letters, and those as a general thing are from those who wish to join. Of course the many that join make it all the more pleasant, but if they only write two or three times and then drop it they will hardly be profitable members. Those who used to interest me very much are utterly silent now. Will not Ivy favor us with a few lines once more? What a mild, pleasant winter we have had thus far. Yesterday (Feb. 2,) I had some Pansies in bloom in the open air, where they had been all winter, with no protection whatever. To-day they are surprised by a heavy wind and snow storm. I have D. M. Ferry's Catalogue for 1880. Among the nut trees of which he speaks, I see the names of the English walnut, or Madeira nut, the almond and pecan. Can these trees be grown in Massachusetts? We are having very few flowers on our plants this winter. Last year we could, at most any time, pick a small bunch of fragrant flowers. We are not at all fortunate with house Roses. I suppose we do not give them proper treatment. Perhaps some of the cousins will be kind enough to tell me through the paper how they manage to make theirs grow so nicely. I must report a failure on Smilax, too. I put it away in a dark place, giving it very little water, in the summer, that the bulbs may rest. When it springs up I bring it to the light gradually. It grows fast until about six inches high, then stops, and, although looking green and fresh, it refuses to climb an inch higher until the next autumn. I must close now. CARNATION.

New Bedford, Mass.

DEAR UNCLE MARK:—I am a little boy seven and one-half years old. I go to school every day. I can read in the third reader, and know the multiplication tables; am learning addition now. I love to go to school and study, my teacher Mrs. Winans is kind and good. I have a dear, "curly-headed," little sister four years old, and a black-eyed baby brother six months old. I go to church and Sunday-school. I love flowers and wish to join the "Club," with the rest of the little cousins. We had no snow this winter, so I couldn't draw my sled; maybe we will have some yet. I have two dogs, Dick and Nell. I try to be a good boy. This is the first letter I ever wrote myself. No more at present from your little friend, FRANK E. GALPIN.

Marshall Co., Kans.

Glad to hear from you, Frank; write again.—U. M.

UNCLE MARK: If you will receive me as a member of the Horticultural Club, and the members will receive me as a cousin, I will try to write a letter. I do not know much about flowers or vegetables. We have a few flowers and vines. I will tell you some of them. We have some Roses, Flowering Almond and some others, beside some little flowers. We have no box flowers. We have one vine that we call clinging Ivy. It will stay green all the time. It clings to several trees in our yard. I don't know whether it will kill the trees or not. It may but it has not killed ours yet. Well, my letter is getting long enough for the first. If it is printed I will write again. Please put my name on your list. Good-bye for this time.

Griffin, Ga. COUSIN URIOLE.

UNCLE MARK.—I should like to join the Horticultural Club if you will place my name upon the list. I am a lover of flowers and have generally good success. I like to read the letters from the cousins very much. Your well-wisher.

Butte Co., Cal. ALICE E. SNYDER.

The Puzzler.

HIDDEN SOVEREIGNS.

1. IT is an insult and I'll resent it.
2. Did you see our pet dog, Edward?
3. What a temper Orsina exhibited?
4. In a fit of pique Ena quarreled with her lover.
5. I did the problem on Archibald's slate.
6. Madame Dupres, I dented it unintentionally.
7. I read the edict at Orlanda's office.
8. I saw Eric Z Arin at the opera-house.
9. The skin grew quite inflamed.
10. As for the result a natural idot could guess.
11. Papa shall I go?
12. In her music Zara makes rapid improvement.
13. Take the pig over no road.
14. Draw it taut Oera that it may bear a tug.
15. I choose ecru, Lerma.
16. Essie, hie fast away.
17. Rie a lip has no use for a moustache.

BRIEFLETS.

TRANSPLANT Rhubarb and Horse-radish. . . Be ready for grafting. . . The Germantown Telegraph says: We never heard of a case of fire-blight in a pear-tree in a city yard. So of cracking in Pears. . . Peaches Apples, Cherries, all may fall; but when a Pear once comes in, it is tolerably sure to have more or less fruit every year. . . Mad. Charles Wood, Chestnut Hybrid, Triomphe des Beaux Arts and Paul Neron are fine Roses. . . In pruning shrubs, bear in mind that to prune those which bear flowers on the old wood, is to lose a corresponding number of flowers. Such shrubs should be pruned just after blooming, so as to give them a chance to form flower-buds for the next year. . . The Gardeners' Monthly calls attention to the Lantana as a summer-blooming plant. Few things beat it in beauty and the hotter and drier the weather is, the more freely it blooms. . . Mr. Dreer's new strains of Coleus are creating quite a sensation. . . Prune grape-vines. Remember that the same wood never bears grapes twice. The advice may seem needless but we have known persons to cut away all of the last year's growth and to wonder why their vines bore no fruit. . . One of the Alden apple driers at Adrian, costing $10,000, has paid for itself in five years! . . About 400 bushels of green fruit may be dried every 24 hours. It employs 60 hands. . . In reply to inquiries for canning, probably there is no better variety of green corn than Stowell's Evergreen. . . Mr. Harris thinks that barley will command a good price the coming fall. A great point in raising barley is to get it of the best quality. The land must be dry, clean, mellow and rich. Mr. Harris has used superphosphate with decided advantage. . . Sow as early as land can be put in good condition. Sow at the rate of two bushels per acre. Six-rowed barley is the most profitable kind to sow, as it usually brings from 10 to 15 cents more per bushel than the two-rowed. . Two-rowed barley is rather later than the six-rowed, though heavier. It produces, also, more straw. . . "Thoughts and Events" says: "It passes the understanding to explain why the free press should consider abuse a weapon of civilization.". . "Chaste as snow, thou shalt not escape calumny," ought to be worked in worsted and put up at all nominating conventions to deter sensitive candidates. . . Never expose a great private wrong until it is very plain that it is a public wrong. . . We hope that subscribers of the RURAL NEW-YORKER interested in our seeds, will give the mangels a good chance and that they will very generally compete for the premiums to be offered for the best roots. . . Pride and Plenty spread rich repaste, but Love must sit at the board to perfect the banquet. . . A writer in the Journal of Agriculture says: "If the Grange is a failure, it only proves the truth of the old adage, that our worst enemies are those of our own household; for we all know that if the farmers would unite in one grand, harmonious whole, the balance of power would be in their own hands," which is true enough. . . The RURAL NEW-YORKER has little to do with politics *per se*. But we should much like to see a larger proportion of farmers and a smaller proportion of lawyers among our legislators. We should like indeed to try for the once a farmer-president We hold that the intelligent study and practice of agriculture better fit a man to govern our country wisely than does the study of any other science, pursuit or profession whatever. . . Mr. Furman says that men who make their money in speculative ways, fail in farming nine times in ten. . . Col. Piollet says: "I wish I possessed the power to arouse the mind of every farmer in this land to resent the dastardly attacks that have been made upon a Department which, for the first time in its history, has a practical educated farmer at its head."

Humorous.

"BLESSED are the peacemakers," said the small boy when he dropped a costly porcelain ornament.

"IF I punish you," said mamma to her little girl, "you don't suppose I do so for my pleasure, do you?" "Then whose pleasure is it for mamma?"

FATHER (who is always trying to teach his son how to act while at table)—"Well, John, you see that when I have finished eating I always leave the table." John—"Yes, sir; and that is all you do leave."

Marks of Approbation.

In the shape of increasing demands for Hostetter's Stomach Bitters are constantly reaching its proprietors. The mining and agricultural populations of the far west are particularly alive to its merits, for it possesses the very qualities which emigrants to those remote districts require. It protects them from malaria, it fortifies them against the injurious effects which frequently proceed from a mode of life fraught with hardships, and it has an unimpeachable record for thoroughness. Travelers to foreign countries, mariners, and those generally who live an out-door life, will find that its protective and bracing properties have not been exaggerated by the many who have borne favorable witness in its behalf. A rock is not firmer on its base than this medicine in the confidence of our people.

NEW POTATO,

"ST. PATRICK."

In appearance the ST. PATRICK is undoubtedly one of the handsomest Potatoes ever grown; it has a smooth white skin, and white flesh, few and shallow eyes; in shape it is rather oblong than round, and has no core or hollow; it is also a strong and hardy grower, and, from all accounts, has withstood the rot so prevalent last season better than any other sort. It produces but few small tubers, ripens medium early, and, finally, it is enormously productive and of fine quality.

At the Fall Exhibition of the New York Horticultural Society, held in this city, September, 1879, the ST. PATRICK shown by us was awarded the First Premium over all other Seedling Potatoes exhibited.

Price 50 cts. per lb., by Mail.
Or by Express or Freight, $2.50 per peck; $8.00 per bushel; $30.00 per bbl.

We also offer selected stocks of the following leading Seeds:

		¼ lb.	1 lb.
BEET.	—Early Blood Turnip	$0.10	$0.35
"	—Dark Red Egyptian	0.20	0.75
ONION.	—Early Flat Red	0.75	2.75
"	—Wethersfield Red	0.60	2.00
"	—Yellow Danvers	1.00	3.50
"	—Yellow Dutch	0.90	3.25
RADISH.	—Round Dark Red	0.25	0.75
SPINACH	—New Savoy Leaved	0.15	0.40

If by mail, postage must be added at the rate of 16c. per lb.

Catalogue for 1880, free on application.

PETER HENDERSON & CO.
35 CORTLANDT ST., NEW YORK.

COOLEY CREAMER.

Awarded Gold Medal at Paris Agricultural Exhibition, 1879.

Butter made by this process, awarded Sweepstakes at International Dairy Fair, 1878, and Two Gold Medals and First Premium at same fair, 1879. First Premium at Royal Agricultural Exhibition, London, 1879.

It requires no milk-room.
It raises all of cream between milkings.
It affords better ventilation.
It requires less labor.
It is more thoroughly made.
It is cheaper,

and gives better satisfaction than any other way of setting milk.

Send for "Dairymen" giving full particulars and testimonials.

VERMONT FARM MACH. CO., Bellows Falls, Vt.

PIANOS AND ORGANS

PIANOS $150 TO $400 (with Stool, Cover and Book)—All strictly First-class and sold at Wholesale factory prices. These Pianos made one of the finest displays at the Centennial Exhibition, and were unanimously recommended for the HIGHEST HONORS. The square Grands contain Mathushek's new patent Duplex Overstrung Scale, the greatest improvement in the history of Piano making. The Uprights are the finest in America. Catalogue of 48 pages—mailed free.

JUBILEE ORGANS, the best in the world. An 8 stop organ only $55; 13 stops, $97—with all the latest and best improvements, possessing power, depth, brilliancy and sympathetic quality of tone. Beautiful solo effects and perfect stop action. Solid Walnut cases of beautiful design and elegant finish. Circular free. All Pianos and Organs sent on 15 days' test trial—*freight free if unsatisfactory.* Don't fail to write us before buying. Positively we offer the best bargains. Factory and Warerooms, 57th St. and 10th Ave. SHEET MUSIC at ¼ price. Catalogue of 3,000 choice pieces sent for 8c. stamp. Address,

MENDELSSOHN PIANO CO., Box 2058 N. Y.

THE GREAT AMERICAN TEA COMPANY

Try our NEW CROP TEAS, all kinds, 60c. per lb. This is the first time these Teas have ever been offered at 60c. Same quality sells in stores for 80c. and $1.00 per lb.

ALL EXPRESS CHARGES PAID on $5 orders. EXTRAORDINARY INDUCEMENTS ON LARGE ORDERS. Send postal card for further particulars.

Horticultural.

NOTES FROM THE RURAL GROUNDS.

The Chinese Yam, Dioscorea Batatas.

The accompanying sketch of this vine was made last season from a specimen that has been growing here for several years. Little need be said as to the value of the roots. They grow from one to three feet in length, largest at the bottom. They are quite tender, breaking almost like a pipe-stem, so that, if grown in large quantities as a field or garden crop, the labor of digging them would cost more than the crops would be worth when harvested. As an ornamental plant, the Dioscorea is of much value. It is in every way as desirable as the Madeira Vine, while the roots, being quite hardy, the vine, when once started, needs no further care. The growth of the stem from the time it appears above ground until about June 10, is remarkable. It is like a *purple rope* without leaves or leaf appendages of any kind. This "rope" attains the hight of from 10 to 15 feet before the buds push, living meanwhile upon the nourishment stored up in the root, being a biennial in its nature, the same as the carrot, beet, parsnip turnip, dahlia or sweet potato. We mention this because it has often been stated that the Chinese Yam increases in size from year to year, whereas the yam of one season dies during the next. In early June lateral buds push and the stems soon become wreathed in

CHINESE YAM—DIOSCOREA BATATAS—(From Nature.)—Fig. 102.

foliage, as is shown in the engraving. It is well to pinch the leading buds if a closer growth of foliage is desired. Respecting the rapidity of the growth of this vine, we may say that several years ago, we tied a string as a mark and found by exact measurement that in 24 hours the stem had grown *eight* inches.

The flowers are borne in delicate racemes and emit a pleasant cinnamon fragrance, from which circumstance an enterprising individual, several years ago, sought to introduce it as a new plant under the name of "Cinnamon Vine." By this name it is still known in many places. In the axils of the leaves little tubers form which may be described as resembling miniature Early Rose potatoes. After the first frosts, these fall and, if buried in the earth, will sprout the ensuing spring. Or they may be collected and kept through the winter the same as potatoes.

The plant is dioecious. We have in this country only the male, so that true seeds never form. It seems odd that, in view of its beauty, the female has never been introduced, so that we might hope to raise seedlings of different varieties.

The large leaf within the vine and the bulblets underneath are of life size.

Our Free Seed Distribution.

In the RURAL of Feb. 28, we published instructions for the treatment of the seeds now being distributed to our subscribers. Since then we have received so overwhelming a rush of orders that our stock of Bebb's Hybrid Aquilegia has been exhausted, and being unable to procure more, we have been obliged to introduce a substitute for this variety. This substitute is a musk melon named "New Surprise" and we trust the "surprise" may be as pleasant as the fruit is excellent. This variety is entirely new. It originated in Washington Co., N. Y., and we have secured seed of the original stock. The fruit is of medium size, with thin, light-colored, finely netted skin and deep salmon-colored flesh. The culture of melons is so simple and so well known that it would be superfluous to give special directions for the planting of the seeds and care of the plants.

Field Crops.

HISTORY OF A POOR FARM.—No. 24.

Seeding to Grass.

GRASS is the most valuable crop we can grow, even upon a farm where soiling is practiced. Where land is cheap and the interest on its cost is low, pasturing is the most convenient and economical manner of feeding, but where the interest charge is twelve or fifteen dollars per acre, it will not pay to pasture cows.

"What does it cost to feed a cow?" asked my old neighbor. "I never kept any account on my farm and I don't know anything about what this or that costs, or what it pays. It is too late for me to begin now; but I see that a young man ought to know how to do it."

"It depends upon how a cow is fed," remarked Mr. Martin. "If a cow is fed upon straw in the winter and a run on a poor pasture in the summer, she may be kept for about $5 a year, and it will take very little milk or butter to pay for her feed and make a good profit; 100 per cent. or so."

"Do you call that a profitable business?" asked William.

"Well, 100 per cent. is good interest, is it not?"

"That depends upon circumstances," replied William; "it might pay some people, and not pay others. It would not pay you, for instance. You may keep 10 cows on your farm and make $50 a year out of them, but you would not be satisfied to live on that. It might pay a man in the Far West where he could keep 100 or 1,000 cows on the plains, and make very good interest on his money. There is a middle course which is best. It would not pay me or you, either, to keep cows that cost $200 or $300 each, in a barn that cost $10,000, and have them brushed and carded twice a day and their stalls sanded with white sand, and a man in attendance to remove the droppings or dry the floor with a mop on every needed occasion. That is what I call fancy farming, and pays nobody. But in a business way it will pay to make the most out of the land and stock by judicious expenditure. Now, I don't know precisely what our cows cost to keep, but I don't think it is less than $50 a year each."

"How do you make that out, William?" asked his grandfather.

"I have thought over it and talked it over with Fred, and we have made it out in this way:—Six cows pasture over 30 acres in the summer. The summer feed costs nothing more than the interest on the land; that amounts to $180, valuing the land at $100 an acre and interest at 6 per cent. The cow 10 tons of hay worth $100, in the winter, 50 bushels of corn worth $25, which makes, in all, $305.".

"You see the pasture is the greatest item," I remarked; "and your land is not really worth $100 an acre, because it takes five acres to feed one cow."

"The grass is not very good," replied the old gentleman; "it is very old and has never had any seed; it is all wild grass, too, that came in naturally. Many years ago we knew nothing of sowing grass seed, and, in fact, had none to sow, and clover was unknown here, then. Your clover field last year had more feed in it than all my 30 acres of pasture."

"And there were but five acres, which were cut three times, and furnished considerable pasture late in the summer besides. Twelve cows were fed nearly four months in all, from those five acres, which was doing more than four times as well as your pasture did; the meal they had was paid for in the larger quantity of milk they gave than yours did."

"It is a great waste of ground certainly," said the old gentleman, "but what can we do if we don't have the grass?"

"Get the grass on it," I replied. "Your pasture is natural grass land, and would produce twice as much as it now does, if it had a little manure; but if it had some grass seed on it besides and was well harrowed, I think it would produce four times as much feed. If I had that field of yours, I think I could feed 15 cows on it all the summer."

"How would you do it?" asked the old gentleman.

"I would harrow the old sod thoroughly and cross-harrow it until I had it loose enough to take some fresh seed. I would then sow some mixed grasses, as I am doing on a piece of my own low land; for instance, red top, timothy, fowl meadow grass, meadow fescue, creeping bent grass, and some others, all of which do well on low, moist ground; and then top-dress it with fine manure. If this did not succeed as well as I wished, I would put more seed on it and harrow it again, and persevere until I had a thick mat of grass in which a cow could stand to her knees. I would divide the field into five lots of six acres each, and pasture but one lot at a time; I would mow half the ground and by changing from one lot to another, I would have the grass always high enough for a full bite, and fresh and sweet. I believe the ground could be made in this way to feed 15 cows the year round on pasture and hay. Then, you see, the cost of feeding one of those cows would amount to only $12 a year for pasture and hay, instead of $30 which it now costs you."

"How long do you suppose that would last?" asked Mr. Martin.

"I should expect it to last as long as the land was so treated. Why not? If the field as it now is, has been kept in grass for 40 years or more, and still feeds six cows through the summer, why should it not remain two or three times as productive for 40 years more, if it is once made so. And if it will last 40 years, why should it not last a century?"

"What is the reason our grass lasts only two or three years and then runs out?" inquired Mr. Martin.

"Because we sow it only for such a purpose and we do not use grasses that are of a permanent character. The usual plan is to sow timothy and clover. The clover is a biennial plant, and runs out after the second year. The timothy has a bulbous root which does not spread, but grows in clumps and bunches and leaves two-thirds of the soil bare. With several kinds of grass maturing successively, the soil would be fully occupied, and the sod would be green from spring to fall, and indeed through the winter. One of my fields is seeded with a mixture of blue grass, Rhode Island bent, red top, creeping bent, meadow grass, and meadow fescue, and the grass was cut last season several times, and is now green and thick enough to give an excellent bite, if I wanted to pasture it. The sod is only two years old and you cannot see or feel the ground under the grass. It is thickly matted and denser than any sod of single grass I have ever seen."

"You have spent a great deal on that field," remarked my old neighbor. "You put bone dust and guano and plaster on it, and last fall top-dressed it well."

"Certainly," I replied; "and you may see the result. 'Out of nothing nothing comes.' I have said that grass is our most valuable crop, but it is rarely treated as such. It is sown when the ground is worn out by three or four grain crops, and needs a rest. Then, when tired out, we seed the ground to give it a rest, and we complain if it does not respond with vigor. It is exhausted; the seed does not 'take;' we have a half or a third of a crop; and it lasts but two years. If, on the contrary, we treated the grass as we treat a grain or a root crop, what would be the result? We should double the product and we could make our meadows and pastures perennial. I have seen leaves—not stalks—of blue grass three feet long on the old blue grass fields of Kentucky, and there are pastures there which have never known the plow from the day the ground was cleared a hundred years ago, or more, until now, and are never likely to be plowed up. Yet you say grass will run out after two or three years. Blue grass has running roots which fill the soil and form a dense sod, and completely occupies the ground. But the most valuable grass is that of which there are several varieties which furnish successive growth. We cannot have a vigorous growth without feeding it, and I have aimed to feed my field well, in the hope that the grass will pay for the feeding as well as would corn or roots. And it promises to do so."

"It is a mixture of grasses from which the thick growth is made," remarked Dr. Jones. "It is a fact that mixed varieties of plants seem to thrive better together than any single one alone. I have observed this fact in woodland. A beech wood is open, and every lover of art knows the beautiful contrast of light and shade that may be observed when the sun shines through a beech forest. It is so with every single variety of tree; the dense woods are those in which many varieties grow together and crowd each other, each seeming to vie to outgrow its neighbor. In a meadow we can grow twice as much clover and grass as of either alone; and so with mixed fodder crops, as oats and peas, or barley and vetches. I believe the different plants take up different kinds or quantities of food, and one appropriates what another leaves. The fact is so, however, and it is our business to know it and avail ourselves of it."

"I thought you did not approve of pasturing at all, and wanted to feed everything in the yards on fodder brought to them," said Mr. Martin. "Have you changed your mind?"

"I am trying to make my farm carry all the stock it can, and to make as much profit out of it as may be possible. I am not farming for an idea, but for profit. When I began here there was not a blade of grass growing on the farm, and the soil would not produce a grain of rye or a clover blossom. In three years I have 25 acres in good grass; I have 12 acres this spring well manured for roots and corn; an unsightly swamp drained and cleared and part in grass; I grew enough last season to feed 25 head of stock with fodder through the summer and half through the winter, and counting the manure made at what it would cost me to buy it and the increase of stock, I have had all my outlay returned. I have done it all by soiling, and by artificial manure. Nevertheless, to feed stock by soiling is a great care; everything must go on like the best of clock-work; one must be on the watch and the jump all the time; and I must confess I anticipate the time when I can turn my cows out to pasture, with the greatest pleasure. But it will not pay me, unless I can make an acre of pasture carry one cow for six months. That is what I am trying for. My farm was a poor farm. You and all my other neighbors confess it is greatly improved. It is now a moderately good farm, and by-and-by I hope it may be thought a very good one. Time is a necessary element, as I have said before. Grass needs time to grow, and without some good grass fields, my farm would always be a poor farm. This is my creed and I don't pin my faith to soiling or any other system, altogether. I want to do the best I can in my peculiar circumstances. But I can never get along without soiling to a large extent in the summer time; nor can any farmer whose special business is the dairy. And if there is any branch of farming that pays better on a poor farm, or helps to improve its condition better than dairying, I have not discovered it or heard of it; for more goes on to the land than goes out, if the farm and business are well managed. And that it must tell—in time."

STARTING TOBACCO PLANTS.

G. A. GOFF, JR.

I HAVE received some questions on the above subject, which seem to me of enough general interest to justify an answer in the RURAL. I will offer a few hints in regard to the young plants, that I have gathered from my own experience and observation, trusting they may be of use to some who are inexperienced in this line of farming.

The first thing to be considered in raising tobacco plants, is a place to sow the seed—or the "seed bed." For securing early plants the common cold-frame used by market gardeners, is generally employed, which is so well known that it needs no further description. This frame is covered with glass early in the spring, and as soon as the ground beneath, or the bed, becomes dry enough to work, it is forked over and prepared to receive the seed. This preparation should be thorough. The soil should be rich and made friable, so that it will not bake or become lumpy. In making new beds it is best to draw a few loads of rich soil or muck from some rich spot and apply it to the bed. Such soil may be found in the woods or often under old stables; but in either case it is likely to contain seeds of weeds, which are sure to make trouble unless some precaution is taken against it. This is best accomplished by preparing the bed the previous season, frequently forking it over to give the weed seeds a chance to germinate and then be destroyed.

If plants large enough to set are desired before the 10th of June, the seed should be started or "put to sprout" by the 1st of April. One-third of a pint will sow 200 square feet of bed, and will, with good success, furnish enough plants to set three acres. Mix the seed with muck or fine sand, and place by the stove till sprouted, being careful to keep the mixture moist and warm. When sprouted, sow the seed evenly over the bed and carefully rake in with a fine-toothed rake. The seed must not be covered deep, or it will not grow. Indeed, many do not cover the seed at all, simply sowing it on the surface. In either case it should be well "firmed" down with a wide board. In a week or ten days the young plants will begin to show themselves. At this stage of their growth they are exceedingly tender, and care must be exercised to keep the surface of the soil from becoming dry. Tepid water should be used for watering the bed, and it should be applied with a sprinkler having a fine rose; otherwise the seed will be washed out and destroyed. Until the leaves become as large as a silver dime the growth is very slow, and about half of the time of the growth of the plants while in the seed-bed, is consumed while they are attaining this size. After they have done so, the growth is more rapid if circumstances are favorable, and in a few weeks the leaves will be as large as a common tablespoon, when they are ready to be transplanted to the field. Nothing is gained by setting small and sickly plants.

In regard to growing plants without glass, good strong plants may be produced in the open ground. Of course, they will not be as early, but they will be tougher and better able to stand transplanting. Growers who plant a considerable amount of tobacco should have some early plants, so as to have a succession of settings, and therefore must raise some plants under glass; but where only an acre or so is to be planted, enough plants can be grown in the open ground to secure a setting, and with careful management they will be early enough to set by the 20th of June, which in this latitude will, in most cases, give the plants time to make their full growth before autumn frosts. In summing up; we find four points essential to success in securing a bed of strong, healthy, and early plants: 1, a properly prepared seed-bed, with a rich, mellow, and friable soil; 2. an even sowing of seed, the proper thickness, having first been sprouted in muck or sand by a fire; 3, close attention to the plants during the first four weeks after sowing the seed, with frequent sprinklings with tepid water; 4, keeping the bed free from weeds during the whole season.

If these rules are strictly followed, there need be no fear of failure to secure an abundance of strong, healthy plants, which will be one great step towards growing a successful crop of tobacco.

Chemung Co., N. Y.

SOME OF OUR LEADING GRASSES.

PROFESSOR W. J. BEAL.

THE writer has long entertained the idea that farmers limit themselves to too small a number of grasses and clovers, especially when we consider the great diversity of our soil and climate. There are several reasons why farmers raise only a small number. The seeds are not in the market, or if they are, some of them are costly, often too much damaged to grow, and very likely not true to name, or mixed with seeds of foul weeds. Another prominent reason for the selection of a few species is the fact that many of them look much alike and cannot be distinguished by any but a botanist.

When there is a demand for these grasses, and only good, true seeds find sale, some one will supply the market. Owing to the reasons named, but few persons are bold enough to leave the beaten track and try anything except timothy and red clover, and, perhaps, one or two more species. Home-grown seeds are likely to be the most desirable, as they are less likely to contain seeds of foreign weeds.

The number of our native grasses is much greater than is generally supposed, a single State, like Michigan or Illinois, containing not far from 120 species, to say nothing about as many more sedges and rushes which much resemble true grasses. A grass is not necessarily the best adapted to a country because it is a native of that country. Look at our weeds and some other introduced plants, and see how they drive out our native plants.

The cuts of grasses in the Report of the Agricultural Department for 1878, are excellent. The Editor of the RURAL has had some of the most important cuts reproduced for the benefit of his numerous readers.

BROMUS UNIOLOIDES—Schrader's grass, Rescue grass. The genus Bromus includes the chess, or cheat, which is often troublesome in wheat fields. The species first named, is an annual in the Northern States. Several spec

of Bromus have been highly commended from time to time by the press, and especially by some seedsmen. The seeds are large and easily collected; the grass is a rank grower. The quality of all with which the writer is acquainted (some dozen or more species) is quite inferior. The grasses are coarse and not very nutritious. The species under consideration is one of the best, and has often been freely disseminated. Our common cheat, or chess, was once advertised as Willard's bromus. In the report from which our cut is taken, the grass is now highly spoken of as a winter grass for the Southern States. At that time of year any green pasture is desirable. For this purpose, one writer in Texas "regards this grass as a wonderful and most important discovery." In Georgia, where it has been tried, less is thought of it than when first introduced.

Turnips Among Corn.

It is a well-known fact that people are more willing to tell of successes than failures, and for that reason I would like to tell the readers of the RURAL how I raised a good crop of turnips without much expense.

As our land is mainly devoted to grazing or meadow, we do not expect to obtain a good corn crop without manuring in the hill. The kind commonly used is hog-manure and the manner of raising turnips is to scatter the seed over the load while loading up, and that is all there is of sowing the seed.

The next care they will need will be to thin them out when the corn is hoed. I sometimes leave as many as three, but commonly only one plant in a hill.

As the main part of the growth is in the fall after the corn is cut up, I think they are a better and more profitable crop to grow among corn than pumpkins. In harvesting, I usually drive through the field, pulling several rows at a time and throwing them, tops and all, into the wagon, haul them to the barn and unload on the floor where the tops can be cut off at leisure and the roots taken to the cellar or pit. My crop, this year, was about 140 bushels per acre; the corn crop 100 bushels of ears per acre, which was quite as good as my neighbors', if not better. I have tried several varieties and find Rennie's Prize, the best, as it grows to a good size, is smooth, a good keeper and excellent for the table or stock—only it does not cook as readily as some other sorts. M. E M.

Pomological.

PEACHES AT THE NORTH.

The idea has been, and still is prevalent that there is no object for Northern farmers to try raising peaches. That the peach is our most delicious fruit all admit; that the trees are easily grown, all acknowledge; that the climate south of 42½° of latitude is not too severe usually, is also true. But still few have any confidence in the practicability of raising this fruit. Occasionally an inquirer wakes up to a determination to try. How shall he do it? There are obvious difficulties; let us look at them.

First, the Yellows—an insidious disease which has been the great drawback in peach growing for at least 75 years; a disease contagious and hereditary. How shall we elude it? I desire to say here, in passing, that there has been great negligence or criminality among propagators in the selection of seed for planting. It is a well known fact that in the peach regions of our country great quantities of peaches, which from inferior size and premature ripening, are unfit to ship to market, find their way to canning or drying establishments where they are used, and hundreds of barrels of pits are there accumulated and held for sale at a very low rate. These have been used to a great extent in producing the young trees which have occasioned so much disappointment to the peach growers of our section; for be it remembered, a diseased pit can only produce a diseased tree. Now what can be done about it? Make no purchases of trees unless you have a clear pedigree, so to speak, of the health and purity of the seed. It is not enough that it comes from North Carolina, West Va., or Tenn., you should have convincing proofs that it has come from orchards of natural seedlings, in which no disease or premonitory symptoms thereof have ever showed themselves. Having trees produced from such seed, raised on new land, budded from trees of untainted health and set remote from any diseased trees, there is every reason to expect success and with good care and cultivation there will be little occasion for failure.

Second, another fruitful cause of failure, even with good trees, is the peach borer. The trees should be carefully examined in spring and in September, and every borer removed. A free application of oyster-shell lime is excellent about the collar of the tree as a preventive. A wash of tobacco lye or a strong soapy application is excellent for the same purpose. Vigilance and promptness are all that are needed to circumvent this difficulty. We should cultivate the ground every year, at first planting some such crop as corn, potatoes, onions, or some other root crop; or beans, peas, tomatoes, or even buckwheat, but we should not allow grass, rye, wheat, oats, or any other cereal.

When the trees begin to bear, cultivate shallow, manuring sufficiently, but drop all other crops and secure choice peaches only. It is well not to disturb the ground after July, in order not to induce a late growth of wood, so as to secure well ripened wood and mature buds for the next year. A growth of young wood and a very rampant and succulent growth are two extremes to be carefully avoided, and the *golden mean*, between the extremes, is the sure ground of safety and profit.

SCHRADER'S GRASS—BROMUS UNIOLOIDES.—FIG. 103.

Manures suited for the Peach are:—well rotted stable manure in moderate quantities, bone dust or bone meal evenly dressed over the entire surface, ashes, or in the absence of these, muriate of potash. A free application of oyster-shell lime upon the entire surface is a healthful dressing. Tobacco stems, too, are good; but all these should be used with care and prudence.

He who lacks all faith in Peaches should try the Troth's Early, Mountain Rose, Old Mixon, Stump the World, Barnard, Crawford's Early and Late. The early Northern Peaches are in close competition with better varieties from the South. Troth's Early, though not equal to some later sorts, has been remarkably healthy and productive with me. The Old Mixon I regard as a very hardy, healthy and productive variety. But the number of choice sorts is numerous and the above list can be increased at the taste and will of the planter

When an orchard has passed a series of productive years and finally declines, so as to need removal, do not cut down the trees; rather take your team and, with chains about the head of the tree, pull it out. It is easily and quickly done, and then the field is fit for Pears, Apples, or any other trees, except Peaches, which should not again be planted within a period of 16 to 20 years. But the small expense of even the best Peach trees, and the slight labor of removing them when past profitable bearing, are amply repaid even by three or four crops of fruit, if we can feel sure of so much. P. M. A.

Middlefield, Ct.

CHINESE PEARS AND CROSSES.

About forty-five or fifty years since I received the "Sha lea," or Chinese Sand Pear, from the late Wm. R. Prince, of Flushing, L. I. The tree made a vigorous growth, and soon came into bearing, producing bushels of its beautiful large fruit. As this never became soft, we didn't know what it was good for, as it was not salable in a raw state. I raised many seedlings from it. These grew up four to six feet the first season, and I thought I had some valuable stocks to work other varieties on, but I soon found that though grafts of other Pears would not do any good on these stocks—they would barely live, but did not flourish—yet these Pears grew and throve on other pear stocks quite freely.

Some of these seedlings I have fruited, and in the appearance of trees and fruits, they are very similar to the original "Sha lea," but the fruit becomes more soft, and the trees bear heavy crops annually. Neither blight nor insects have ever affected trees or fruits. Lately we have found these Chinese pears excellent for canning, and especially for preserving, and for these uses they are superior to all other pears. Being very sweet, they require less sugar than others.

In a late issue of the N. Y. Weekly Tribune, Mr. Charles Downing describes the Le Conte Pear, which is evidently a cross, as is the Kieffer Hybrid and several others. Mr. Prince also had another Chinese Pear, which he called the "Suet lea," or Chinese Snow Pear, so that some of the crosses may be from this strain. A friend in Indiana informs me that he has now nine varieties, and knows of several more. There is a great prospect that by crossing these Pears with some of our sweet Pears, new varieties of great value may be produced. T. B. G.

Dairy Husbandry.

STANDARD FOR DAIRY COWS.

PROFESSOR I. P. ROBERTS.

Will It Pay To Keep a Milk Record?

I find the following in the N. Y. Tribune:

— Professor I. P. Roberts, of Cornell University, according to Professor Arnold, originated the excellent idea of A STANDARD FOR DAIRY COWS BASED ON ACTUAL PERFORMANCE, when at a meeting in Utica three years ago he remarked that "A cow weighing 1,000 pounds to be called good, ought to give annually 8,000 pounds of milk." Mr. Solomon Hoxie, of Whitestown, was impressed with this view, and applied it practically to the improvement of his own herd; and subsequently Mr. W. L. Rutherford took a step further by suggesting that the enterprise be given a scope including the whole country. Thus started and getting into print, the idea found numerous supporters, and finally took form in the "National Dairy Cattle Club" But this new organization, Professor Arnold thinks, has aimed too low. * * * *

The late discussions at public meetings bring this matter directly before the interested public, and I am glad of it, for I am tired of long pedigrees that are "too thin" to hold milk. I find, by reference to my notes, that, two years prior to the date given above, I suggested to my class in Agriculture the desirability of keeping a milk record with every cow. For several years I have been weeding out our dairy by simply weighing the milk for short periods. More than a year ago, I commenced to keep a systematic record with all cows that from former tests were considered worthy of a place in the dairy.

In the following table is given the record of four cows that have completed the year, and also the record—so far as made—of two young half-blood Holstein heifers. The record is given in the exact form in which it is kept in the dairy ledger, except that numbers are used instead of names to designate each cow. I hope it will give some useful hints as to form, to the thousands who, I trust, will from this on keep a record with all their cows, except those already condemned.

Name or No.		Breed.	Age.	Average weight.	Date of calving.	Marking of calf.	Sex.	Blood of calf.	Milk record began.	Estimated yield.	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Total	Times weight of cow.	Due to calve.	Dr.	Cr.

" 6		"	19 mths.	948	Sept. 18	V.	C	¾ H	Sept. 23										196½	690½	585½	607½					

In the column marked "estimated yield" is recorded the amount of milk given—based on the subsequent yield—from the time of calving (less five days) to the time of removing the calf. All of the cows have been used for about one-half of the year for experimental purposes. Their rations were thus of necessity quite varied, sometimes hay alone, and at one time, hay with one-half bushel of meal per cow, per day. Cow No. 4 was gradually fed apples till she refused them, after eating 56 pounds per day for ten days; at which time she had perceptibly fallen off in her milk, but she recovered rapidly and gave her normal quantity at the end of one week. Subsequently *cut* food *dampened* raised her yield to nearly that of August. The milk of the dairy is sold at an average price of two and one-fourth cents per pound. The cost of delivering is one-fourth of a cent per pound.

No. 1 cost $45; No. 2, $35; No. 3, $45; No. 4, $30. No. 2 would usually be considered a *good* cow. I bought her for such, but No. 3 not only gave as much, but an *excess* to the amount of $48 53. This is more by $3.53 than the first cost of the cow.

Will It Pay To Keep a Milk Record?

I propose now to analyze the milk of each cow so far as to determine the amount of solids. Since the little seed—(sentence) "A cow weighing 1,000 pounds to be called good, ought to give annually 8,000 pounds of milk," is, under the fostering care of such men as Hoxie, Rutherford and others, about to produce such an abundant harvest, let me drop another one, trusting it will fall in as good ground:—"A man to be called a good dairyman should never—except for a short time in extreme cold weather—allow his milch cows to be in a temperature below freezing. Below is given the average daily temperature taken at 5:30 A. M. and 5:30 P. M., beginning Sunday Jan. 25th.

	Out-of-doors.		In the Cow Barn
Sunday,	34 degrees		48 degrees.
Monday,	33 "		56 "
Tuesday,	39 "		54 "
Wednesday,	36 "		57 "

Friday,	22 "	Very windy	48 "

Cornell University, Ithaca, N. Y

THE FAIRLAMB SYSTEM, AGAIN.

As a constant reader of the RURAL, and one feeling much interest in the improvements amongst dairymen, I cannot avoid taking issue with your correspondent, D. W. C., in the RURAL of March 6th, upon the system of gathering cream for creameries. I am willing to admit the patron who supplies a creamery with milk of a rich quality at the same time that his neighbor furnishes a poorer article, does not receive his just award in the returns of his butter, but the plan described has not, as is claimed, "solved this whole question."

Dr. Sturtevant, of Mass., shows a difference in quality of cream quite wonderful, running from 18.18 per cent. to 56.80 per cent. of butter, the latter from cream of the Jersey cow, the next highest being 42 per cent. He says, "We find from these analyses that some creams may yield three times as much butter as other creams. In other words, that milk yielding 10 per cent. of cream may furnish more butter than another indicating 30 per cent. of cream," and he concluded further "that there is not necessarily any connection between the cream percentages and the butter yield." The modest cow with a small percentage, *may* make more butter than the vaunted cow which is supposed to average 25 to 30 per cent. of "cream." Prof. Voelcker presents similar facts.

Mr. Willard states, "cream varies in composition according to the circumstances under which it is produced, and as a consequence of these differences in the composition of cream, *variable quantities of butter are produced from a given bulk of cream.*" Prof. Arnold adds this testimony: "It must not be understood that cream is all supposed to be alike in respect to gravity or value, for *neither is true.*" The italics are mine, and I could add further testimony did I consider it necessary. Now pray tell me, with these facts before you, what advantage has the Fairlamb system over the usual mode of delivering milk, so far as justice between patrons is concerned?

Again, we know dairymen are mortal and we *have* known of instances where they have watered their milk, even in the face of a stringent law to punish the offence, and is it at all unlikely that some mortal of a farmer would water cream when it can be done without fear of the law, and in the manner in which I will exemplify as follows: Take a given quantity of milk thoroughly mixed and divided equally into two of the vaunted glass guage cans; mark them Nos. 1 and 2. Set No. 1 in the usual way for raising cream, be it in spring water or a cool cellar. No. 2 is plunged into an ice bath and at the end of two hours, if the milk is warm from the cow when placed in the cans, you have fully 20 per cent. of cream to let Mr. Teamster skim from your can No. 2, provided you time your work for the calling team. No. 1 can, after setting the usual time of 12, 24 or 36 hours, only gives 15 to 16 per cent. of cream which has, like the nature of the beast that produced it, moved slowly and perchance gracefully to its resting place, while the cream of No. 2 has rushed along like a worried cow, and carried milk with it—has in fact *watered itself.* Let No. 2 set 12 hours longer and the cream will show only 15 to 16 per cent.—the milk has returned to where it belongs.

To my mind the "Fairlamb system of gathering cream" is not the *Ultima Thule* of justice to dairymen patronizing creameries. D. C. O.

Jersey Milk for Babies.

Because Dr. Hoskins has failed to discover in his inquiries any instance where Jersey milk has been found to be unsuited, or in other words, indigestible for a young child or a calf, he assumes that Dr. Sturtevant and others are mistaken when they insist that it is. We must remind Dr. Hoskins that there may be a difference in Jersey cows, and in stomachs. We believe we were the first, nearly three years ago, in the N. Y. Tribune, to assert that in some cases, Jersey milk was unsuited for young children. A baby at the time was being fed on Jersey milk, and although the child was more than a year old, and had been perfectly healthy while nursing, the Jersey milk made it sick. A change to Ayrshire milk corrected the trouble. Probably if the milk had been diluted by making it one-third water, there would have been no trouble. A number of years ago, we nearly lost a Jersey calf by allowing it to suck its mother. When changed to an Ayrshire cow, the scours ceased. Care should be had in trying to rear infants on Jersey milk,—outside of Vermont; at least this is our experience. F. D. CURTIS.

The Herdsman.

NOTES FROM MEADOW GLEN FARM.

Spring Management of Sheep.

THIS is an important and busy season for the sheep farmer, especially if he expects early lambs. The ewes require close watching, and their feed should be increased for two or three weeks before they drop their lambs, in order to increase their milk yield afterwards. Ground oats and wheat shorts made into a slop are very good. They should not be allowed to run out on the bare ground, as the sight of the grass tends to make them uneasy, and takes away their appetite for dry feed. As the lambing time approaches, it is quite necessary to keep them as quiet as possible, and now comes the advantage of having a tame flock, so that one can pass around and among them without causing any alarm or crowding one upon another. If they have been handled rightly from the time of mating, there will seldom be any trouble in lambing; but in case there should be, those who are inexperienced should send for some one who understands the trouble.

After the lambs are dropped, the ewes should have the best of feed; for, as a rule, it is better to increase the milk in the ewes than to force the lambs to eat anything beyond what nature has provided for them. All manure and wool should be removed from the udders of the ewes, and they should always be tagged before they are turned out to grass. Should there be many twins, or, should the ewes be poor nurses, the lambs should have extra feed, such as that given by a new milch cow. This should be fed, while warm, from a bottle through a rubber nipple. If it is necessary to raise a lamb by hand, it can be taught to drink milk as well as a calf. As the lambs grow older, they may be taught to lick oat and corn-meal with a little salt, keeping it in a separate pen with an opening large enough to admit the lambs, but too small to let in their dams. Lambs that are to be raised should be docked, and the buck lambs that are to be fattened should be castrated when two weeks old, for at that age the operation causes them but little pain. It is needless to say that the flock should be kept from all storms or cold winds at this season, yet there is nothing they enjoy more than sunshine.

A Profitable Ewe.

We have a Cotswold-Merino ewe two years old, which dropped a pair of twins—buck and ewe—on April 12. The buck when sold to the butchers, weighed 77 pounds, which, at five cents per pound, brought $3.85; the ewe lamb was raised and valued at $5, which is a low price. In addition to this the dam sheared nine pounds of washed wool which at 33 cents per pound, made $2.97, so that this ewe yielded last year a total gross income of $11.82.

Ugly Bulls.

In the RURAL of Feb. 28, Col. Curtis recommends tying ugly bulls with a slip-noose; will he explain what kind of slip-noose is to be used. We would find it difficult to sleep well if we had left one of our bulls tied in that way. The old adage, never to trust a bull, is a good one. ABEL HOYT & SON.

DEVICES FOR MANAGING STOCK.

ON small farms where but few cattle are kept, it is always better that each animal should be "halter-broke;" yet it often occurs that a wild or refractory one is to be removed

FIG. 104.

from one locality to another. This is usually an easy matter when several head are to go together; but when the unruly one alone has to go, it sometimes proves quite a difficult undertaking, and results in ill-temper all along the line of men, boys and dogs, if not in injury to the beast. If a cow is to be driven along an unfenced road through woods, she can be prevented from straying away from the path by securing a strong pole to the horns—fig. 104. Another effectual means of controlling a wild steer, is by a strong surcingle around the body, through which two ropes attached to the fore-feet pass, of such length that the driver can walk behind the animal—fig. 105. When any attempt to run is made, pull the beast up and

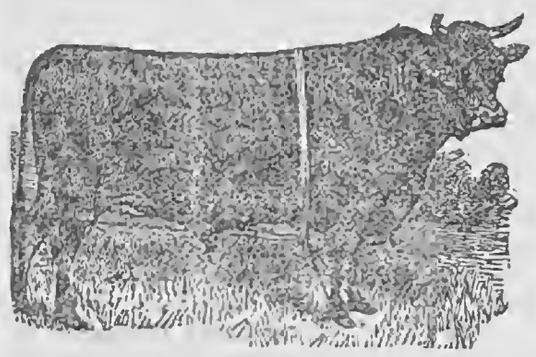

FIG. 105.

he comes down on his knees, and soon finds himself in the hands of his master and goes quietly along. I once owned an ox that could not be trusted to obey when even a few fee away. A few lessons with the ropes made him obedient and safe.

Another little device I have in use is what we

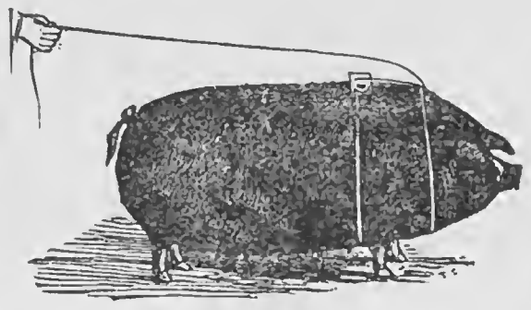

FIG. 106.

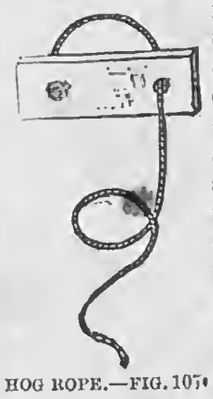
call a "hog rope"—fig. 107. A little block of oak or hickory, three inches long, an inch and a half wide, and half an inch thick, has a hole near each end, large enough to allow the rope to run easily. Make a knot in one end of the rope; pass the other end through one hole and back through the other, and you have a "slipnoose" that is reliable. To secure a pig by the nose, place the wood so that it draws flat across the roof of the mouth. A much better device than a rope on the hind foot, for the purpose of leading a pig, is to slip the noose around the pig, just behind the fore-legs, with the block on the back; then take another turn around the neck, and you have him haltered in the best way that a hog can be—fig. 106. M. B. PRINCE.



HOG ROPE.—FIG. 107.

The Swine-Herd.

FEEDING SWINE.—No. I.

A Letter from Dr. J. B. Lawes.

The RURAL NEW-YORKER of the 17th of February, contains an article upon pig feeding, written by Professor E. W. Stewart, which appears to me to call for some comment. I do not feel the same hesitation in writing upon this subject, as I should in writing on many others connected with agriculture in the States, for the United States pig, if his ancesters did not emigrate with the Pilgrim Fathers, has, at all events, a very close relationship with the British pig of our own day.

It has been observed that emigrants from this country after a few generations of residence in the States, lose that rotundity of form and aptitude for laying on fat which are generally supposed to be characteristics of John Bull. Whatever may have been the origin of the United States pig, a residence in that country has not in any way reduced his appetite or impaired his digestion.

Professor Stewart, in his article, refers to some experiments made by a committee of two Farmers' Clubs in Connecticut, and also incidentally alludes to experiments in pig feeding made by me at Rothamsted.

The Connecticut experiments were to test the comparative value of corn meal, corn-and-cob meal, and whole corn. The only one of these three particular foods which was employed in the Rothamsted experiments was corn-meal, and our results agree very closely with those obtained by the use of the same food in the experiments carried on by the committee of the two Farmers' Clubs in Connecticut. The committee obtained an increase of one pound of weight by the consumption 4.34 pounds of corn-meal, and my results show an increase of one pound by the consumption of 4.90 pounds of the same food. The States' pig had, therefore, all the fattening properties of the English, and a little over.

Professor Stewart finds fault with the prevailing idea that pigs thrive on the most concentrated food, which he characterizes as "perhaps the error leading to the most disastrous consequences," and he further adds "this error has not been confined to unthinking farmers; for the experiments of Dr. Lawes, of Rothamsted, and of Dr. Miles, at the Michigan Agricultural College, in pig-feeding, were conducted wholly with concentrated food in determining the value of corn-meal, etc."

Professor Stewart is quite mistaken in stating that the Rothamsted experiments were conducted wholly with concentrated food—amongst many other kinds of food, we made use of bran, for instance, which the Professor says is an excellent food to mix with corn-meal; and I give the results of two experiments—one with corn-meal alone, and the other with two pounds of corn-meal per day to each pig, with bran *ad libitum* in addition.

It took 491 pounds of corn-meal to produce 100 pounds of increase in live weight; and it took 405 pounds of corn-meal, and 496 pounds of bran to produce the same amou of increase.

The pig is a remarkable animal: nothing comes amiss to him, from a baby in a cradle to green food, or any refuse matter; he has, however, a very small stomach, and, if required to fatten quickly, must be furnished with a very concentrated food. This may be illustrated by the two following tables, published by me many years ago:

	Proportion of Stomach in 100 lbs. live weight.	Per 100 lbs. live weight. Dry substance consumed as food.	Per week Increase.
Oxen	51 oz.	12⅕	1.13
Sheep	39 oz.	16	1.76
Pigs	14 oz.	27	6.43
Man	6 oz.	..	..

In this table the animals are supposed to be fed with the most appropriate food: the pigs on corn, or barley meal, the oxen or sheep on roots, hay and corn, or linseed cake, and it will be observed that the pig, with his small stomach, can consume double the amount of food, and increase nearly six times as fast as the ox. It is evident that these two animals are adapted to consume different sorts of food; the ox gets nourishment out of a bulky diet, such as hay, straw, etc., while the pig thrives on a concentrated diet consisting principally of starch. When a pig increases one pound for each 4.34 pounds of corn meal consumed, as was the case in the Connecticut experiments, it is evident such food must contain very little indigestable matter, for it requires 2½ pounds of starch to produce one pound of fat, and as a very large proportion of a fattening pig consists of fat, the amount of residue required to support the vital functions of the animal, is not very great.

The practical conclusion that we arrived at from our experiments was, that the most suitable diet for a fattening pig was barley meal, or food of a very similar composition. Compared with corn meal, barley meal may be said to contain 2.60 per cent. of mineral matter, instead of 1.6 per cent., the quantity found in corn meal. It also contains a very small additional proportion of nitrogen, and a little more indigestible woody fiber. Some of the pigs fed exclusively on corn meal became unhealthy, and we thought the smaller amount of mineral, or indigestable matter contained by the corn meal as compared with the barley meal, might possibly be the cause. Barley meal, which is the principal fattening food used in Great Britain, is certainly a perfectly healthful food.

Professor Stewart, in conclusion, appears to connect corn-meal feeding with certain diseases in pigs, and it may be possible that barley meal is quite as concentrated a food as a pig can fatten upon consistently with perfect health: the addition, however, of bran in the proportion of one-seventh, or one-eight, to the corn used, would probably be quite sufficient to bring its feeding powers up to the standard of barley meal. It must, however, be borne in mind that the consumption of food and the rate of increase in the animal fall off greatly when much indigestible food is used. If an increase of one pound live weight for 4.34 pounds of meal, can be obtained, without injury to the health of the pig, I should, if I were farming in the States, be reluctant to make any change in this diet.

Rothamsted, Eng., March 8.
